PARIAN CEMENT. NINE ELMS BRAND.

MADE BY THE PECULIAR PATENT PROCESS.

Strongly Recommended, after 30 years' experience, for DAMP WALLS, on a backing of Portland, and as the ONLY SAFE CEMENT, capable of being PAINTED and PAPERED within 24 HOURS.

LARGELY PREFERRED FOR HOSPITAL WALLS & CEILINGS, BEING NON-ABSORBENT & NON-EFFLORESCENT.

TESTIMONIAL.

37 NORFOLK STREET, STRAND, W.C. : April 9, 1880.

DEAR SIR,—The Parian Cement which has been used extensively in St. Thomas's Hospital, and of which a large quantity was supplied by you, has given great satisfaction, and is, I believe, generally acknowledged to be the best material for lining the walls of hospital buildings. Its hard, smooth surface admits of being readily cleaned, which I need hardly say is of great importance.

I am, Dear Sirs, yours faithfully,

Messrs. FRANCIS & Co.

HENRY CURREY, ARCHITECT.

Sole Manufacturers:—FRANCIS AND CO., VAUXHALL, LONDON, S.E.

The Architect.

A NEW POINT IN ARCHITECTURAL COMPETITIONS.

THE introduction of the professional adjudicator into the scheme of architectural competitions may now be considered an accomplished fact; and we have to discover whether the consequences are to be wholly advantageous or very considerably prejudicial. The great majority of those who were more directly interested, namely, the competing class, were exceedingly hopeful, it will be remembered, a year ago. One might almost say they expected for the future, as the result of professional adjudication alone, not only the bestowal of a prize upon each one of the competitors, after the ingenious manner of certain very small academies for very small young ladies and gentlemen, but the success of every competitor against all the rest, as a general reward of merit, and an opening to everybody once for all of the road to fortune and fame.

A minority, on the contrary, composed of men who had most of them more or less borne the burden and heat of the day, and discovered by their own sad experience of competitions the vanity of human wishes, persisted in expressing, in what was thought by their more light-hearted opponents to be rather a cruel manner, a much more melancholy expectation. The professional adjudicator, they said, after all he could possibly do in the way of "fair play," would be found to have accomplished nothing more than a change of the form, and nothing less than an augmentation of the amount, of the same misfortune—the same universal disappointment which had so long thwarted the best laid schemes of mice and men in these insidious and infelicitous contests of skill.

There were two leading architects who in the discussion of the matter at the Institute took up a very decided position. Mr. BARRY, whilst personally possessed by the idea that competition was in principle a failure, encouraged the hope that, if promoters could be induced to avail themselves of the advice of a professional adjudicator, such as (to speak very plainly) he himself was known to be, something equivalent to justice would be done by the interposition of authority—that kind of authority which in so many human controversies puts a stop at least to the inconveniences of further debate. Mr. CHRISTIAN, on the other hand, cherishing the notion that in his own case a deserving man had been raised out of obscurity by means of competition, held that other persons like himself might expect to reach the same goal by the same road, and advocated therefore without reserve the perpetuation, extension, and intensification of competition, by means of the establishment of professional adjudication (let us speak plainly again) in such hands as his own. To all, therefore, who would study the working of a contrivance so promising, under circumstances of unembarrassed simplicity and unimpeachable control, we say—Let them now contemplate with awe the case of the proposed new "Church of All Saints (West St. Matthew's) at Ipswich."

A month or two ago anyone who might be gossiping about the doings of miscellaneous architectural people in London would be told that there was a great church competition on foot which "everybody was going in for." It was for a church at Ipswich; men were not very busy, many of them were far from busy, in fact some were very short of work, and they were "going in for" this church in large numbers; there might possibly be as many as a hundred designs sent in.

The designs, as we learn, have now been duly delivered. They are not quite the round hundred in number, but there are said to be eighty-five of them. The promoters are in fact overburdened with them, they are so many; there are actually *some five hundred and sixty sheets of drawings*. The municipal authorities have been appealed to for the use of rooms large enough to exhibit them. The citizens of the town are astonished—in a commercial way—at the absurd immensity of the display. The local press speaks of "the enormous waste of labour involved," and produces a very moderate calculation to

show "1,600*l.* worth of talent thrown to the winds." But Mr. CHRISTIAN is to act as professional assessor, and we are bound to believe that all will turn out well somehow.

Perhaps it is not worth while to inquire in a preliminary way what is the practical position of the enterprise itself, upon which our eighty-five architects have permitted themselves "to lay out their money," as sporting men say, "so freely." But if anyone cared to be so pragmatical, for the sake of argument the inquiry may find an answer in the *East Anglian Daily Times*, the local journal already referred to. "We believe," says this no doubt well-informed authority, "that the scheme for the new church is at present little more than *in nubibus*." Upon this statement, taking it of course financially, we ourselves cannot say anything; but one thing which unfortunately we can say, or must confess, is that architects seem to be any day, not only willing, but urgently anxious, to submit designs for a church or any other edifice, to the number of eighty-five, or to any other number more or less than eighty-five, according to the particular circumstances of a case, without apparently caring a button whether the project of building has this shape or that, or any shape at all that is substantial. That each one of the number is simply what the schoolboys call "cocksure" of beating all the rest, provided only that fair play can be had, is the plain English of the situation; and that this motive power is quite sufficient to propel the contest to its natural end no one acquainted with the mathematics of poor human nature would think it necessary to doubt. Therefore, when we have here our eighty-five competitors "throwing 1,600*l.* worth of talent to the winds," merely upon the strength of Mr. CHRISTIAN being the judge of their comparative merits, all we can say is that, if the money were twice as much, the adventure is explained.

But is it actually the fact, some readers may say, that architects will knowingly rush into a costly competition in this way for a "scheme" which is "little more than *in nubibus*?" Let us suppose a case. The Ipswich paper tells us, with respect to "the new church of All Saints (West St. Matthew's)," that a few years ago a new "district" was formed and then constituted a parish; that "an energetic vicar was appointed, and a congregation secured in a temporary church"; that "the vicar and churchwardens aspire to a permanent building"; and that the present competition is the consequence, with all the embarrassment it has brought upon "the astonished and grievously burdened vicar and committee." Let us suppose, therefore, that some young clergyman has been recently appointed to take charge of a "district," with a "tin-tabernacle" or iron church, in the suburbs of any town the reader pleases to suggest, and that he and his friends "aspire to a permanent building." Let us suppose that they advertise for designs, offering two or three small premiums, or none at all (it is quite immaterial which), and appointing a professional assessor. Are we to believe that competitors will send in designs without even inquiring whether the promoters have got the money? The "energetic vicar of All Saints (West St. Matthew's), Ipswich," specifies for the cost of his new church 5,600*l.* Has he got the 5,600*l.*? If not all, how much of it has he got? Does Mr. CHRISTIAN think it proper to ask this question if the competitors do not? Suppose the young clergyman of our own illustration to have not one shilling in hand, would Mr. CHRISTIAN allow his name to be used as a bait to competitors if he were aware of this fact?

Our present purpose is no more than to raise this question as a new point. If we say, the competition system is to be rehabilitated by the introduction of the rule of professional adjudication, how far does the professional adjudicator become responsible for the character of the contest? The real prize, as everybody knows, is the employment. Mad as competitors may be, they are not so mad as to "go in" for absolutely nothing but academical success, or even a nominal premium. When Mr. BARRY took in hand the Glasgow and Birkenhead competitions, there was no possible question of the materiality of the prize of employment; but if the Ipswich case be really a "*scheme in nubibus*," how far should Mr. CHRISTIAN lend himself to it without inquiry? We do not suggest impropriety, we merely ask the question. No doubt an answer may be found in the irrationality of the competitors. Possibly it may be deemed preferable to say simply that the professional assessor is only concerned in earning his own fee. At any rate let the point be considered, lest it be found presently that the intended benefit of professional judgment turns out after all to be only an additional snare.

ESPOSIZIONE DI BELLE ARTI, ROME.—II.

[BY A CORRESPONDENT.]

ALTHOUGH it is not absolutely necessary to the immediate object of this paper, I should like to make a short addendum to the account given in my last of the picture *Il Voto*, by F. P. MICHETTI, which is exciting so much attention in Rome, by reproducing the substance of a letter written by a friend of the painter, which has recently appeared in one of the daily papers. It seems that even amongst Italians, such of them as have been city bred and nurtured, the material of the picture has been questioned, doubted, and misunderstood, though it cannot be so to those who have visited the more primitive and remote parts of the country. The writer of this letter assures his readers that it is a faithful representation of a scene really enacted and horrible to witness, which is repeated every year on the day sacred to S. PANTALEONE, the devotion to whom, it is stated, is identical in its object with that paid to PRIAPUS and VENUS by the ancient forefathers of this people. He describes it as one of "fury and abandonment to frenzy, a sight to make the hair stand on end." He says that it was in the month of August last year that the painter went to Migliano in the Abruzzi, three miles from the coast of Francavilla, in a fertile country, and containing two thousand inhabitants. He arrived on the day of the festival of S. PANTALEONE, and immediately occupied himself with recording the typical characteristics of the people. When the religious procession started to perambulate the streets, the painter followed, noting down with his pencil everything that he could. At one point, when the length of the procession was before him, he begged of the mayor of the town to request that it might be stopped for a few moments in order that he might complete his sketches. This was accordingly done amidst the grumbling of the people, who had long watched the painter's movements and occupation with disapproval. As they returned to the church the sun became overclouded, and there fell a heavy storm of hail with thunder and lightning, doing much injury to the crops. Scarcely had it subsided before the people rushed out of the church, believing that it was thus the saint had expressed his indignation against the profanation of his festival by the irreverent painter, and strove to kill him amidst infuriated howls and execrations. And this they would assuredly have accomplished had not he made good his escape, and fled to Francavilla with his studies under his arm.

To return to our inspection of the Exhibition. On the ground floor there are several rooms for the display of pictures and engravings already exhibited, called "retrospective." Most of the pictures belong to the early part of the present century, in the worst decadence of art, and cannot lay claim to much artistic value. Neither are the drawings or engravings anywise remarkable as a collection. We have the well-known steel-plate engravings of the *stamperia*, or government printing-office, the engraved works of ALMA TADEMA, and some clever etchings by J. H. BRADLEY, though these latter are rather overprinted.

The architectural plans exhibited here are all slight and more or less unimportant. Whether it be that the national architectural energy has expended itself in the recent contest for the former king's monument, or that industry of this kind is not required, or for some other reason, there is little in this department calling for attention. *A Design for an Art and Industrial Museum*, by C. CARACCILO, in pseudo-Greek style, has no marked feature. S. M. BIASINI has the *Façade of a Casino*, with belted columns and majolica frieze, hardly coming within the category of architectural structure. In the *Decoration for the principal Piazza of the Quarter of the Prati di Castello*, by V. MARTINUCCI, we have a long line of featureless building, with a central façade and depressed dome, the façade being fronted by an elevated terrace with steps. P. and S. ROSA submit a *Plan for a National Museum constructed on the Thermæ of Diocletian*. E. BASILE has a plan for a small palace, too bizarre and inharmonious to be satisfactory. V. MARIANI sends plans for a *National Gallery in Rome*, the interior of which recommends itself more than the exterior, but even here it is heavy and bald in its lower features. In the same room S. ROESLER-FRANZ exhibits a large series of views of the older parts of Rome, now fast perishing, interesting from both a pictorial and topographical point. Particularly noticeable are the views on the Tiber within the city, which are graphic and well chosen.

We may now turn to the sculpture, which constitutes one of the most important departments of the Exhibition: important, however, in regard to the number of works exhibited only, for it is with a feeling akin to dismay with which one enters upon an examination of them. The term sculpture in its traditional sense, as expressing the most severe and reticent of the arts for the representation of forms of ideal beauty in their abstract rather than concrete significance, is here utterly ignored or misunderstood. We are met by all possible forms of ugliness, triviality, and even the mimicry of disease. We have heads torn from the body, shoulders from which the arms appear to have been wrenched, figures divided in the most inappropriate manner, as if from the hands of a mediæval executioner. Then the subjects of by far the greater part of these works are silly and contemptible in the extreme, and sometimes disgusting. We have gaping mouths, winking eyes, mean and awkward movements everywhere. We have crying babies, full and modern-dressed little children, as from the fashion-card, with cats, parrots, dolls, and playthings: there are lace, veils, head-dresses, and trimmings—the sempstress and tailor are well represented—all sculptured in marble. Amongst this laughing, crying, gaping, kissing, leering crowd we have the head of an old man with a single tooth projecting from his mouth, his neck swollen with an enormous goitre, with the appetising title, *Thy Neighbour*. It must, however, in fairness be stated that this appears in terra-cotta and not in marble. In this inappropriateness of subject the proper value of the material and its suitability are entirely ignored. Although in bronze or in terra-cotta the levity and paltriness of some of these works are not so noticeable as when in marble, yet hardly in Dresden china or Sevres ware could many of them be tolerated. One wonders, perhaps, still more than at the perverted artistic sentiment which could produce these, to what kind of even vulgar and bad taste they can give pleasure, or in what houses they can be anything less than a horror and a scare. Fortunately not all belong to this forbidding category. There are good and noble works here, however few, and to the picking out of these we shall chiefly confine our attention.

Entering the rooms in the order of their numeration we find in Room B two marble slabs in low relief from the chisel of WALDO STORY (American), *Sacrificium* and *Bellerophon*, refined and tasteful in conception, but requiring more study and force in the modelling. (D) *The Daughter of the Sea*, by E. BRAGA, with one hand uplifted bearing a shell, and the other carrying a pearl, is easy and graceful. *The Waking of Aurora*, by A. MEGRET (French), a nude female figure in an upright position, accompanied by an amorino with a torch, is forcible in character and bold in modelling, and is well-felt throughout. *The Little Rogue*, by C. D'ASTANIERES (French), is well studied, easy, and natural, and must rank amongst the best works here. In Room E we have a well-modelled bust of the Pope, by A. GALLI. W. W. STORY (American) has a statue, *Canidia*, broad, severe, and dignified in treatment. *Saffo*, by A. BOTTINELLI, is a work deserving notice. *Venus arming Love*, by A. MACDONALD (English), is a pleasing subject, gracefully modelled and carefully worked. *Evening*, by A. WEIZENBERG, is a graceful figure, though a little heavy, of a sleepy-eyed nymph holding a poppy in one hand and a reversed torch in the other. R. GREENOUGH (American) has a reclining figure of *Circe offering the Cup to Ulysses*, which is well and gracefully conceived, though for the purposes of art the face might have borne a somewhat more refined expression. (F) In the *Eve*, by G. PECHAN (Austrian), we have a somewhat masculine figure, strongly rendered. She is shrinking in fear from the serpent. H. CARDWELL (English) has two works, *Christian Love*, exemplified in the Good Samaritan, and *Pagan Love*, Cupid subduing Pan. They are a little stiff and academic in style, but conscientiously studied, and sincere and thorough in treatment. *It is late yet he returns not*, by A. MASSARENTI, is an expectant female sitting on the shore. It is serious and impressive in its unaffected pathos. *A Caryatid*, by L. SCHILIZZI, for a sepulchral monument, is large in treatment and majestic in sentiment. The figure is wrapt in palm leaves, with the hands crossed on the bosom, and the face bearing an expression of earnest inspiration. G. KOPF (German) sends a *Group of Bathers*, rendered with spirit and verisimilitude. G. BIGGI has a statue of *Brutus* seated in a chair, stern, rugged, vigorous, and impressive. In the *Obstinate Impudence* of C. SIGHINOLFI, a girl taming a refractory dog, there is workmanship which would tell better on a less trivial subject. *An African Hunter*, by S. MORETTI, is noticeable for some ability

of modelling. (G) In the *Julius Cæsar* of E. XIMENES, we have the assassinated emperor lying dead on his back on the ground, with his head raised by an overturned chair. An expression of pain is on his face, and his hands and feet are convulsed by the last agonies. This work has been much noticed and talked of, but hardly strikes one as specially remarkable, beyond the originality of the subject and a power of treatment which removes it from the triviality and affectation of so much by which it is surrounded. *The Imploration*, by A. MARAINI, represents a young girl clinging to a column surmounted by a head (Hermes). She is gracefully and carefully modelled, and the whole conception is spirited and sculptural. It will well bear careful examination. Two bronzes in the next room by the same lady, *Eros* and *A Portrait*, both confirm her power in her art, and are specially noteworthy. L. ANSIGLIONI sends *Galatea*, a nymph reclining on the back of a dolphin, which is graceful and carefully executed, though with some tendency to the ornamental. Entering the room of bronzes, we are met by the fine life-size statue of E. FRANCESCHI, called *Fossor*. This is a really noble work, and one of the most impressive in the Exhibition. A man sits with his feet thrown across a slab, on which he is engraving rudely the symbol of martyrdom, a palm leaf, and the word "Martyr," in the style and manner of the inscriptions found in the catacombs surrounding Rome. The figure is youthful, of Roman type, serious and thoughtful, marked with the heavy experiences of his time. The work is large and sincere, and is altogether worthy of the highest praise. We find life and movement in the *Neapolitan Fisherman* of F. MORATILLA, though the casting is too smooth and monotonous. F. PEREDA's *Little African* is bright and intelligent-looking. *The Trasteverian* of A. LUZI is a woman's head, rendered with strong, coarse realism. E. BIONDI's *Caravan*, an oriental lady seated on a camel, has spirit and movement. *The Boatman*, by A. ALBERTI, representing a youth drawing a cord, is vigorous and natural. It has a rough piquancy by reason of its being untouched from the mould. *The Titania* of E. KEYSER (American), and the *Satyr with Love* of A. SOMMER, may be mentioned amongst noticeable works. E. FERRARI sends *The Battle of Palestro*, a relief from his monument to VICTOR EMANUEL in Venice. *A Boy playing Marbles on the Banks of the Tiber*, by A. LAURENTI, is faithful and lifelike. From J. WARRINGTON WOOD (English) we have *Oberon and Titania*, representing OBERON squeezing the juice of the flower upon the eyes of the sleeping TITANIA—not the least meritorious of this sculptor's works.

Entering the department of the Industrial Arts we are met in the first gallery by the furniture of S. NOCI. It consists of cabinets, escritaires, tables, and other articles. Some of these are of ebony inlaid with engraved ivory, mother of pearl, pietre dure, bronze, or majolica; there is an elaborate chimneypiece of walnut carved in high relief, but it wants unity and harmony in design. A finer and more artistic style of wood carving is shown in the works of S. SCALCO. He has a cupboard of extreme beauty, both in design and execution, artistic in treatment and in excellent taste. An elegant design is also shown in the carved cupboard upon a stand of F. BERTOLOTTI, the central panel of which represents VENUS carrying a winged amorino upon her shoulders. G. PIZZATI exhibits some gracefully designed cupboards and tables in oak and walnut. G. BOLLA has a bookcase upon a stand in wood mosaic (certosino), well designed and executed. The chimneypiece with a picture frame, of C. CAMBI, carved in walnut, is imposing, but it is somewhat heavy and cumbersome in the upper part. (Gal. II.) Mrs. A. FREEMAN (American) sends a chimneypiece and fender modelled with groups of dancing *putti*, which deserve to be translated into a more enduring material than that of plaster. A marble table, with a central picture in mosaic with inlaid sections of pebble, of the workmanship known as Borghesian, by A. VALEUZI, is a fine specimen of its kind. The ebony cabinet inlaid with ivory of G. PARRI, as well as the other works by the same hand, are highly decorated and very spirited. F. POGLIANI has also fine specimens of varied and rich inlay. The Industrial Artistic Establishment of Naples sends a good example of furniture in wood mosaic (cosmatesque). The capitals of the columns, however, depreciate its artistic effect, as they are out of character with the rest of the workmanship. In Gallery IV. is a fine bookcase carved in renaissance arabesque in a finished and elegant manner. Amongst the furniture of F. TOSO in the next gallery there are a number of figures, life size, carved in coloured woods in a realistic manner for hall decoration, than which it would be difficult to conceive anything more disagree-

able, or to imagine where and to whom they could give the slightest pleasure. One of these is a fiend with hoofs and horns in elaborate evening dress, holding out a plate for the reception of cards; another is a female to match, offering a ring. The vulgarity and hideousness might poison the taste and fine artistic feelings of a child for a lifetime, and shake the nerves of a sensitive person in any house in which they might be found. G. B. BATTISTA has a rich specimen of intarsia in ivory and ebony decorated with precious stones. A fine washstand in wood intaglio is by L. MASTRODONATO.

The majolica and earthenware department is well represented. In many parts of Italy there is an attempt to revive or keep up the traditions of the old manufacture with more or less success. The CASTELLANIS of Rome inaugurate a good school in this kind of ware and produce fine specimens. Other artists in various parts of Italy furnish praiseworthy testimony of their skill and devotion. In some places, it is true, the ceramic art has assumed its worst and most inappropriate form. The character of the material and its proper fitness has been ignored, and the most inappropriate forms and modes of decoration introduced. Heavy and cumbersome flowers, leaves, plants, figures, and other objects have been attached to every kind of article in full relief, without any regard to propriety or usefulness, and coloured in a manner not the least decorative. All this is vitiating, existing side by side with what is good and eligible. It is to be hoped that a more correct and better tutored taste will ultimately prevail, to the rejection of the tawdry and bizarre modes which have become too prevalent.

Beginning at the first room we have an intelligent representation of the old industry from Faenza, in the works of A. FARINA & SONS. They are not, however, all alike good. The same may be said of those of MINGHETTI & SONS, of Bologna.

(II.) In the works of G. CASTELLANI we have some excellent specimens. Those in the Persian and Moresco manners are very good. They are, however, a little overbalanced and patchy in parts, wanting that absolute ease and freedom which is the great charm of this kind of work. C. MILIANI has some very noticeable lustre wares, highly decorated and carefully worked. It would have been better if these had been executed upon an earthenware suggesting more quality and texture. It is too white, of the nature of porcelain, lacking tone. V. MOLARINI sends from Pesaro some good traditional work, both pictorial and ornamental.

(III.) From the same place we have seven majolica plates by T. BALDELLI, to which the objection may be made that the ware is too fine and smooth to show the style of decoration off to the best advantage. The same energetic little town sends some fine specimens of traditional workmanship from the hands of BERNARDUCCI and MAGRINI.

(IV.) T. CASTELLANI (brother of the last-mentioned of that name) has a case of fine and elaborate works, particularly a plate upon which are represented three angels kneeling amongst flowers. These are well worthy of careful examination. The objectionable school of ceramic ware already alluded to exists in Rome, Naples, and other cities of Italy. In the works of DE ROSSI BROTHERS we have flowers, fruit, and numerous other objects set upon plates, jugs, and other vessels without the least regard to suitability or propriety, showing that desire to adapt one kind of material to the purposes of another which always marks the absence of a correct art sentiment.

In Room VIII. this kind of perversity reigns triumphant in the works of CACCIAPUOTI BROTHERS and those of L. MARCETTI, which may be dismissed here with a word.

(VI.) The landscapes of A. PEDICONI are too absolutely pictorial and realistic to be adapted to the material he has chosen. G. BONCINELLI & SONS send some fine examples of Florentine mosaic; amongst others an elaborate table top, inlaid with flowers and strings of pearls in well selected marbles and precious stones.

In Rooms IX. and X. we have elaborate pictures in Roman mosaic, all inadequate and unsatisfactory. The only form in which mosaic can be properly adapted for pictorial representation is when it is used on a large scale, so that the eye at a right distance can fuse the parts into a whole. This seems entirely forgotten in the wasteful and laborious attempt to adapt mosaic to pictures of a smaller size.

(X.) G. MELILLO and L. CASALTA exhibit some fine specimens of Neapolitan coral carved and set with good taste.

(XIII.) A. PANDIANO sends some elaborate articles in

bronze and wrought iron. Particularly noticeable is a fine large candelabra. Other articles are noteworthy for their good taste and workmanship. A. PARQUALI has some good reproductions of Renaissance designs in metal. G. MICHELI & SONS show some excellent candelabra, with smaller objects, some of them chased, in iron, brass, and other metals.

(XIV.) Amongst the stuffs and furniture of LEVERA BROTHERS is a carved four-post bed furnished with silk appliqué on velvet, which is rich and elegant. The Venetian glass department is perhaps one of the most satisfactory and delightful of the whole Exhibition. It both retains the traditions of the old manufacture of the best period and introduces new elements in the same spirit of equal excellence. D. BENDON sends some charming articles of elaborate workmanship, large and small. The well-known manufactory of A. SALVIATI sends a great variety of articles, many of which are extremely lovely. Specially may be mentioned those in imitation of precious stones and ancient Roman glass. The Venetian Company of Murano also have much in no wise inferior. Indeed, it is hardly possible to overrate the taste and artistic skill displayed in these admirable specimens.

With these ends our inspection of an Exhibition which, whatever may be its shortcomings, contains quite enough to repay the search for what is artistic and beautiful.

EXHIBITION OF THE SCOTTISH ACADEMY.

WHETHER or not the present Edinburgh exhibition be better than any of its fifty-six predecessors, it is certain at least that it contains a fairly large number of landscapes of unusual merit, not a few excellent portraits, and several works of the imagination of a high order. Some of the Scottish painters appear to be equally at home in portraiture and in landscape, as, for example, Mr. GEORGE REID with his *Loch Skene* (168) and his various portraits, among which that of *Professor Tait* (234), as he stands before his blackboard in the attitude of explaining some profound formula, is seized and rendered with the same simplicity with which *Loch Skene* is presented to us. His *Portrait of Alexander Bain* (242) does not strike us as so successful, perhaps because of the unpleasant contrast between his scarlet robes and his nineteenth-century trousers. On the other hand, the head of *Sir W. Fettes Douglas* is excellent, though less finished than the face of Professor BAIN. Mr. REID has, however, produced a work of greater ambition than these, the *Last Sleep of Savonarola* (32), a large picture, simple and powerful in its conception, but wanting, as we think, in refinement in the rendering of the sombreness of the scene. Of the same name (GEORGE REID), but not an Academician, is the author of a most beautifully painted indoor picture called *In Days of Yore* (517); the colour is rich and harmonious, the conception simple and graphic. From Mr. McTAGGART's *Lobster-Fishers* (223) to his *Portrait of R. D. Orr, Esq.* (343), is a contrast; yet both are excellent. An extremely beautiful display of refined colour and skill of form is Mr. JAMES ARCHER's *Portrait of Miss Archer* (213). From this to the same artist's *Yellow Rose* (518), a portrait of a young child, is a change which we cannot approve of. Great, also, as is the merit of O'DONOVAN in his costume as a Turcoman chief, there is a studied arrangement of details which is too transparent. On the whole, the exhibition maintains a high standard of portraiture. Besides the larger and more finished examples which attract general attention we noticed with pleasure the portrait of a lady by ARCH. D. REID (733), and the *Portrait of G. Webster*, the sculptor, by J. LAWTON WINGATE (422). Nor must we forget the somewhat strained combination of portraiture and idealism in Mr. ALMA TADEMA's *Portrait of a Girl* (401). It is a very beautiful study, and testifies to the artist's skill. But it is hardly fair to the subject to treat her so much as a means of display of harmonised colour.

In figure subjects the President, Sir W. FETTES DOUGLAS, sends *Benevenuto Cellini displaying a finely-wrought Metal Dish to a probable Purchaser* (219). Possibly there is not too much made of the contrast between the artist, hardly concealing his contempt, and the dull buyer's unconsciousness of anyone being superior to himself, but the contrast is none the less unpleasant. *The Armourer* (331), by the same skilful hand, has more of the quietness and simplicity of a master. Sir W. FETTES DOUGLAS exhibits also three landscapes. Mr. ORCHARDSON, R.A., not unmindful of Edinburgh, sends a picture worthy of his high fame, *The Farmer's Daughter* (192). Her attitude

strikes at once the spectator as she stands outside a barn-door feeding pigeons, her left elbow thrown up for one of the gentle creatures to rest on; her right hand, still with some grain in it, strained instinctively downwards; the whole figure takes its pose from this throwing of the left arm to receive the kindly pigeon. Both arms are rendered with true power. But what shall we say of the simple beauty of her print skirt, drawn by the movement into a series of the most lovely folds? It is an example of how to idealise drapery. Everyone knows Mr. ORCHARDSON'S colouring. It is unnecessary here to say more than that it loses none of its charms; the reddish brown and white of the small crowd of pigeons harmonise perfectly with the dress of the farmer's daughter. Visitors to the exhibition owe him their gratitude. This they owe also to Sir FREDERICK LEIGHTON, those, at least, of them who had not before seen his *Phryne at Eleusis*, which, it may be remarked, is seen to better advantage in Edinburgh than in the London exhibition, being to a great extent isolated from the other pictures, and thus free from the more or less killing contiguity of works possessing nothing in common with it. The scale of the picture, the large, simple forms, and the colouring harmonise with the Edinburgh gallery. Nevertheless we are not yet persuaded to like the drapery on her right arm, especially the edge of it, which is made to adapt itself to the outline of her right breast more conveniently than drapery usually adapts itself. No less conveniently does the drapery fall from her waist behind, projecting just enough at each side to ease and lighten the task of drawing in the outlines of the legs. Among the others of greater fame who have not forgotten Edinburgh, Mr. MILLAIS shows, also in his *Caller Herrin'* (322) that he is far from forgetting the mastery of simple conception and simple execution which so honourably distinguishes him. It may be that the girl with her basket of herring is only *Cinderella* in a new scheme of colouring, a silvery blue being necessary for the sake of the herring, and it may be that the leafage and grass which set off her figure could not easily be found on the shore of the Forth so close to the sand. But, for all that, *Caller Herrin'* is full of charms of her own.

Mr. GIBB is a painter of figure subjects, and has evident skill. It may be that he has imagination also of a kind, but we do not appreciate it as we find it in his *Sea King* (329), and still less so in his more ambitious *Last Voyage* (96). Mr. JOHN FAED, another Scottish Academician, has abundance of imaginative force, but, like Sir NOEL PATON'S, it wants restraint. *The Poet's Dream* (16) is—apart from the fantastic idea of mountain rocks and mists, changed into an endless number of airy beings—a curious study, since these phantoms have a very decided taste for imitating well-known ancient statues. The scene is to some extent like a gigantic collection of sculptures, generally with strongly-marked anatomy, and including even the Achilles or Ajax of Hyde Park. We much prefer Mr. FAED when sketching in *The Fleet* (91). Still more we prefer Mr. JAMES FAED, jun., with his *Edge of the Forest* (84), or his *Among the Reeds, Monrieth Loch* (182). He likes a foreground of long grasses or bent, very sensitive to pressure, and often beaten down in patches. With these simple grasses carefully studied and executed in the foreground, he produces his first favourable impression. Thence we travel to a wider view, always characterised by a poetic feeling for nature. This, indeed, in varying degrees is the character of most of the landscapes in the exhibition. There is no grand conception of any one scene, but there is a most extraordinary amount of genuine poetic feeling for Nature, and if no commanding genius should ever arise out of this abundance of true talent, there will nevertheless be no reason to regret what has been done so far. Most of the landscape painters to whom we are here referring are known in the exhibitions at Burlington House; but there they appear only in isolated examples, while here they are not only more amply represented, but are, so to speak, more at home. Mr. JOHN SMART is a favourite landscape painter, and his *Last Rest of the Clansmen* (137) is a good picture, while his *Lochan Dhu, Loch Lubanaig* (330) would be more charming than it really is, and that is much, if there was a very little less of the pervading green spread over it. Mr. SMART sketches himself in his foreground and his distance, concentrating himself on the middle scene and giving it a very simple beauty. Mr. DAVID MURRAY spares no pains in his foregrounds. Less known, at least beyond Edinburgh, is the work of Mr. PATTI JACK, whose *Whins in Bloom* (236), and *Auirland, Wigtownshire* (722), both belong to a class of

landscapes fairly small in scale, but yet large enough to give scope for a very fine and sensitive brush.

The influence of the French Impressionists has not altogether passed over Scotland. To that school belong Mr. R. MCGREGOR'S *A Heavy Load* (338), Mr. JAMES IRVING'S *The Apple Harvest* (732), and Mr. J. FRASER TAYLOR'S *The Potato Harvest* (726). Possibly one or all of these three artists may do much better in this direction; but as yet they have hardly justified a departure from the national manner of treatment in the matter of landscape. Mr. MCGREGOR is true enough to the Scottish school in his interiors, as in (365) a small child trying to smoke a clay pipe, to the constrained amusement of an old man, much worn in body and dress; we should mention also his open air *Girl Reading* (282). Mr. GEORGE HAY is an able and accomplished painter of indoor effects, as, for example, in his *Dominie Sampson* (341), and *Caleb Balderstone's Ruse* (300). So, also, Mr. HOLE may be said to have succeeded well in his scene from "Henry IV.," when FALSTAFF boasts of his honours before the Prince (356). That is to say, the picture has been very successfully thought out and planned as to action, space, and colour; but much could have been done in finish and in giving more effect to the colouring, as has been done, for example, by Mr. GEORGE REID in his *Days of Yore*. Mr. THOMAS FAED has a true command of pathos, and it is therefore to be regretted that in such a picture as "*I cannot, Mother, I cannot!*" (349) he should not have endeavoured to dissociate the persons of the scene from a special class of eminent respectability. No doubt there is as much pathos among the eminently respectable as in other classes, but somehow such a picture carries with it far too special a sense of pain; it is almost as if we had a portrait of some particular young lady in these particularly unpleasant circumstances.

Among the less pretending pictures we may notice a bunch of larkspur (204) by Miss ELIZABETH GULLAND, shells (718) by Miss JANE MILLER, and chrysanthemums (114) by Miss ALICE GRAY, the last-mentioned being hung too high, as, indeed, are not a few small pictures of very unusual merit, while, on the contrary, a goodly number are well placed which would have been better outside the door. That seems to be inevitable in all exhibitions.

The section for sculpture is small and, as usual, has a comparatively large number of portrait busts of persons whom, without disrespect to the sister art, we should prefer to see on canvas. The painter has many aids which the sculptor can never command, and some of these subjects require a good deal of aid. Mr. CALDER MARSHALL, R.A., has sent a marble statue of *Cinderella*, which is very rightly placed in the centre of one of the rooms. He is a sculptor who never loses his simplicity and dignity of style. Mr. CLARK STANTON also is possessed of the true spirit of simplicity and largeness of form, as may be seen in his statue of *Pandora* (813) and his relief of *Twilight* (821). But in his draperies and hair, and partly also in his forms, he treats slightly and in a scratchy manner details which could and should be faithfully worked out. If the artist does not care to work them out, let him conceive his subject so as to do without them altogether. That is a very simple request. Mr. D. W. STEVENSON'S *Hero* (799) has lost her lower limbs under very bad drapery. His bronze statuette of *Echo* (801) would be a true and good work of sculpture but for the drapery. Mr. ALEXANDER RHIND sends a statuette in marble of the *Lady of the Lake* (820), a charmingly-conceived figure and well executed. Mr. W. BIRNIE RHIND, in his group to commemorate Tel-el-Kebir so far as the Highlanders were concerned, has seized a true artistic moment, and has shown a genuine love of form, notwithstanding the vast display of accoutrements which threaten to conceal all form. He will learn that these things, so necessary in training soldiers, are perhaps not so necessary after all when the final charge is made, and can at any rate be dispensed with in art to a great extent.

The Secretary of State for India is considering a memorial from the civil engineers employed in the Indian Public Works Department, claiming more fair and equitable treatment as compared with military officers engaged in the same service. The civil engineers claim equalisation of pay and retirement with their military colleagues, promotion proportionate to respective numbers, similar pensions, &c. The memorial also suggests that the council in London should include one civil engineer of Indian experience.

MODERN DESIGN.*

BY J. D. SEDDING.

(Continued from page 163.)

FIRST, then, our design is wholly eclectic, and I have just said that the root of this—yes, of most of its failings and failures—is the loss of tradition. This central defect brings in its train a multitude of inevitable evils; yet while recognising these evils as inevitable, it is clear that they may be aggravated or alleviated, according as they are met. This eclecticism—how is it manifested?—how is it to be met?—and what are its results? When an architect has to make a certain design he manages, by one of those strange strokes of nineteenth-century power not found out in old days, and not yet patented in these, to convert his mind into a magic-lantern. If the man be of methodic habits, he simply goes to a well-assorted bundle of slides that generally lie hard by his sketch-books; each slide representing a special phase of historic art. Having duly selected the period he will adopt, he slips his slide into his mind, colours it with a little of the light of his own fancy, and, *voilà*, the thing is done. This constant and seemingly inevitable resort to types of bygone days is bad, if for no other reason than as a proof of our lack of inspiration, and inspiration has accompanied the development of every phase of historic art, whatever its date in the world's history. This is a hapless state to be in, but who shall say our present straits have not been greatly aggravated by the narrow spirit which guided the early days of the Gothic revival? With something of the pride of our first parents after they had eaten of the tree of the knowledge of good and evil, these arch-rebels from authority and exiles from tradition, the Gothic revivalists, laid down hard and fast rules as to what was to be studied and what was to be religiously eschewed. It was demanded of us that we should look at, and imitate, only the rudimentary Mediæval art, and chronology, and not the law of human development, was to settle the question of the relative merit of God-inspired art. So many flaming swords were brandished about at the time, so many vials of wrath were held in the air, that everybody (except the impious few) fell on his knees at once and straightway worshipped what and how he was told, and a pretty bit of genuine nineteenth-century ritual it made. But human nature, which can stand a great deal, must have its way at last, and it came to pass that the theories that were gulped down with apparent relish in 1840, and the types of art then admired did not satisfy the minds of the people of 1850, and the theories and types worshipped in 1850 would not do for 1860, and those of 1860 would not do for 1870, and so it has gone on, and we have "succeeded in failing" in everything, and perchance the mind of 1890 will, with equal disdain, reject the types in vogue with us at the present day. And the long and the short of it is, we are suffering from dissipated eclecticism, and we are now arrived at that luckless state when even the power of selection and the faculty of concentration of thought seem to have left us, and all forms of art viewed with equal concern or unconcern as the case may be.

One of the most saddening, if not one of the most serious, results of this anarchy of taste is evidenced in the attitude towards old art of the younger architects of the present day. A few months ago and I was one of a select party of architectural students on a sketching excursion. The excursion was perfectly planned, admirably presided over. There was plenty of the oil of good companionship to make things run smooth. The choice of subjects was faultless, and yet, though everything was attractive all round, something was lacking. The choice of subject, I have said, was admirable both as to range and arrangement, for it included nearly every phase of every period of English architecture, from the "undoubted" Saxon of Brigstock to the most adorable declensions of the latest phases of Queen Anne. There was architecture ecclesiastical, episcopal, monastic, civic, domestic, baronial, cottage, manorial, scholastic; and yet—dare I say it?—the appetite to thoroughly enjoy so fascinating a bill of fare was wanting. You got a sense of nausea, of distaste, of the lack of appetite we usually associate with a pampered stomach and a gorged digestion. And will you believe me that, throughout the whole excursion, surrounded as we were by the very pick of grand old English work, the only things which seemed really to awaken the fire of the susceptible souls of the younger men into real rapture was some trumpy Jacobean pew-moulding or organ-gallery baluster; or some petty school exercise-book flourishes and signboard writing scabbled on an eighteenth-century memorial slab, or some heraldic devices and a detail or two (suitable for a Queen Anne fireplace) from an Elizabethan tomb or a curly-headed Georgian head-stone? Yes, to this day, though I have thought a great deal about it, I cannot make out that rage for memorials of the dead, unless it be that the Architectural Association has offered a prize for the best Queen Anne design for a monument to the Gothic revival now considered to be in the very last stage of a rapid decline. But why not let the dead bury their own dead?

Now, this strange lack of ardour in our younger architects, this absence of a generous abandonment to present delight and trust-

* A paper read at a meeting of the Architectural Association.

fulness as to the future, this prevision of coming evils unusual in youth, this want of sense of proportion and of power of estimating the relative value of things to be studied and drawn and loved, struck me greatly. I thought of my own green youth twenty years ago, when, like Gray's "little victims," one played regardless of one's doom. It made me feel how much was in the point of view. Here the youth of 1882 looks at every period (even those in vogue) as though it had a halter round its neck. Here was plenty of admiration, but of the serious, adult type; the young students had drunk of the same cup of bitter experience as their elders. They knew we had "succeeded in failing" in every period we had laid hands on, and even as they rushed at their scrabbled slabs and pew mouldings—

Still as they run, they look behind,
They hear a voice in every wind,
And snatch a fearful joy.

Alas! alas! we may never say of them as of the young students of 1860, "Where ignorance is bliss 'tis folly to be wise." These are not ignorant, they have no bliss, they have no sublime folly.

But to return to the eclecticism of modern design. See how our architecture suffers by it in detail and in style; and, although the former may be generally fairly correct, the style is almost invariably misrepresented. You know that (*pace* Mr. Gotch) it is not the dress that makes the man. His personality consists rather in his expression, in his build, his manner—his style, in fact. And so in architecture, the type of plan, the manner of grouping, the expression of the structure, as well as its actual features, go to make up the style, and the style is as essential to the rendering of a period as the details employed. But we have had so much to do to keep our heads above water during the torrent of changes of the last twenty years that only the strong swimmers have been able to carry away more than a superficial knowledge of the periods that have been run through; and, consequently, our imitations must be either exact copies or inexact imitations. The deficiencies in modern design of matters relating to style are very glaring; we may copy the details, but I say we almost invariably miss the essentials of style. Maybe we dress up our mediæval work in the proper mediæval tunic and beef-eater's hat, or our Queen Anne in the correctest breeches and buckles, and coat of a delicate ginger; but the jaunty air and self-conscious look and twinkle in the eye betray the period it is of. Of course we know that the Americans beat us on this point, as on most. The American architect is altogether a smarter fellow than the English. His Queen Anne has a sprucer dandyism than ours because he travels more. The shoe-buckles in his case are from Normandy, and the flowered waistcoat is of Franco-Anglo-Dutch extraction, worked on a ground of Italian satin (cotton back). His mediæval work is altogether ahead of ours in dash and daring, and it covers a wider chronological and geographical scope. He can combine circular dungeon keeps like the Tower of London (and equally awe-inspiring) with a dainty mansion dressed in half-timber work, like a Sussex or Normandy cottage, presumably representing a wall of 4½ inches thick, whose terraced ramparts and cross-bow slits, though they command only a cabbage garden, suggest to the imaginative mind of a susceptible Yankee a siege at any moment from real knights in real armour not made in Birmingham.

And now a word as to our attitude towards traditional art and our methods of acquiring and applying its types. It is plain to me that although the many are too inartistically inclined to study anything but photo-lithographs in the journals, the few who are doing their best to improve themselves and the art they practise are terribly tempted to make too much of old examples and to use them unwisely. If a nineteenth-century architect studies a style too exclusively he puts himself at the mercy of the old work, he thinks any variation wicked, and he ceases to be in harmony with the spirit of the present day because his heart is where his treasure is, in the past. We cannot fail to see that excessive resort to old example for every detail and every leading thought in design is bad. 1. We may get to rely exclusively upon the honey of the past (and hunger justifies any theft) and make no effort to coin food for ourselves out of the best tendencies and opportunities of the day in which we live. 2. We may get to imagine, with many excellent but moody-minded people, that the conditions which surrounded old art are part and parcel of its merit, and that these must be stereotyped in the nineteenth century ere we can hope to do good work. 3. We may have too many "excitants" for healthy design (and every idea is an "excitant" to the mind). 4. We may get to consider the stimulant as a necessary of life, and cease to nourish ourselves by the food of self-cultivation. 5. We may err by this radiation backwards by taking to copy things outright—a practice not at all unfrequently adopted, which will do neither ourselves nor our fellow-craftsman in the workshop of the nineteenth-century world an atom of good.

Of course, what applies in these remarks to contemporary architecture applies also to the allied branches of designs, such as furniture, stained glass, wall-papers, woven fabrics, metal-work, and the like. Now I do not think any decent publisher could be found to issue a bit of old poetry or old music, franked with a living man's name, and none other, although it was no more his composition than the man's in the moon! And if he did, the

transaction would be described by the world in fitting terms. Think how the world yet rates poor Chatterton's forged "Balade of Charitie," although, forsooth, it was the immortal boy's own production, and teemed with strokes of genuine poetry. Yet, as you know right well, in all branches of decorative design this sort of counterfeiting goes on, and manufacturers and designers do not blush for it, and the world does not characterise the transaction by the hard term of forgery, although in this case the things produced are real counterfeits that are foisted upon the public as genuine productions of the age that has rescued them from oblivion. It may be urged that where an old thing possesses real excellence, it were a pity everybody should not be able to enjoy it; or it may be said that as accuracy of presentment of a period aimed at is so excellent a thing in itself, such forgeries are free from blame because no living designer could touch it by original effort. This may all be very true, but do not let us point to such art as the nineteenth-century art, or as a token of progress. All is not fair in love, nor in war, nor in design. If you get your end by wrong means, it were better not attempted. All this sort of art reminds me of an embalmed corpse in a ball-dress. It is historic art made histrionic. It is like a scene in a theatre, where all the stage properties and dresses and wigs and pigtales are true to a hair, and you value the presentment as a piece of patient archæological research, yet are none the less glad to find when you get home that you are still in the century in whose workshop God gave you a bench.

What then should be our attitude to old art? This is really one of the great questions of the day. Let us look for a moment at the attitude of artists of old days, when they desired to get the influence out of antiquity, or to work in accordance with it. Every one knows how ardently the Italians loved Greek sculpture and Greek detail. But what they did was to study it so closely as to draw the nectar out of the old example, to cull its essence, to bring the spirit of the antique into contact with their own responsive spirits, and out of the impact to get fresh life and fervour. "Out of the strong came forth sweetness." As with the bees searching for secreted nectar, so with the student of historic art, the result not only supplies him with food personally, but the search is the means of fertilising the flower and of preserving the species. It is true we have no living art to fall back upon, as the Italian had, but we have one to make, and we have ourselves and the best imaginative tendencies and capacities of the age, joined to the lessons derivable from antiquity, wherewith to make it. Let us, then, be determined, however much the effort may add to the difficulties of our personal work, to be true to our own highest ideals and the highest ideals of our generation, and there will be hope for Victorian architecture. Nay, there are so many ways in which modern work may not only vie with, but beat, old work. Old art, not only individual, it is not always good, it is not always severe, it is not always interesting, for there were dull British architects in old days as in these; and we may not only cull all we can from antiquity, and impart the result to the structures we now rear, but we can imbue them with the more cultured individuality of an architect of the nineteenth century. We can grace them with more finish; we can plan with a more gifted sense of artistic planning; and we can put it into more thoughtful detail and more romance and poetry (and science too) than can be had in many a phase of historic art.

There is another point connected with this very idolatry of old art which I should like to say a word upon. From what one sees in the most recent developments of Victorian architecture, it appears to me that we are suffering from what I would call a penitent enthusiasm for the types that we had prejudged falsely. You know how twenty years ago "Christian architecture" was all the rage, and the term included only that which was not later than the thirteenth century. We were taught to cross ourselves at the sight of the Perpendicular; and, as for the Renaissance, even the most artistically elaborated vindictive of Mr. Ruskin could not fitly express one tithe of the loathing all pious-minded people should instinctively feel at the ungodly results of ungodly types of art. Broader views now happily obtain, yet the errors of past prejudice have left their stings behind them. Under the circumstances of the case it was inevitable that when once the spell of prejudice was broken, and the cast-iron barriers hurled down, it would be impossible to regulate, much more to check, the flood of admiration that would set in. And that is our present case; our admiration for the Renaissance enfolds in indiscriminating embrace all that had been so indiscriminately abused in the past, whatever its quality in the scales of good taste.

Now, I am not for a moment desirous to see another court of art-inquisition erected upon the ruins of the last—far from it. I love not to condemn the fruits of any well-meant service of mankind. Yet no one will say that the intrinsic value of all phases of art is the same. Vanbrugh's Renaissance is good of its kind, but the degree of its goodness can only be rightly measured by comparison with Bramante's, and I cannot see that because our sympathies have widened our power of comparison should by the same token have lessened. Liberty of range ought to be possible without necessarily meaning contamination of taste. Because the Gothic revivalists used the tarbrush so liberally over the Renaissance generally, that is no reason for our indiscriminate employment of whitewash. Let us bear in mind that as there is noble and ignoble Early English and Perpendicular, so there is

noble and ignoble Renaissance. We ought still to practise selection.

Seeing, then, what I do see in modern design—an entire absence of proportionate valuation of merit and of power to discern defect—seeing that the silliest, the most contemptible, the most glaringly bad features of historic art are copied by modern architects with the same innocent ardour and peculiar devotion as accompanying good features, I venture to characterise such violations of the true canons of good taste as mere licentiousness and Chinese tailorism. To sum up briefly, how we shall most profitably deal with an old example, let me say we should study it with loving sympathy—we should turn to it constantly for refreshment amid the heart-breaking failings of our own efforts—we should take it with thankfulness as the good grain from God's garner, laid by for our special needs (for none so needed the inspiration of old art before), as the good seed that, if put into the earth, and watered by our own endeavour, will grow and fructify as of old. To use its *motifs* is not wrong where we cannot get on without them. We should study it so that it should not only help the formation of our own taste, but lift our mind to a high level and hinder us from grovelling in routine. But do not let us borrow in order to compose a new design, but only use it to stimulate our ideas before they are expressed, and in order to get into relation with traditional methods of treating such subjects as we may have in hand. Do not let us, however, suppose that because we have hit upon an entirely new treatment that is still in accordance with artistic rules, that we are wrong—it is a blessed thing to be able to make breaches in the four walls of present circumstances. The system of design that never gets beyond the tether of the leading-strings of antiquity is not a living thing. The ancient example which, to my mind, is calculated to impart the most useful lessons to the modern architectural designer is that of Lot's wife. Remember Lot's wife!

The best corrective to all our improper leaning upon old art is, then, the fostering of individuality. And there never was a time more favourable to the exhibition of genuine individual character than the present. Let us note, moreover, with due satisfaction the evidences of this excellent trait in the work of many of our leading architects. In this emphasis of personal character lies, I verily believe, the brightest hope for modern art. Yet who is not aware of the vast amount of commonplaceness that stares you in the face as you walk the streets of London, or of any of our large manufacturing towns. London has been practically rebuilt during the last fifty years, and what have we to show for the unspeakably vast opportunities nineteenth-century architects have had placed in their hands. Goethe has called architecture "petrified music." Well, I hope we shall hear the music, in this case, some day! But at present I would ask you how many of these enormously costly edifices do you suppose will figure in history, except, perhaps, as the scene of a well-deserved bon-fire! Which of them gives you a spark of imaginative delight? Which creates in you a sense of that captivating and communicative thing—human interest? Which of them speaks of spontaneous inspiration—"fresh as wild roses"? Which of them has "quality"? Which suggests the divine origin of the gift of its design?

And why is our city architecture and much of our general design so very uninteresting? For this very reason that the designers are not interesting men. It has been said of life, that you find in life exactly what you put there; and so it is with architecture. If we were to put more thought, more poetry, more intensity of personal power into our work, if we crooned over it more, and let it be interpenetrated with our own character, it would add to our own personal interest in it; it would gain new charm and new power of appeal to our fellow-men, and would be a worthier offering to posterity. Our work may be never so faulty, yet, if the stamp of personal thought and of the mould of our own mind be there, it will cover a multitude of sins. Granted, moreover, that Victorian art is bound by the circumstances of our age to be a mongrel thing, this is only the more reason for the exercise of some controlling personal faculty to draw everything together and preserve the unities of art. And let none of us think to escape this necessity for doing true individual art by the plea of the smallness of the works it is our lot to do. If you think the matter over you will find that the very pick of the world's best productions are small things. How little Niccola of Pisa guessed that he was building himself an everlasting name, and earning a place among the immortals, when he made his pulpit! And even the smallest details of stone or wood or iron-work are capable of taking the very finest artistic expression. Nay, the things that seem to have the simplest range and the tiniest area for display are usually those which most tax a man's invention, and best represent his peculiar power.

The next point I would refer to is the limited range of our architectural design. No one expects, or ought to expect, to find work done nowadays that represents the highest summit of ideal art. We cannot forget that all art of the highest class—such as that of Greece in the days of Phidias, of France in the thirteenth century, of Italy in the fourteenth century, of England in the fifteenth century—comes only as the result of long preparation, as the *crème de la crème* of art that has stood a long time. How can our architects attain all at once to balanced qualities? And beyond the condition of the artists themselves, it also occurs to one to say that only a prepared public can appreciate really big

art. I have already descanted in my bravest tones of the extreme cleverness of modern design. Yes, gentlemen, the pity of it is that it is so clever; for that is just what the best historic art is not: it is inspired, but it is not clever. You know what Pascal says of eloquence:—"True eloquence," he says, "is that which laughs at eloquence." So, I would say, true design laughs at design. Look at any fine old building, with its calm front, its simple structure, its composed manner, its large effect and free spaces, and note how, if it be audacious here and there, it is placid as a whole; how, if it indulge in graceful refinements and delicate felicities, it does not rely on them, but upon accurate proportion, rhythm, and other simple or solid elements. Then turn to our Victorian designs. How much faddle there is about them, how inflated and self-conscious and concocted they look, how whimsical their air, with their garniture of superfluous and often spurious prettiness. And what I say on this head I say specially with regard to the Renaissance side of our design, and not so much of the Gothic. To speak truly, the present outburst of Renaissance design ought to have been preceded by strenuous study and a long vigil of preparation; had it been so, we should have a different tale to tell at this present moment. With the exception of such Renaissance as that of Mr. Norman Shaw (the man who, more than all the members of the Royal Institute of British Architects put together, enfranchised modern design, and who, perhaps for that reason, seems least eligible for the honours of the Institute)—I say, with the exception of the Renaissance of Mr. Shaw, Mr. Bodley, Mr. Philip Webb, and a few more—that is, of men whose sympathies and studies have set in this direction for full twenty years—you will find abundant testimony of complete unpreparedness in our designers in this class. Hence the failures of our Renaissance work; hence, too, the greater excellence of our Gothic work, because here we have had fifty years to prepare for its practice, and the Gothic designer is far too well charged with Mediæval ideas, and far too deeply read in Mediæval secrets to wish to spread himself out on a wall, and deploy before the eye of the astonished spectator all he knows, and all he could tell if he chose. Perchance, too, there may be something in the fact that the ranks of the Gothic school have been weeded of the half-hearted, half-taught adherents, and that only the chosen few of trained ability and tried spirit are left—the few whose quest has been crowned with spoils, too blest to relinquish their gains at the bidding of a fashion-mongering crowd. For one or both of these reasons, I am bold to say that the general run of our Gothic work is less forced, less spurious, less concocted, less inflated, less amusing—I had almost said in regard to the radiant imbecility of its applications of cribs from the past—than our Renaissance.

Lastly, may I crave your indulgence while I say, in the presence of young men, how much I, personally, deprecate the prevailing practice of calling upon young men to design. I never encourage a young man to design at all, and because I believe it to be against his own best interests and the interest and honour of art that he should trade on insufficient knowledge, or make a call upon a personality which is only in embryo. Why, he cannot render the great qualities of a great thing, even if he tries to copy it, any more than a thrumming schoolgirl can play a bit of Beethoven! What was the good of Mozart trying to compose at five years old? What is the good of a young architect spinning thoughts out of brains whose fibres are not equal to the strain of weaving? Let him rather, like the novice in a monastery, learn to keep silence—yea, even from good words. Let him, during a long novitiate, learn the real nobility of his high calling. Let him read his Ruskin; plod patiently on in the modelling class; let him learn the true principles of design; study the best principles; train his hand, his soul, his imagination; let him go to concerts, read poetry, prose, and romance, and combine with this all that he can possibly cram up of the history and composition of glue, of the newest electric light, the choicest method of laying drains and ventilating them with imperial self-acting exhaust ventilators, and know all about warming and acoustics and girders; let him draw and study flowers, foliage, animals, men, birds, trees, rocks, glaciers; let him seek to gather all that is "fair and fit" in all creation, but not design. I know my "Pope" too well to recommend that flattering folly,

A little learning is a dangerous thing, &c.

Having trespassed so long on your patience, I must draw my paper to a close. You may remember that I began with stating the position I should take in this paper. I undertook to look modern architectural design full in the face, and learn the worst about it without flinching, and to pick up such crumbs of comfort as came in our path. There is so much more, however, to be said before its present condition and its future prospects can be adequately told that I feel I must apologise for the little I am able to offer to-night. The line I have taken in discussing the perplexities of our work is to concede as much as one can to the modern world, and to the conditions of our age, while still claiming high ground for the pursuit of our vocation as artists; as, for instance, the inevitableness of our resort to ancient art of all possible kinds with the consequent certainty of reaping a harvest of mixed types and such like matters. Where you have a tangled skein and cannot unravel it in any other way, you break some of its threads and the

thing is easier at once. Modern design, as I am never weary of reiterating, is full of great faults and great qualities. There never were grander times for a man of mettle to be called to work in than the present, and just because the difficulties are so trying, the way so steep, the mists so dense about our feet and round about us. Yet there are moments when the watch-fires glimmer out in the heights above us, and we know that our labour is not in vain, and we press on. The great thing is that no one shall be indifferent to what is going on about us, and that every one should make a point of trying to crystallise the good tendencies of his design in the present day, and to amend its bad ones, and everyone can do something. Let us, moreover, try, each in our little way, to cultivate the virtues opposed to our present vices. To make of our changefulness of purpose, flexibility; to build chastened hopes on the ruins of our despair; to bring upon our gross licentiousness of taste the light of a more exact knowledge and clearer views; to let our love of faddling excessive ornament grow up into refinement and finish. And *finish* means not only to add refining touches, nor to make work as beautiful and simple and pure as may be, but it is to add something to it, by virtue of what, in Carlyle's language, "comes from under a man's hat," guided by the utmost knowledge and taste attainable from the highest imaginative tendencies of the day in which we live. Finally, my younger brethren, "Don't talk of what you are going to do. Do it!"

Discussion.

The CHAIRMAN said that the large attendance of members and the marked attention given to the lecture was perhaps the highest compliment they could have paid to Mr. Sedding. He thought Mr. Sedding had taken a somewhat gloomy view of the situation. For his own part he believed good work was being done, and that when time had clothed it with picturesqueness it would be said that good work had been done in the present age. In inviting a discussion the chairman recalled the advice given by the late president, Mr. Aston Webb, that the junior members should take their part in the discussions.

Mr. S. VACHER proposed a vote of thanks to Mr. Sedding for his paper. Mr. Sedding had remarked that they were too cosmopolitan in their studies, but it should be remembered that the question of pounds, shillings, and pence affected most of them. He thought, therefore, that the architect who adopted the profession to make money should have a liking for some particular style, and work up to that style. As students he thought they could not try their hands at sketching and designing too early. Seed was thus sown that would bear fruit later. Mr. Street had been in the habit of sketching everything he saw; so also had Mr. Burges. The architect, if unpractised in design, would be likely, when he got work to be carried into execution, to find his first attempt at design a failure.

Mr. ASTON WEBB being invited to speak, said he had come to listen and not to talk; but he would have great pleasure in seconding the vote of thanks to Mr. Sedding for his thoughtful, useful, and helpful paper. He agreed with the chairman in wishing that Mr. Sedding had been able to point to more that was good and hopeful in modern design; no one, however, ventured to think that he could suggest any royal road by which excellence could be attained. Looking at the merits, rather than the demerits of the present age, he agreed with the chairman that there was a great deal of architectural work, which, if they themselves did not live to be proud of, others would. After all, the architecture of the past they were all so proud of, was the good portion which remained out of much rubbish that had disappeared. The question of style had come up several times in the evening, and perhaps it was natural that it should, and it reminded him that he had seen in the professional papers that day, with some astonishment, that a discussion on Gothic style had taken place in one of the provincial architectural societies, and that a large majority had decided in favour of Gothic and its suitability for present wants. Mr. Sedding put down what was bad in the present day as arising from the want of a tradition; but it seemed to him (the speaker) that if they had a tradition at all it was certainly the Gothic tradition, and they should take up the Gothic revival where the old masters had left it. Mr. Webb then spoke of Mr. Street's building at the corner of Sloane Street, which was confronted on the opposite side of the street by some buildings in Jacobean style, or whatever they liked to call the style. In both there was style, and, as adapted to modern wants, each seemed to merge very closely into that of the other. Wakefield Town Hall was a good and a fine work, and one that would last. These, whatever style they belonged to, must be called nineteenth century in style.

Mr. J. A. GOTCH recommended the sketching of old work, not for reproduction's sake, however. It gave the student occasionally a good idea of what to avoid. He believed the present day was witnessing a return to what must be the foundation of everything in this world, namely, common sense. He thought great strides had been made in architecture in the last twenty years. At the beginning of the century common sense was derided, and buildings were put up in flagrant opposition to common sense. If in future any Victorian style was to be recognised as admirable, it would be found in the works of engineering, which were far more characteristic of the present day than anything else.

Mr. R. C. PAGE, vice-president, in supporting the vote of thanks, said he considered the present position of architecture was both discouraging and depressing. He thought it was a mistake for students to design.

Mr. MARTIN thought no harm would come if they made high principles their aim. If students did not begin to design when young, they ran the risk of becoming copyists, or at best, archaeologists. One great drawback, particularly in London, was the hurry in which work had to be done. Clients would allow no time, either for the planning, or the actual building of the work. Consequently the work was a sham. As an instance, in Wood Street, after the fire, what had been built on true principles was still standing, while all the sham work had been levelled with the ground.

Mr. FARROW said that eclecticism was no doubt a characteristic of the age, so that something might be said in favour of those who attempted to cull from past ages whatever they might find suited for their purpose. Mr. Vacher had rather harshly criticised the Natural History Museum at South Kensington, but the building was suited for its purpose.

Mr. VACHER: The gurgoyles?

Mr. FARROW said he was coming to speak of them later. No one who studied the plan of the building would fail to see that it was a modern plan, produced for the modern purpose of a museum which had no prototype in Mediaeval times. Terra-cotta, it had been thought, would withstand the London atmosphere better than stone, and the architect, having no previous work as a guide to its treatment, had struck boldly into a path which he thought would enable him to treat the material in an original and modern way. As to the gurgoyles, it had often been explained that they had a real use, and carried off the rain-water if by chance the gutters got choked, and thus prevented the risk of what might otherwise ruin the building. If any student had a liking or a gift for designing, he thought he could not help practising design; students could not keep from trying their hands if they had any inspiration at all.

The vote was passed by acclamation.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

A MONTHLY meeting of the Society of Antiquaries of Scotland was held in the Royal Institution, Edinburgh, on Monday, Dr. Arthur Mitchell, vice-president, in the chair. The first paper read was entitled "St. Ninian's Suburb and the Collegiate Church of the Holy Trinity, founded at Edinburgh by Queen Mary of Gueldres, the widow of James II., in 1462," by Daniel Wilson, LL.D., honorary member of the Society of Antiquaries of Scotland, Principal of University College, Toronto. After referring to the fact that thirty-five years had now elapsed since the demolition of this venerable structure, and that he alone survived of the band of antiquaries who assembled within its walls in 1848 to take part in the search for the remains of its royal foundress, Dr. Wilson went on to say that it seemed fitting that such a historical memorial of the fifteenth century should not be allowed to be swept away without some effort to preserve a definite record of its actual appearance and architectural details. The interesting building, which was the earliest specimen of the ecclesiastical architecture of the reign of James III., stood for some time before its demolition unencumbered by the buildings which had concealed it, and thus the author was enabled to make the careful sketches of its appearance and details which he now submitted to the Society. Dr. Wilson then called attention to the Hall of the Cordwainers, from which a sketch was exhibited of the arms and motto over the main entrance; the neighbouring structure, known as Dingwall Castle; the adjacent Leper Hospital, and the supposed Roman road, which traversed the quarter. The progress of the building of the church was traced in the Exchequer accounts and from other sources. The building was then described in detail, with references to a series of beautiful drawings by Dr. Wilson, and a ground plan made before its demolition by Mr. Kerr, F.S.A., Scot. M. George Seton, Mr. Kerr (architect), and Dr. Arthur Mitchell referred in complimentary terms to the drawings which Dr. Wilson had sent to illustrate his paper, and also to the well-remembered zeal and energy of Dr. Wilson himself as secretary of the Society. In the second paper the Rev. R. R. Lingard Guthrie contributed a very interesting notice of the graves of the regicides at Vevay, in Switzerland, with copies of the inscriptions, some of which have not been visible for a century at least, but which he had the opportunity of copying while some repairs were being executed on the church in autumn last. The third paper was a notice of an ancient portrait on panel, formerly in Stirling Castle, by Mr. Charles Elphinstone Dalrymple, F.S.A., Scot. The picture, which is now the property of Mr. C. E. Dalrymple, was exhibited to the meeting. It is on an oak panel, 15½ inches by 19 inches, and represents a man in the costume and armour of the second half of the sixteenth century. It has been considered to be of the school of Clouet, the French portrait painter of that period, but the character of the countenance is Scotch, and the original may have been one of the many Scots who frequented France in that age. The fourth paper was a description by Dr. John Alexander Smith,

secretary, of a considerable collection of stone implements and other objects, chiefly of what has been called a neo-archaic character, from Shetland and Fair Isle, which had recently been presented to the museum by Mr. John Bruce, jun., of Sumburgh, and others. The casts of the Kildalton Cross and of six other sculptured stones in Islay, which were sometime ago sent to the museum by Mrs. Ramsay, of Kildalton, were described by Dr. Arthur Mitchell from notes supplied by Mrs. Ramsay, and the special thanks of the Society were awarded to her for this interesting and important donation.

THE ITALIAN LAW OF COPYRIGHT.

IN Italy authors have the exclusive right of publishing, reproducing, and selling the reproductions of their works. The following come under the same regulation:—The printing or other publication of lectures, speeches, and public discourses taken down in shorthand or otherwise; works or compositions adapted for public representations, and the execution of all kinds of choral or musical compositions, both published and unpublished; the execution of works of art made from the author's sketches. Political and similar speeches made in public, and especially in Parliament, may be freely reproduced and published in the accounts of the sitting and in the newspapers, but not in the form of a special publication of one or more of the speeches of an individual, nor as a portion of the collection of his works. The reproduction of the following is reserved to the authors:—Extracts and adaptations of musical works, or portions thereof, for several instruments, excepting when the motive of an original work is taken as the theme of a musical composition forming a new work; the variation of a drawing, painting, statue, or other similar work of art by alteration of the material, form, style, or size of the original. Authors have the right to forbid the sale within the kingdom of reproductions of their works made abroad without their consent. When the copyright belongs in common to several persons, each one is considered to own an equal share of it in the absence of proof to the contrary, and may exercise the entire right thereof, whilst his partners may claim from him their respective shares of the advantages appertaining thereto. In case of the transfer of copyright, the new owner is bound by this rule, if notice has been given to him of the rights of the other partners.

Copyright dates from the first publication of a work, and holds good for the life of the author and during forty years after his death, or during eighty years. Fresh editions, however modified or augmented, do not constitute a new work. The copyright of such additions and modifications terminates with that of the original work. The exclusive copyright remains with the author during his lifetime. If he die before forty years have elapsed since the first publication of his work, the right passes to his heirs or assigns until the termination of the said period, at which time a second term of forty years commences, during which the work may be reproduced and sold by others on payment of a royalty of 5 per cent. on the price set on each copy.

The right of making or authorising translations lasts for twelve years. This rule is applicable likewise to drawings, pictures, sculpture, &c., as regards the reproduction of forms and figures by labour which is not merely mechanical or chemical, but consists in work belonging to some other branch of art—e.g. the engraving of a picture, the drawing of a statue, and the like. Author's rights apply to translations of literary and scientific works, as well as to those of works of art. The period of copyright commences from the year in which the last part of the work is published; but when several volumes are issued the periods for each volume are counted separately as they appear. Fractions of a year are not computed.

Whosoever desires to enjoy the rights guaranteed by this law must present to the printer of the province at least three copies, photographs, or other objects sufficient to assure the identity of his work, together with a declaration precisely specifying the work and the year of its issue, exhibition, or publication, and expressing his desire to reserve the rights which belong to him as author or editor.

The requisite declaration and presentation must be made within three months from the date of publication, representation, &c. Later declarations are also effectual, excepting as regards the period which has elapsed since the expiration of the three months. If, during that time, the sale of his works has been commenced by others, the author cannot stop it for such number of copies as have been printed or ordered abroad, and in cases of dispute upon this point the legal authorities will decide the case. In the absence of declaration and deposit during ten years from the date of publication the authors' rights expire altogether. Notice of all declarations of copyright will be given monthly by the Government in the Official Gazette.

The penalty for breach of copyright is a fine of not more than 200*l.*, besides the payment of damages and interest, and such additional penalties as may be inflicted in case of theft and fraud under the provisions of the Penal Code. Prosecutions for

the protection of author's rights under the present law will be undertaken by Government ("d'ufficio"). The counterfeit works and the materials used in their production, when they cannot be used for producing other works than the counterfeit ones, will be destroyed, unless the injured party desires their adjudication to himself at a fixed valuation on account of damages and interest, or the defendant requests their sequestration until the copyright shall have expired. The Court will always receive the latter application, and give preference to it over that of the plaintiff. The adjudication to the plaintiff shall be at the value fixed by him, if not disputed by the defendant; otherwise the value shall be settled by arbitration, and officially pronounced by the judge, the plaintiff being free to accept this new valuation or to withdraw his demand. In the course of the last year of the copyright the destruction, as above mentioned, cannot be ordered, and if it has been previously ordained, it may be stayed on the application of the defendant. In lieu of destruction the articles shall be sequestered at the expense of the defendant until the expiration of the copyright. At any period of the duration of copyright the judge may, if the parties do not protest, order the counterfeit works and materials for their production to be placed in a public museum, if they are valuable as works of art. When the plaintiff's right is one of a royalty only, neither destruction nor sequestration can be ordered, excepting sequestration to insure payment of the royalty. When the amount of the royalty is not clearly ascertained, it may be fixed by experts on the Judge's order.

The present law applies to authors of works published in foreign countries with which there are no existing special treaties, and which have laws for the protection of copyright, and accord reciprocity to the kingdom of Italy in this respect. Reciprocity of the application of copyright laws may be granted by the Italian Government to foreign countries by Royal decree, provided that their law is not substantially different from this law. Declaration or deposit of copyright according to the law of the foreign country will suffice to secure the author's rights in Italy. If the law of the foreign country does not prescribe declaration or deposit, they can be effected in Italy or at the Italian Consulates abroad.

The conservation of deposits and declarations will be provided for by Royal decree, and provision made for the payment of fees to the amount of not more than 10 lire, together with all further requirements for the carrying out of this law. The present law is applicable to works already published.

THE INSTITUTE PRIZES.

THE medals and other prizes offered by the Royal Institute of British Architects for 1882–83 have been awarded. In consequence of the inferior character of the designs and drawings submitted this year, the Council have decided to withhold the Tite Prize, but an honorarium of 10*l.* will be paid to each of the following competitors, viz., John Wallace, 144 Bath Street, Glasgow; Hubert A. Gregg, Hadley Common, Barnet; and Harry A. Paley, 8 George Street, Manchester Square, W. The Grissell Gold Medal has been awarded to Harry A. Paley. The Soane Medallion and 50*l.* have been awarded to Robert A. Briggs, A.R.I.B.A., 76 Wellington Buildings, Chelsea. Medals of Merit have been also awarded to F. R. L. Edwards, 30 Robert Street, Chorlton-on-Medlock, Manchester, and E. J. Milner-Allen, A.R.I.B.A., High Bank, Fulham. The Institute Medal and ten guineas (drawings) have been awarded to James Strong, 6 Abbey Square, Chester. A Medal and five guineas have been awarded to W. H. Bidlake, B.A., 11 Alma Road, Canonbury, N. A certificate and three guineas to A. Hemingway, 37 Hanover Gardens, Kennington, S.E., and a certificate to Harry Sirt, 2 Hardwick Place, Harrington Square, N.W. The Institute Medal and ten guineas were awarded to Harry Sirt for an essay on English Hall-work, Canopies, and Rood Screens of the Fifteenth Century.

The subjects adopted for the medals and prizes for 1883–84 are as follows: *Soane Medallion*. A Theological College for thirty students, with dining-hall, library, students' common-room, chapel, lecture-room and class-room, dormitories, private studies, household offices, and principal's residence. Area of ground not to exceed 250 feet by 150 feet. *Tite Prize*. Entrance Hall and Staircase of a Royal Palace. The staircase to be placed immediately beyond and opposite the entrance hall, or separated from it only by a corridor. On the first floor over the entrance hall must be provided an ante-room or vestibule to the principal reception-rooms right and left. The height from ground to first floor is to be 22 feet from floor to floor. The height of the upper floor is not fixed, but the ante-room or vestibule should not be less than 30 feet high. The staircase hall to be lighted from above by a dome or otherwise. *Grissell Medal*. Central Hall of a Fruit and Vegetable Market, to be of iron construction, properly lighted and ventilated. The design must include a central lantern. Height of hall to top of lantern not to exceed 100 feet. *Institute Medal and Ten Guineas (Drawings)*. A Town or Country House (including half-timbered houses), or some abbey, cathedral, &c. The subject for the Essay is "Staircases."

NOTES AND COMMENTS.

A CONVERSAZIONE is to be held in the Chapter-house of Gloucester Cathedral on the 29th inst., in connection with the recently formed "Cathedral Society." Architectural or other drawings of the Cathedral or portions of it, more particularly having special reference to its past history, will be gladly accepted by the executive committee for exhibition; also any objects of interest, other than drawings, having direct or indirect connection with the Cathedral or its history. Every care will be taken of all exhibits, and they will be duly returned at the close of the exhibition, which will probably remain open a day or two after the conversazione. All loans for exhibition may be consigned to the care of the Hon. and Rev. Canon LYTTELTON, College Court, Gloucester.

THERE is always much grumbling whenever it is found that the cost of a building exceeds the architect's estimate, and especially when the buildings are for the Government or local authorities. But architecture cannot compare with engineering in respect to financial surprises. The statement which was made in the House of Commons on Tuesday about the cost of harbours, shows how much unexpected contingencies may amount to in works of construction. Dover Harbour was estimated to cost 245,000*l.*; the works are not complete, yet the expenditure has been 693,000*l.* The estimate for Alderney was 620,000*l.*, but double that sum has been laid out, and, as the harbour is useless, the 1,274,000*l.* might with as much advantage have been thrown into the sea. It would seem that a harbour worthy of the name is not to be constructed for less than a million. Holyhead Harbour cost 1,479,000*l.*, although the original estimate was 638,000*l.*; and already on the Portsmouth Harbour a sum of 1,034,000*l.* has been expended, the estimate being 558,000*l.* The four harbours have thus taken 4,500,000*l.* instead of 2,059,000*l.*, which was the amount of the engineers' estimates.

MUCH service would be rendered to the profession if an architect would take an action for libel whenever a tradesman charges architects with dishonesty. There is an opportunity at the present time. *Apropos* of Mr. MORRIS'S lecture on "Art and Wealth" at Manchester, a man named AXON, who, it appears, is a painter, and has been employed by architects, has had the effrontery to write to a Manchester paper asserting that architects are bribed to pass bad work, and that it needs only the expenditure of a few pounds to get an architect to certify anything. The Manchester Society of Architects have repudiated the assertion, saying that any such conduct on the part of an architect, if reasonably proved, would result in his name being crossed off the lists of the Institute or local societies. But with people of Mr. AXON'S class polite letter-writing is useless. He must refer to the architects of his district, and, unless we are mistaken, it would be possible for any one architect to interpret his statements as having a personal reference. It is only in the witness-box of a public court that the allegations of illicit commissions can be properly refuted.

THE report of the City and Guilds of London Institute for the Advancement of Technical Education is a satisfactory document. The Institute has already done good work, and the arrangements for the future are inspired by good sense. It will be the fault of the working-men and apprentices if they do not take advantage of the opportunity which is now offered of gaining theoretical and practical instruction. The course for the Building Trades will suggest the character of the school. There are first, second, and third years' courses for carpentry, and joining, and bricklaying. On Monday the students are taught mathematics and physics, with practical instruction in the laboratory. On Tuesday, they have drawing, chemistry, mechanics, and German. On Wednesday, mathematics, mechanics, chemistry, and French. On Thursday, mechanics, drawing, physics, modelling, and German. On Friday, mathematics, mechanics, chemistry, and workshop practice. On Saturday, drawing. In the evening classes there are besides lectures on chemistry, drawing, &c., practical courses on bricklaying, carpentry, and furniture. The titles of the lectures are good, and the professors and teachers are all experts.

ONE of the most satisfactory parts of the report is that which relates to provincial schools. The Council have promised grants on condition that a sufficient sum of money is subscribed from local sources for the erection and maintenance

of an efficient school, and that the programme of instruction is satisfactory. The Drapers' Company have, at the instance of the Council, agreed to subscribe 500*l.* a year towards the establishment of a school of mechanical engineering for artisans at Nottingham. Some of the local manufacturers have also liberally subscribed towards the school. Arrangements are in progress for forming a special technical school in Manchester. A similar school is to be founded in Leicester, to which the Institute have promised 3,500*l.* Aid has been also offered to promoters of a metallurgical school in Middlesbrough, and a technical school for the weavers and flax-spinners of Belfast. The Council would be able to do much more towards the advancement of technical education in the provinces if the subscription list represented a larger sum. The expenses at present are not more than 10,000*l.* a year.

SOME time ago Mr. WATTS painted a portrait of the PRINCE OF WALES for the Temple. But the work was not admired by the critics and many of the public, and the artist with characteristic pride returned the cheque for 1,000*l.*, which was the price of the portrait. A substitute is required, and the commission has been entrusted to Mr. FRANK HOLL. But the difficulty now is to obtain sittings from His Royal Highness. Although a Benchler, the PRINCE OF WALES is at present unable to find time to meet the artist. It is not surprising that many of the Templars are somewhat dissatisfied when they read that Herr ANGELO has been fortunate in obtaining two days from the Prince. But in good time Mr. HOLL and the Benchlers will have the desired opportunity.

THERE is no English artist whose works secure a higher price at CHRISTIE'S than Mr. LONG, R.A., and in consequence shrewd cotton merchants in Lancashire are always willing to invest in one of his works. The chief competitor of Mr. HOLLOWAY, who carried off the *Babylonian Marriage Market*, has just purchased the largest work Mr. LONG has yet painted, for 6,000*l.*, and when it is remembered that it is 16 feet in length, the sum is not excessive.

AN association, called "The Institute of Industrial Art, British Burma," has been formed at Rangoon with the approval and support of the local Government. The Institute consists of a committee of direction, and of a guild or guilds of workmen, or of individual producers of industrial art-objects. The art-furniture business of the Rangoon and Moulmein jails has been taken over by the committee, who will endeavour to graft on this the higher art industries of wood-carving existing in Henzada and elsewhere in Burma, placing the whole on a co-operative basis, where the workmen will be paid, in the first place, the net cost of the work produced, and afterwards at regular intervals—quarterly, half-yearly, or yearly—as shall be most expedient. The profits proceeding from the sale of the articles are to be divided, so that four-fifths shall be distributed to the workmen, and one-fifth shall remain at the disposal of the committee of direction. To this one-fifth the local Government of British Burma will add an equal amount guaranteed for five years, and the sum thus obtained is to be devoted to the furtherance of art purposes. In addition to wood-carving, gold and silver work, tin, copper, and brass work, ivory-carving, gilding, colour decoration, embroidery, &c., will hereafter be undertaken.

AN important case has just been decided in the Scottish Courts which throws light on the position of a clerk of works. In 1877 a firm of contractors, [redacted] to erect a bridge in Ayr for the sum of 13,000*l.*, and the work was completed in 1879. The bridge was found to be defective, and in consequence the Road Trustees were put to expense. They entered an action against the contractors and the engineers who designed and superintended the construction of the bridge. The contractors pleaded that the bridge was according to the plans and specifications, while the engineers averred that they performed the whole duties incumbent upon them, and they denied that the bridge was in any way defectively constructed or insufficiently tested. The damages claimed amounted to 8,750*l.* The judge exonerated the engineers on all points, and the contractors for all but the remedial works at one of the piers. It was alleged that the defects would not have occurred if the clerk of works did his duty. He was appointed by the engineers, and was under their orders. But as he was paid by the Trustees, the Court held that he was their servant, and it was the interest of the Trustees to see that the persons with whom they had contracted duly fulfilled their contract.

ILLUSTRATION.

ST. STEPHEN LED TO EXECUTION.

THERE are many difficulties which impede the introduction of mural paintings in English churches, and in consequence very few English artists have been allowed an opportunity of undertaking work which is not only of the highest class, but which would have a beneficial influence on their ordinary work. Mr. ARMITAGE, R.A., at his own cost painted the chapels of a Roman Catholic Church at Islington, but the experiment, although successful, has been rarely repeated. The President of the Royal Academy painted a noble work in Lyndhurst Church, but even his great influence has been unavailing, and although churches have been decorated, there are not a dozen in all England in which a painting by an artist of position is to be found.

The fresco by Mr. POYNTER, R.A., which adorns the Church of St. Stephen, Dulwich, is therefore of interest, not only from its vigour and the mastery of the human form which it displays, but from its novelty as being a mural picture in a modern church. Owing probably to legal difficulties it does not occupy the position which the work would have as a matter of course in a continental or a Roman Catholic Church. It is not above the altar, as it should be, but fills a recess on the right side of the chancel. The church being Gothic in style (it was designed by Mr. C. BARRY) the recess has a pointed arch, and the upper part of the wall space is filled with a fresco picture of St. STEPHEN before the Council, which is admirably adapted to the position. Beneath is the scene which we illustrate. It represents the moment when St. STEPHEN, being led to the stoning, sees the heavens open. The rage of the Hebrew fanatics is contrasted with the enthusiasm of the martyr and the discipline of the Roman soldiers. On the left is St. PAUL, holding the garments, and it will be seen that the artist suggests that the saint's part in the tragedy was not undertaken willingly. It is supposed that fresco-painting is not adapted to an English climate, and the early experiments in the Houses of Parliament are often pointed out to show the failure of fresco. But much experience has been gained since those works were produced, and at present there are no signs of deterioration in Mr. POYNTER's painting at Dulwich. It may be added that the fresco was painted at the cost of Mr. PALMER, a gentleman to whom the parish of St. Stephen is indebted for many acts of liberality.

KIRKSTALL ABBEY.*

BY J. WREGHITT CONNOR, F.R.I.B.A.

(Continued from page 162.)

THE next room was one of great importance, being the monks' day-room. This was a fine vaulted apartment with a row of round columns down the centre, and lighted by a range of openings along the east side. The general appearance would be similar to the view of the lay brothers' day-room at Furness Abbey, as restored by Mr. Sharpe, the principal difference being that the columns were not clustered, and that at the sides the groining ribs sprang from corbels, and not from attached shafts. The perspective of this apartment must have been very effective, and it is much to be regretted that for want of a little forethought it has been allowed to fall into complete ruin.

At the end of the monks' day-room were three small barrel-vaulted apartments of considerable height, the uses of which are uncertain. The main drain of the abbey runs through one of them, which doubtless formed the monks' necessaria. The other two were probably only store-rooms. It is of course wholly needless to find uses for every small area in the monastic buildings. A great establishment could employ any small rooms about the place for a variety of purposes, and many of these were, doubtless, devoted to no special use other than occasion might dictate.

The church and the other parts of the building which I have described formed the north and east sides of the cloister garth. Changing our direction, we find the first structure on the south side to have been the kitchen. This was a vaulted apartment, having two columns in the centre. It was entered from the cloister and, no doubt, had a door into the kitchen court to the south of it. It is now, however, in such absolute ruin that we can determine little more than its position, nor can even the size and place of the oven and cooking arrangements be fixed. About the end of the fifteenth, or beginning of the sixteenth, century, a new kitchen was built much further south, and the old one would

appear to have been thrown into the refectory. This part of the Abbey was rebuilt on the old foundations at the same time, but was so much altered that it is now impossible to tell the character of the original structure. The new one was made two storeys in height, whilst the first was, I think, but one, with an open timbered roof. The additional storey was, probably, required in order to increase the area of the monks' dormitory, which might then have been found too limited in size for the increased numbers it had to accommodate.

The refectory was entered from the south cloister, each monk receiving his rations from a turn-table which stood in an opening between the refectory and the adjoining buttery. These were consumed in silence on the part of the monks, but were accompanied by the reading of passages of Scripture by a member of the community, who occupied a desk, of which no trace is left, but which usually was placed in the centre of the west wall. The refectory and the domestic offices in Cistercian abbeys were always placed next to the cloister, because the cooking was done by the monks themselves, and these portions of the building thus became a part of the abbey devoted to those who had taken the vow.

The buttery was a groined apartment, with two columns in the centre. It appears to have been cellared under, but it is doubtful if any storey was built over it. By a curious conceit the wall to the south was divided into bays by pilasters carrying arches, but the window in each, instead of being in the centre as one might have expected, is pierced quite to one side of each compartment.

Between the cloister and the large building on the west side ran a wide passage, which seems to have served to give the monks' quarters the seclusion required by the rigid rules of the Order, and to enable the guests and lay brethren to reach the church from the south. There is reason to believe that only half of this passage, longitudinally, was roofed in; the other half, throughout its length, being left open for light and air. The area at the south end next to the buttery and forming the entrance was, however, covered entirely, each end being spanned by a fine Norman archway of quite exceptional beauty, both of which still stand. The existence of a fireplace and oven in this portico would seem to imply that this part of the building served as a kitchen for the lay brethren; and this is confirmed by the fact of there being no other building answering to the description. Strange to say, antiquarians have always failed to remember that some provision must have existed for the cooking operations of the lay brethren; for it is scarcely to be imagined that the monks would condescend to cook for their inferiors in their own kitchen. The idea of this covered archway being the place where the cooking for the lay brethren was done is confirmed by the existence of an opening into the Abbey drain close by here, apparently for the purpose of depositing kitchen refuse to be carried by the stream into the river.

Parallel with the passage I have spoken of ran the lay brethren's day-room. Over no part of the Cistercian plan has fiercer controversy raged than over this. It has been held to have been the Abbey storehouse by many antiquarians; but, in my humble opinion, the late Mr. Edmund Sharpe maintained incontrovertibly his position that it formed the domus conversorum, or lay brothers' common room. Though larger than the monks' day-room, as a consequence of the greater number of inmates, its general style was almost a counterpart of it, which in some degree confirms the idea of a similarity of purpose.

The building at right angles, or nearly so, to the south end of this room was, probably, partly workshop, partly, from the position of the drain, the necessaria of the lay brothers.

The central area formed by the various buildings named was, undoubtedly, surrounded by a covered walk. As no remains of this are now left, it was probably of wood, and has perished by lapse of time, or has been removed by persons in need of a little cheap material. Judicious excavation would very likely determine the width and character of this by exposing the foundations, as well as settle other doubtful points. It is to be regretted that no opportunity has yet been afforded of doing a little of this kind of exploration under skilled direction.

On the south side of the walk were the lavatories. The originals do not exist, but fragments of a fine range of Early English ones are still to be seen.

It is difficult to determine the number and purpose of the rooms on the first floor, as a result of their ruined condition. We may say with certainty that those above the day-rooms were the dormitories of the monks and lay brethren respectively. The apartments to the west and immediately adjoining these might have been the infirmaries, which are known to have existed, and of which we have no trace elsewhere. Mr. Sharpe held that at the north end of monks' dormitory, in the position I have marked, was the scriptorium, a room in which the manuscripts were prepared and preserved. Whether this was so or not is doubtful, but it is evident, from a comparison with the size of the lay brethren's dormitory, that it was unlikely the monks would occupy the whole of the first floor over their range of buildings as a sleeping apartment.

From the dormitory level a staircase led to the south transept of church, so that the monks might attend and return from matins without exposing themselves unnecessarily. This was a very desirable precaution, seeing that they had a service in the church

* From a paper read before the Leeds Architectural Society. (See Illustration in last Number.)

at two o'clock in the morning, rising from and returning to their beds before and after it.

The staircase shown as leading to the lay brethren's dormitory has no authority in the ruins for the position it occupies on the plan, but it is the one at which it was usually placed. It has generally been held that the circular staircase at the west end of church afforded the inmates of the lay brethren's dormitory the same facilities for reaching the church that the monks had. This I do not think was so. There is no evidence, or very slight evidence, of there having been a doorway between the dormitory and this staircase, neither did the same necessity exist for it; the lay brethren did not attend matins, and as prime song—the next service—was at six o'clock, the brethren would be prepared for their daily work, and would not need the shelter required by those who came to matins.

At the time of its erection the buildings I have mentioned comprised the whole of the Abbey proper. Of other works there was the first gatehouse, part of which still stands across Vesper Lane, and where it is supposed the original Abbey mill was placed. Half-way between this and the Abbey was another gatehouse; though whether its position marks that of an inner wall or not is uncertain. The archway and angle stairs of this remains in good preservation, and form part of Abbey House, the residence of Major Butler. Besides these there would be a host of other buildings, stables, sheds, granaries, and so forth. No trace whatever is left of any of them, and it is possible that they never passed the timber age, and have consequently utterly perished.

The precincts of the Abbey were enclosed by a wall, which can still be traced here and there, but of which the height and character cannot be determined.

The stream for the working of the Abbey mill ran from Horsforth, and is now turned into the Aire at Kirkstall Forge. In the twelfth century it continued on to a mill pond, near the Vesper Gate, the overflow from this being carried under the Abbey buildings, as shown, serving as the main drain, and thence into the river.

Between the buildings and the river were the fish-ponds. Of these there were two, though probably only one was constructed at the time of the Abbey's erection.

The comparative poverty of the monastery prevented the wholesale rebuilding common to most structures of the Middle Ages; and, with the exception of the changes I have spoken of, the whole of the original buildings remained in the form in which they were built.

The relaxation in the sternness of the Order's rules, and the consequent changes in the manners of the community, together with the increase of numbers that came with time, made some additions necessary. The principal of these were contained in the large range of buildings to the south-east of Abbey.

As an example of the careless way in which trusted authorities give their sanction to popular mistakes, it may be noted that the very latest published plan of Kirkstall, one little more than six months old, shows this part of the Abbey as being in existence in the twelfth century, and moreover places the whole square with the other buildings, instead of lying as drawn on the plan before you. It is evident that the author has accepted what has come before him without properly checking plans or searching for authority; for a careful examination would have corrected the error in plotting the plan, and would have revealed the fact that not one stone of this part of the Abbey was laid in the twelfth century. The earliest work is far into the thirteenth century, the whole of the remainder fifteenth.

The thirteenth century part comprised two vaulted apartments, having ribs springing from finely-moulded corbels, and a good fireplace. An apartment also with a fireplace, and which evidently was a kitchen; and above the groined rooms what seems to have been a chapel. This building most likely was an abbot's house, and marks the first deviation from the strict government of the Order, which, in mode of life, drew no distinction between the head of the establishment and his subordinates.

There can be little reasonable doubt that the growing ostentation of the community, which needed expression in lavish hospitality, brought about the erection of the fifteenth-century part of the extension, which evidently was an addition to the abbot's house, and the provision of a guest hall, to be used for the entertainment of visitors to the monastery.

It is a curious illustration of the changes in the character of building at different periods, that the dates of the various parts of the Abbey can be traced on the plan, without referring to moulds or other evidence of age, by merely noticing the different thicknesses of the walls. The twelfth century ones were massive in their width, the thirteenth thinner, the fifteenth thinnest of them all.

Not long after the last alterations and additions were made to the Abbey, the Dissolution emptied it of its inmates, left the buildings to the ruin of decay, and brought them by degrees to the condition in which they stand. From 1540 to now, nothing of any great moment has been done to preserve one of the most precious monuments of antiquity from destruction. Its builders, with the sincere honesty in art characteristic of the Middle Ages, built, not for a day, but for all time. It was not the inherent defects of the buildings that brought ruin upon them, but the

neglect of all precaution, inevitably fatal to all work of man. The heritage left by the artists and artisans of the twelfth century had no value for the men of the seventeenth and eighteenth. Surely those of the nineteenth hold in higher esteem the stones that carry within them the silent record of the labours, the endurance, the steadfastness of purpose of those who paved the way for our country's greatness.

HINDRANCES.*

By T. HONEYMAN, F.R.I.B.A.

WHEN I received your invitation to come here and address your Society—an invitation as flattering as unexpected—I felt a very strong desire to accept it; not, I assure you, because I had anything particular to communicate, but rather—or indeed I may say solely—because I thought my coming might do something to promote an object which I have a sincere desire to further so far as it may be in my power to do so, either by word or deed—an object the importance of which your Society has recognised, and, I may say, has been among the first to recognise; I mean what in few words may be termed the consolidation of the profession—the drawing together of the various scattered associations, and the various scattered individuals into closer relationship, by bonds not merely of interest, but of amity. Now, gentlemen, I venture to say that it is the amity which most needs to be fostered and strengthened; and if we had a little more of the brotherly spirit which professional brethren are assumed to have, we would probably soon find our profession becoming more homogeneous, growing both in inherent power and in general esteem. Now I am persuaded that more frequent personal intercourse among architects would do much to bring about this more satisfactory state of matters, and although my coming among you may seem in itself a small matter, it will, I have no doubt, contribute *pro tanto* to the desired result, and form a new connecting link between the Leeds and the Glasgow societies at all events.

But, gentlemen, while I had no doubt about the propriety of coming here, I confess that, having agreed to come, I had very great difficulty in thinking of an appropriate subject of address. With no pretension to superior knowledge, artistic or technical, I wished to avoid all appearance of coming among you merely as a teacher, so that my choice of subjects was very greatly restricted. Now the subject I have chosen has this advantage at least, that appealing to common though varied experiences, it invites to mutual conference rather than debate, and allows me, as a provincial architect speaking to provincial architects, to bring before you—perhaps in some new light—things familiar, and to suggest rather than to dogmatise.

Hindrances meet us at every turn in life—and for the most part are blessings in disguise. All wise effort and activity, all triumphant patience and perseverance, springs from conflict with besetting difficulties. It is true that the great triumphs of mechanical and physical science have been won in spite of innumerable hindrances, but it is not less true that they have been won because of hindrances, and their salutary influence on the minds and characters of our greatest inventors. Indeed, we may go still further and say that it is entirely because of hindrances and the consequent strain upon our mental and physical energies that this small country occupies the proud position of leader among the nations of the earth; and that with all our drawbacks of leaden skies, and storms, and fogs, and rock-bound shores strewn with perennial wrecks, our ships carry the merchandise of the world and our ensign floats o'er every sea. In short, the very hindrances which seem most formidable, and with which our nation has struggled from its infancy, have been the means of developing our national virtues, and so giving us a pre-eminence unparalleled.

Nevertheless, hindrances are not things to be trifled with. They may be regarded as inevitable, but never as invincible; and it depends entirely upon how we meet them whether they are to turn us aside with the humiliating consciousness of defeat, or to develop latent powers through victorious conflict, and so inspire us with self-reliance and renewed faith in the omnipotence of will. And what is true of the hindrances, the interminable worries, and obstacles great and small, which we experience as individuals in domestic, social, or professional life, is not less true of those which in a broader sense may be said rather to affect certain interests or classes, and which must be met not so much by individual effort as by organised co-operation. But, in dealing with these common hindrances, special difficulties confront us; and whereas it might be thought that an association, by the weight of numbers, the adhesion of common interest, and the impetus of identical motive would carry all before it, yet, in point of fact, we find that such combined efforts are, for the most part, only partially successful, and that the force of numerical weight and identity of interest is too often counterbalanced by the supineness of some, or the jealousy, stupidity, or obstinacy of others. Men of energy and true valour, who rather rejoice to grapple with difficulties which seem to be "foemen worthy of their steel," are, when associated

* A paper read at a meeting of the Leeds Architectural Society, March 6.

with the timid and irresolute, too often discouraged and paralysed, and so, in corporate action, there is always a great danger of weakness and procrastination. In other words, in associations or incorporations, we lack that concentration of energy and unity of will which is possible in the individual alone. Still, with all these disadvantages, we must ever fall back upon combined effort for the accomplishment of much which co-operation alone can effect; and in the case of our own profession all past experience teaches—and I trust what I have still to say may tend still more to impress the lesson upon our minds—that while each for himself should valiantly strive to surmount the hindrances which beset his path, he should not forget that there is work to be done for himself and for his profession which can only be accomplished by organised co-operation.

It is curious to notice that some men seem even to pride themselves on the fact that they are neither members of the Institute nor of the Association, nor of any other recognised Society of Architects. Quite recently, indeed, I noticed an architect spoken of approvingly (in a public journal) because he had kept aloof from all such associations, and as if he thereby assumed a more dignified or distinguished position. It is hardly possible to imagine a conceit more ridiculous. The man who deliberately refuses to recognise the institutions of the profession to which he belongs is unworthy to be acknowledged as a member of it, and so far from thereby exhibiting superior judgment or dignity, what he does exhibit is littleness of mind and contemptible selfishness, and I trust the day may still come when all such unworthy members of our profession may be outside our institutions, for no other reason than this—because they cannot get into them.

But, returning to our text, I shall ask you to consider for a little some of the hindrances which affect us architects, our profession, and our art.

Then, I shall refer to those difficulties which affect us more particularly in our individual capacity as architects. But while I attempt to make an arbitrary classification in this way, I may remark, parenthetically, that what affects us as individuals cannot but affect in some degree our profession, and our art also.

Education.

The hindrances which we must face begin with our education. Here young men in metropolitan offices are supposed to have an immense advantage over those in the provinces. Their way is made plain before them; they have South Kensington, the Royal Academy, the Architectural Museum, the British Museum; and, besides all these, they have that most admirable institution the Architectural Association, with its lectures and classes and its kindly and helpful fellowship and emulous enthusiasm. It is hardly possible, indeed, for the earnest student of Leeds to look over the syllabus of the Association for the session 1882-83 without feelings of envy, if not of despondency. He has nothing of the kind to turn to, and the want seems to him a formidable hindrance and discouragement. The pupil finds many other difficulties in his way, wherever his lot may be cast; but I must confine myself to this—this which is peculiar to non-metropolitan pupils. Now, first of all, I should like to encourage my young friends here and in other provincial cities and towns, by pointing out to them that there is some danger of exaggerating the benefits of such aids as I have referred to. They undoubtedly facilitate the progress of the man who is in earnest; but the man who is in earnest can learn all he needs in his profession without them, and I do not hesitate to say that he can learn that nowhere better than in a provincial office if he sets himself resolutely to the task.

If you wish to make the ascent of many of our northern mountains, you will find that if you follow the usual tourist's track you may, with comparative ease and comfort, get a good way up on a pony's back, and for a time you may look down with considerable complacency or companions on foot, struggling among the rocks and heather of the steeper acclivity; but when the beaten track ends there is still a tough bit of work to be done—a piece of work which will generally be best done, and soonest done, by the man who has never climbed a hill upon a pony's back, but who has trusted to his own legs to bear him and his own eyes to guide him. The man who means to scale successfully the highest eminences, who has the Jungfrau or Mont Blanc before him, will find it better training to climb Ben Lomond from Inversnaid rather than from Rowardennan, or Goatfell from Corrie rather than from Brodick.

With the aid of the pony no doubt you reach the summit with less exertion than without it; and without such aid many a one who has stood on the top of Ben Lomond would never have reached even that modest elevation; but the enthusiast in mountain climbing not only enjoys the exertion, he profits by it, gaining strength and nerve, skill and self-reliance. Our native hills become too tame for him, and he seeks new fields for conquest in other climes. Now, far be it from me to disparage the metropolitan students' many helps—without them many a one who has attained to eminence would probably never have done so—but my present object is first to encourage the young men of Leeds to believe that even without these coveted privileges they can if they will turn their hindrances to their profit, and rise superior to the

general ruck of mediocrity; and, secondly, to suggest that what can be done to facilitate professional education here and elsewhere ought to be done, both by students themselves, and by their seniors acting together in such societies as this. Without going into any detail here—which time forbids—let me mention only two lines of practical usefulness open to us. First, we may do much to further the movement which seems now at last to be taking shape among us for the establishment of technical schools in our larger towns. Such schools may be of immense use, not only to our students but to the men who are to carry out our designs, and it seems most fitting that our societies should take an active part in trying to secure for their localities the advantage of such institutions. In a movement of this sort we cannot do much as individuals, but united in such associations as this we may exert considerable influence, and give good advice, and I venture to say that it is our duty to do so. Then, secondly, we can do much to remove a serious hindrance to the earnest student of limited means. I mean the want of good books of reference. Good books will do the student no harm. They are not like the pony, but rather like the alpenstock, a weapon for the strong and the adventurous. Now, even in this wealthy town of Leeds, you cannot expect to do much in the way of forming an Architectural Library, but it has occurred to me to suggest one way of getting over this difficulty which I do not think has been tried at all; and that is, that we—I mean we architectural societies—should each in our own locality endeavour to get a selection of the best architectural works added to our public libraries. I suppose in all our great centres now we have free libraries. Their purpose is not to supply light literature to the masses, but rather and primarily to give the poorer workers in science, art, literature, and mechanics, free access to the best standard works. They form, indeed, a necessary complement to technical schools, and it cannot be doubted that any suggestion likely to increase their usefulness in this respect would always be welcome. If we recommend a selection of the most valuable—I mean useful—architectural works, and from time to time the addition of new works, I think there is every reason to believe that our library committees would act upon our suggestions; and so this serious hindrance would be removed, and our students would have less cause to regret their distance from Conduit Street. But I think our duty hardly ends here. In many towns with good free libraries there are architectural students but no architectural societies. Is it too much to propose that, while it is so, we should, after mutual conference, draw up some definite suggestions for the guidance of library committees generally? In this, of course, we would expect the advice and co-operation of the Institute and the Association.

You will observe that I am confining myself very much to hindrances which I think we may do something by combined effort to mitigate or remove. Now, leaving those connected with our education, the multitude which beset us when we are fairly launched on our professional career are too numerous even to name, and for the most part must be met in single combat. I mean, therefore, to pass them over. Speaking generally, I dare say most of you will agree with me in tracing the origin of these personal hindrances and interminable worries to the stupidity of other people. It is a consoling idea, whether it be the offspring of self-deception or of fact; but, on the other hand, stupidity is an extremely difficult thing to deal with. Still, much of this troublesome stupidity springs from ignorance, and we can assist each other in dealing with that. We can, for instance, do something to facilitate and encourage the education of draughtsmen and so get quit of stupid assistants—ultimately, who knows?—of stupid architects. But, even then, I fear we would be burdened in many ways by stupid clerks of works. Can we do nothing to mitigate this evil? Most of us—all of us I hope who have been any length of time in business—must have come across thoroughly efficient clerks of works, men of probity, skill, and tact, helpful alike to the architect and the contractor; but such men are rare, while numbers crowd into the office destitute of every qualification except honesty, and even that is sometimes lacking. Perhaps you are better off than we, but there is all the more reason that you should give us the benefit of your advice. I shall not suggest anything, but only express the belief that if the different societies took the matter up in earnest and interchanged their views, some good practical result might be attained, and the grievous hindrance of inefficient clerks of works might perchance be removed. I must add that I think there is much in the article on this subject in last Saturday's *Architect* well worthy of consideration.

Incompetence.

From the numerous hindrances which affect our profession—which we bear together and must face together—I take the following small selection—incompetence, excessive competition, want of unity. Any one of these would form a good subject for an essay, but I must be brief, perhaps, to crudeness. First, nothing is more calculated to bring discredit upon our profession than the incompetence of those who are publicly recognised as architects. It may be quite true—I believe it is—that the great majority of the architects of this country are well worthy of the position they assume; but how many are there utterly unworthy of the name—

ignorant, presumptuous, and unscrupulous. We have, no doubt, the presumptuous and the unscrupulous in every profession; but I question if you will find so large a proportion of the ignorant in any other—of course I mean ignorant in the sense of being deficient in professional knowledge through insufficient or inefficient professional training. Now, it is the practice of such men which degrades to a certain extent our profession in the estimation of a too superficial public; because, while the conduct of any half-dozen of you, gentlemen, might pass without comment as you pursue the even tenor of your way, doing your duty and doing it well, the conduct of one single self-styled architect who should mislead his employer or swindle him, would be noised abroad; the absurdity of his conduct or the villainy of it would be on everybody's tongue, and it would be even popularly surmised or insinuated that architects generally were a bad lot. Now, this sort of thing is a great hindrance in the way of our profession holding the place to which it is justly entitled in public estimation; but it is a hindrance which I venture to say we are quite able to clear out of the way if we choose. I believe it simply depends upon that. If we work together with a will the thing can be done. The Royal Institute of British Architects has taken the first step towards the accomplishment of this object, by requiring candidates for admission as associates to pass an examination. The development of this scheme must be gradual; but with the aid of provincial societies it may, and I trust it will, become exceedingly comprehensive. Having thought over the matter a good deal, the conclusion I have arrived at is this—that the only way to protect ourselves against classification with the disreputable parasites of our profession is for everyone of us to be able to claim membership of the Institute as fellows or associates, or at least as holders of a diploma; and do not think me utterly utopian if I say that I believe such a general adhesion to the Institute to be perfectly practicable. The Institute examination has very properly been made easy in the meantime. By degrees, no doubt, it will become more stringent, especially as a test of practical and artistic attainments, and experience will guide us to the happy medium of necessary acquirement. Now, while it is quite competent for us in Glasgow or you in Leeds to establish local examinations, and to exclude from our membership all who cannot pass them, and to allow those who do to add to their names initials such as we use, I.A., or what might stand for Associate of the Leeds Architectural Society—the doleful affix, A.L.A.S.!—still it is clear that such distinctions would have no weight with the public, compared with similar distinctions conferred by a recognised national association. The significance of such a distinction would soon be appreciated, and few who could have it would care to be without it. At present, as I have said, the operations of the Institute in this direction are somewhat tentative, but the council has shown every disposition to meet the wishes of provincial societies, and to court their aid and advice; and I trust we shall not be found to stand idly by and proffer neither. What seems chiefly needed to facilitate the reform indicated is, some modification of the Institute's rules; and hearty co-operation on the part of all those most useful provincial societies which can effectually aid the central body, but can never be superseded by it. I have only time now in this connection to mention two points which I think specially worthy of our consideration—1st, young men should be encouraged to go up for the Institute examinations even if they do not wish to become members, and should be entitled, if they pass, to use distinctive letters such as D.R.I., or anything of the kind which may be thought more suitable. But, 2nd, as membership is, to some extent, a guarantee of character as well as of proficiency, it is most desirable that the annual expense should be so reduced as to form no barrier to the admission of anyone who proves his worthiness. The poverty of members will never bring disgrace either on the Institute or the profession. I think we can hardly be too considerate in this matter; what I apprehend we wish to see is, in few words, this; all who should be recognised as members of our profession possessed of some distinctive token, not too easily obtained, but once obtained, retainable at the smallest possible annual expense. I must leave these hints and pass to my next hindrance.

(To be continued.)

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE president and upwards of thirty members of the Edinburgh Architectural Association visited Leith on Saturday afternoon. At an appointed hour they were received in Trinity House by the Master, Captain Thomson, and Mr. Carstairs, secretary, who explained that the Institution was established in 1380, incorporated by royal charter in 1555, and was therefore one of the oldest corporations known. The visitors were conducted to the grand hall, where they had an opportunity of seeing the portraits of several of the old masters of the establishment, including the present one. Conspicuous as works of art were several paintings by the late Sir Henry Raeburn, those representing Admiral Lord Viscount Duncan and Mr. George Smith attracting the most attention. A considerable time was spent in examining the grandly

executed conception of the late David Scott, R.S.A., entitled *Vasco de Gama Doubling the Cape of Good Hope*. The other objects of interest were the autographs of Queen Victoria and Prince Albert, a flag upwards of 500 years old, and several models of naval architecture, including one of the ill-fated *Royal George*. The exterior of the building and the adjoining hall were inspected, and a careful examination made of ancient panels and pieces of sculpture. By the courtesy of the Leith Dock Commissioners the docks were visited, and Mr. Broadrick, the superintendent, kindly acted as guide, and imparted the most lucid explanations, both oral and ocular, with regard to the hydraulic machinery. He also pointed out that the docks were unique in their having upwards of twelve miles of railroad in connection with them. The association next placed itself under the care of Mr. Simpson, the town architect, who explained the recent improvement scheme, and led the members to view those of the old buildings in obscure parts of the town which are rich in possessing objects of antiquarian interest. It was subject of great regret that so many apartments in old structures had been subdivided, and so thickly coated with whitewash, as much old and ornate plaster-work had thus been lost, although traces of it yet exist, as notably may be seen in those rooms set apart for the retainers of Mary of Lorraine. The North and South Parish Churches were inspected, and Mr. Simpson fully explained the nature of the changes and restorations which they had undergone.

THE STREET MEMORIAL.

A MEETING of the committee for erecting a memorial of the late Mr. Street, R.A., in the new Law Courts, was held on Monday in Mr. Armstead's studio, under the presidency of Mr. Beresford Hope, M.P., the chairman. The Prince of Wales was present. Mr. Armstead, R.A., exhibited a model of the proposed memorial. After inspecting this and a more elaborate, and, in many respects, better design originally prepared, but impracticable with the funds as yet subscribed, the Prince of Wales proposed the following resolution, which was seconded by letter by Sir F. Leighton, P.R.A., and carried unanimously:—"That this meeting approves Mr. Armstead's design for the Street Memorial, and authorises the sub-committee to make arrangements with him for carrying it out for a sum, if possible, of not less than 2,000*l.*, subject to such modifications as may be deemed advisable in the pedestal." A vote of thanks to His Royal Highness for his presence and valuable assistance having been proposed by Mr. Shaw-Lefevre, and carried by acclamation, the proceedings terminated. The design consists of a life-sized figure of the architect, seated and at work on a plan, which lies unrolled across his knees. The idea and treatment of this part of the memorial met with general and hearty approval, but it was felt that the treatment of the base or pedestal on which the figure rests has suffered from want of means, and that a strong effort should be made to obtain additional and increased subscriptions to enable Mr. Armstead to carry out this portion, also according to his original conception. To accomplish this a further sum of about 600*l.* will be required.

STEAM CRANES AND WIND PRESSURE.

ON the 6th inst. a man was killed in Reading by the fall of a steam crane, which was used in a building in course of erection. It was fixed on a platform about 63 feet from the ground. The crane had a jib, or arm, about 60 feet long, and was capable of lifting and swinging into position weights of three tons. The crane rested on a platform which was supported on three stages, or scaffoldings, the main one being 12 feet in diameter, and the other two 6 feet in diameter, and there is no doubt that they were thoroughly well constructed. It was first used on the 5th inst., when it placed in position fifteen out of eighteen iron columns, weighing 35 cwt. each. This work was resumed on the next morning, and continued up to the time of the accident. The *Reading Mercury* says:—"The crane was at the moment standing still, the driver taking in water; and the column attached to the jib was hanging about 30 feet from the ground, and about 40 feet from the base of the stage supporting the crane, and on the south-western side. Unfortunately at this moment, when considerable strain was on the machine, a violent gust of wind (the day being stormy) came from the north-east, and the result was that either one of the smaller stages gave way or the pivot of the crane snapped. The whole mass, weighing about nine tons, and a large portion of the platform on which it stood, fell to the ground with great violence. There were four men on the platform at the time; and the poor fellow Cox was carried down with the falling mass, the others escaping in a marvellous manner."

At the inquest, Mr. W. Morgan, of Kilarnning, Scotland, who constructed the crane, said:—"We have supplied a considerable number of cranes for like work. We have erected a crane on scaffolding 10 feet higher than this—70 feet. We have made cranes of this particular class for twenty years, principally for

London. We have nothing to do with the erection of the staging, as a rule, but I always examine it carefully and give my opinion. The engine and crane are combined—they are in one structure. As far as I can see from the nature of the scaffolding that has fallen, I think the wind had most to do with the accident. The weight was hanging from the crane in the direction that the wind was blowing from. It would be difficult now to say if there was any defect in the structure, because the stage is all to pieces. The leg, in my opinion, crushed through the staging from the effect of the wind, and when that took place the crane would come down. The wind and the weight together were more than the strength of the stage could resist. Wind is a thing we cannot calculate upon. We do not know the strain it took to break the stage down. The stage is rather stronger than the last stage on which we fitted a crane in London, and which was about the same height. It is a medium-sized crane, and there was nothing out of the ordinary way in its construction. It was calculated to carry three tons, in a radius of about 40 feet from the pivots, where the angle of the jib would be about 65 degrees. The crane and engine together weigh nearly nine tons, roughly speaking. I have never known a similar accident. It would no doubt have been safer to have stopped the work during a high wind; but the foreman on the ground would not be able to judge the force of the wind. I know the crane was quite safe. With the column suspended at the distance it was—about 40 feet—I calculate the strain on the pivot of the crane, without the wind, would be nearly three tons. I have examined the pivot since it has broken, and I don't find any fault with the quality of the iron. The iron in the pivot is what is known as "Glasgow best brand."

Mr. Chas. Smith, architect, said: By the wish of the coroner I have examined this structure. Any opinion I have formed is from my general knowledge of structural works, but I have never had anything to do with any crane erected in this particular way. The centre stage is 60 feet high and 12 feet in diameter, tied together with lattice-work, and in the centre a baulk of timber, intended to carry the main weight. There were also two smaller stages of the same height, but only 6 feet in diameter, and braced in a similar way, but with lighter materials. The crane was secured to those structures by a chain passing round the end, and extending down the centre of the erection, and secured to the ground by planks which were weighted with bricks. The opinion I have formed of the matter is this—that the structure was formed to support the dead weight, but that there was not sufficient care taken to provide against a possible lateral or side thrust, or oscillation. Owing to the direction of the wind and the jib of the crane with the column attached they got a double strain, the column being swung to the south-west and the wind blowing from the north-east. I do not think sufficient care was taken to secure the side stages against such an extraordinary strain as a strong gust of wind. My theory is that the smaller stages should have been secured by diagonal ties, in not less than three directions. My theory of how the accident happened is that the great power of the wind, acting on the stage which fell, and on the crane, caused a "rick," which severed the iron at the main stage. This caused the rick of the outer stage, and then the iron gave way. The crane itself, so far as I saw, was not attached by bolting to the platform, but simply stood on it by its own weight.

The Coroner: If you had seen the stage and the structure before the accident do you think these things would have struck you?—That implies that "it is well to be wise after the event." A structure 60 feet high, and only 6 feet in diameter, does seem a weak structure; but it is a very difficult thing to form an opinion as to what one would have done under the circumstances. You have heard that this was as strong, or stronger, than other structures of the kind. Any slight oscillation would create an enormously increased strain. I don't at all say that guy chains would have prevented the accident.

Have you any reason for doubting that if it had not been for that very exceptional gale on Tuesday, the whole thing would be doing its work at the present time?—There is sufficient evidence to show that it did its work up to that time. The extra gust of wind undoubtedly brought it down. It is the business of people who undertake these works to have a sufficient margin of power for such contingencies as that?—I am inclined to think it is. There is another thing to be said about it—that the columns already deposited were in another direction to that which fell, and which was at the weakest point. Probably the greatest strain was put on it at that moment, just when the gust of wind unfortunately came.

By the Jury: I particularly noticed the iron plating which was severed, and there noticed a discolouration in part of the iron. My theory is that when the stage began to go, the strain was enormous, and quite sufficient to sever iron of any quality.

Mr. Morgan, recalled, said: In my opinion the extra stays or guys spoken of by Mr. Smith were not necessary. I did not think so at that time. I have never known them used, although I have inspected a great number of stages. This stage is very much exposed to the wind—as much as any I have seen to the particular direction of the wind on Tuesday.

By the Jury: From my experience of this accident I shall not consider such staging sufficient for exposed places in future.

The following verdict was returned:—It is the opinion of

the jury that James Cox came to his death through the falling of the crane by accident, the chief cause being a sudden gust of wind at the time, whilst the jib was at the weakest point.

THE NEW EDINBURGH THEATRE.

A MEETING of the Dean of Guild Court, Edinburgh, was held on the 8th inst., when the plans of the theatre which is to be erected in Grindlay Street for Messrs. Howard & Windham were submitted for examination. The building will be of an Italian type of architecture, the front having a central parapet surmounted by a pediment and flanked by Corinthian pillars. Three doorways, sheltered by a verandah, will lead into a spacious vestibule, from which access to the dress circle and stalls will be obtained. The flanks of the façade will be pierced by doorways admitting to the pit, amphitheatre, and gallery. Accommodation will be provided as follows: In the circle, 200; private boxes, 60; orchestra stalls, 116; pit, 800; amphitheatre, 400; gallery, 1,000. As in the Savoy and Strand theatres, there will be no proscenium proper, the stage opening, which will be 28 feet wide by 32 feet high, being surrounded by a gilded frame. The stage itself will be 40 feet deep and 60 feet wide.

Mr. C. J. Phipps, the architect, attended, and in reply to the Court stated that there were to be iron railings on both sides of the staircases. The Court considered that the seats in the pit were too long, as they stretched from one side to the other, and it was suggested that there should be a passage down the centre. Mr. Phipps remarked that the highest authorities were now of opinion that there should be no break in the seats, and that the surrounding gangway or passage was sufficient. Where there was a centre gangway people blocked it up by standing, and it was difficult, if not impossible, to remove them in the event of a crowd. Ultimately the Court agreed to dispense with the centre passage, on the understanding that the passage surrounding the seats should be widened to five feet. Mr. Phipps agreed to give effect to a number of suggestions. In reply to the Dean of Guild, Mr. Phipps said, in regard to an iron curtain dividing the stage from the auditorium, that no special arrangement had been come to. It was a matter on which much difference of opinion prevailed all over Europe. Iron curtains that had already been put up in theatres were being taken down because one had fallen down. Captain Shaw, the chief of the London Fire Brigade, disapproved of them altogether. He (Mr. Phipps) was now, however, considering with Mr. Wilkins, the firemaster, whether to adopt a special curtain proposed by him. If they did not put up an iron curtain, they proposed to put up one made of asbestos cloth. The Court then granted the warrant for the erection of the building.

THE PRINCIPLES OF ETCHING.

A LECTURE on the "Principles of Etching" was delivered by Mr. Seymour Haden, F.R.C.S., at the Midland Institute, Birmingham, on Monday. Mr. Haden, in explaining that these lectures would be similar to some which he delivered before the Royal Institution four years ago, mentioned that while he intended those discourses to do nothing but good, they, to a certain extent, did harm. They did good, inasmuch as they led to the formation of a strong society for the restoration of a lost art, but they did harm, inasmuch as they set a number of untrained people to etch. As he was extremely anxious that that error should not be repeated, he would at once say that etching of all arts was the least adapted to the amateur. It was not a rudimentary but a final art, and required as long and continuous a training as did that of the painter. In fact it was even more difficult than painting, and great painters, such as Gainsborough, Crome, Constable, and many others had failed to excel in it. Lest anyone might think that his own case was a contradiction to this statement, he explained that circumstances had led him to become for many years as much an art student as a surgeon, and he never ventured to produce an etching until he was fifty. In explaining what were the principles of an art, it was easier to do so by approaching the matter from the negative side. Art was the reverse of manufacture, differing from it in that though it depended upon material agents for its outward expression, those agents were of the simplest kind, and were wholly directed by an impulse which had its centre and origin in the brain of the artist. Invest any one of those simple agencies—the brush of the painter, the pencil of the designer, the chisel of the sculptor, the needle of the etcher, the knife of the surgeon, or the pen of the author—with any of the properties of a machine, render them in any degree automatic, so as to place in abeyance the brain impulse of which he had spoken, and the result was not an art, but a manufacture. The fundamental principle of art must be personality, or originality, out of which again came ideality, invention, sensibility to external impressions, a sense of the beautiful, passion for poetry, or whatever else the artist might be capable of. He would dwell especially upon this first principle of personality or originality because

it would better enable them to estimate the difference between etching and engraving. Etching was a branch of the engraver's art, and his object in relation to it was not so much to insist that etching was the best of the reproductive processes—although that thesis might be very reasonably maintained—but to rehabilitate the whole art of the engraver by the reinfusion into it of that form of original engraving which was practised by the great masters of painting who were their own engravers. Mr. Haden proceeded to point out that in nine-tenths of the modern engravings, even the best of them, certain stereotyped methods were adopted, such as mechanically ruled lines for the expression of atmosphere and clouds, a sort of check for the surface of tree trunks, and a set pattern of lines for the expression of flesh, &c. By a limelight lantern he had projected upon a screen a magnified representation three square inches from the foreground of Sharp's engraving of Sir Joshua Reynolds's *Holy Family*, and which appeared as a sort of indefinite mottle representing nothing. He invited a comparison of this with a three-inch piece taken from the foreground of an etching by Rembrandt, in which definite and suggestive lines were used, indicating the work of an original artist. Similar comparisons were shown of sky, drapery, and flesh treatment, the lecturer pointing out that there was nothing in the nature of a pattern or set scheme of lines in the work of artist-etchers, while it was the usual thing in that of the modern engraver. Among some of the older French engravers this pattern-work was invariably found when they were merely imitating the painting of another artist, but it disappeared whenever the engraver had to exercise his own originality. He therefore attributed the debasement of engraving which had taken place to the circumstance that, the engraver becoming only a copyist, the originating faculty had been in abeyance. It had become not an art, but an "art manufacture." Mr. Haden said it astonished him very much that the Royal Academy was every day, even now, electing into its body, with full honours and advantages, the producers of those unmeaning lines, and had kept at arm's length and not elected a single etcher or a single original engraver within the last thirty years.

THE BUILDING TRADE IN PARIS.

AN article has been contributed to the *Débats* by M. P. Leroy-Beaulieu, on the scarcity of work among the carpenters of Paris. He attributes it to over-building. Houses have been built during the last two years without regard to the demand for them; workmen's wages at the same time, owing to the demand for labourers to be employed in the construction of these houses, have risen exorbitantly, and now the thousands of empty houses to let have cooled the building fever. The demand for labour has consequently fallen off, and yet the workmen demand wages which deter those from employing them who might otherwise continue to build. Wages, indeed, have risen since 1875-76 no less than 60 per cent.; and since 1879-80, 33 per cent. He recommends the labourers to be more moderate in their expectations, as the only condition on which building can be proceeded with. The *Temps*, in an equally interesting article devoted to the same subject, states that the employers of labour attribute the demand of high wages by the carpenters to the payment of high wages by the municipality to those whom it employs. The wages paid in Paris are exceptionally high. In the provinces they are so much lower that the employers can send up and offer carpenters' work on the Paris market at from 15 to 20 per cent. lower prices than the Parisians can afford to take. This system of the municipality is designed to render it popular, but it is really stamping out Paris carpentry.

EASEMENTS OF LIGHT.

THE following communication respecting easements of light has been sent from the Council of the Manchester Society of Architects to the Committee of the Institute:—

This question has been carefully considered by the Council of this Society, and we are requested to transmit to you its opinion. The subject is a most difficult one to approach on account of the present state of the law, which, in certain events, authorises the acquisition of a valuable addition to a property without any previous payment for the same.

So far as existing old easements are concerned, this Council considers that they would be best left alone. It is quite possible that some of these old easements may have been acquired in a justifiable or straightforward manner, but the experience of the members of this Council is certainly not in accordance with such a supposition. The simple gaining of an easement of light over an adjoining property, by lapse of time only, this Council does not consider justifiable, and it would be glad to see the law altered so that, in future, each property would remain perfectly free, as it was when originally purchased, and with only those advantages which have been paid for by the purchaser. The system of gaining an advantage surreptitiously is not in accordance with the views of morality held by the Council of this Society.

This Council would also wish to see some rearrangement of the law, by which any owner of property, which has been extended or increased in height, should be debarred from objecting to a similar proceeding on the part of the owner of a neighbouring or opposite property.

This Council considers that, where practicable, it would be advantageous if questions of this nature could be dealt with by a known architect of experience in these matters (who might take his instructions from the Court and report to it). The experience of this Council is, that the majority of these questions admit of easy settlement, where the claims are really *bond fide* ones; at the same time it considers that a very large proportion of the claims are wholly unjustifiable. This Council desires us to assure you that it will willingly co-operate with the Institute in dealing with this important question, and trusts that the efforts towards obtaining some rearrangement of the present state of the law may be successful.

THE FOUNDATIONS OF WATERLOO BRIDGE.

A VERY interesting piece of engineering work is, says the *Daily News*, just now in progress at Waterloo Bridge, though considering that this famous structure was opened only about sixty-six years ago, it is a piece of work that ought not to have been necessary in our day. When, four or five years ago, the Metropolitan Board of Works purchased this bridge for 475,000*l.*, it was done, we believe, in the full knowledge that there were symptoms of decrepitude indicating a subsidence of some of the piers such as would probably demand a considerable outlay upon it. About twelve months ago the work of repair was commenced at the Surrey side of the bridge, and is now going on right in the middle of the river.

Passengers over the bridge may see indications of what is going on below; but without making a rather perilous descent from the parapet right down to the foundations of the structure they will hardly be able to form an idea of the extensive and difficult nature of the undertaking with which the engineer to the bridges belonging to the Metropolitan Board, Mr. Edward Bazalgette, is charged. The first thing to be done was to ascertain the cause of the ominous cracks discovered here and there about the bridge, and for this it was necessary to examine the foundations. Dams were made round portions of the piers by driving in huge piles and caulking up the interstices between them with oakum or puddling with clay. The water was then pumped out, and the mischief was at once revealed. The subsidence of the bridge was quite apparent. Each pier from which the arches spring is apparently based on huge blocks of rough stone of the kinds technically known as Bramley Fall and Craighleith, and these blocks have been visibly crushed down by the superincumbent mass, calculated to bear with a pressure of somewhere about 11,000 tons for each pier. The "cutwaters"—the pointed projections intended to break the force of the current against the piers—not being a part of the actual bridge, have retained their original level, and afford therefore a gauge by which the dropping of the bridge between them may be clearly perceived. To ascertain the real cause of the subsidence it is necessary to go below the "footings," the huge blocks which, as it has been said, constitute the apparent base of the pier. They in their turn rest on a foundation of wooden piles, which originally, no doubt, were imbedded to a depth sufficient to insure their perfect stability. The idea of so tremendous a mass of solid granite as Waterloo Bridge resting on wooden piles is rather a startling one, but they may have originally afforded a fully sufficient foundation. They are beech piles, disposed in rows 3 feet 6 inches from centre to centre, and combined in a solid mass by a filling-in of rough masonry. Had the river bed undergone no alteration, such a foundation would perhaps have served as long as the bridge above it held together. The river bed, however, has undergone very considerable alteration. Since the bridge was built the stream has deepened under it to the extent of 8 feet. The gravel has been washed away from the piles, and their power of sustaining the mass overhead consequently diminished, and they have sunk under it. Nothing could remedy the subsidence that has already taken place, but Mr. Bazalgette's efforts have been directed to the prevention of further mischief. Dams have been constructed all round each pier dealt with and the water pumped out at half-tide. Enormous blocks of concrete, each weighing from four to five tons, have then been lowered into position round the pier on the bed of the river, so as to constitute an "apron" from 4 to 5½ feet thick, and as hard as the solid rock. This apron slopes outward from the pier at an inclination of 1 in 5·6, and extends 18 feet all round. The outer edge of it reaches to the piles constituting the dam, and which of course run down a great depth into the bed of the stream, where the lower portions of them will be left to constitute a kind of outwork for the defence of the foundation piles should the river still go on deepening. They are massive beams of American rock elm, an intensely hard wood, well suited to this purpose. They are cut off just at the level of the concrete apron, and will no doubt effectually prevent any scouring away of the gravel beneath it. Altogether it looks to be a very neat and effective contrivance for arresting a

process which if neglected would undoubtedly eventually bring down Waterloo Bridge in ruins as complete as Macaulay's New Zealander could have desired for his sketch of St. Paul's Cathedral. Mr. William Webster is the contractor, and there are some 90 or 100 men engaged on the work, which from the river bed has a much more serious aspect than when seen from the parapet of the bridge. The middle piers are now under alteration. What will be required for those on the Middlesex side has not yet been determined, no thorough examination having yet been made. Should they have to be dealt with in the same way as the rest, the work will probably be somewhat slower than it has hitherto been, owing to the necessity of keeping a clear way for the steamboat traffic.

The Decoration of St. Paul's.

SIR,—The second letter of your correspondent, "A Country Architect," scarcely calls for remark of mine, further than may be found in my reply to his first. I will, therefore, now only ask you to allow me briefly to refer to a passage in the communication of "F.S.A." in your current issue.

In my former letter I ventured, in reference to the decorations proposed for St. Paul's, to challenge the assumption common amongst architects, small as well as great, of authoritative judgment on questions of colour.

In my wonder I asked on what credentials were such pretensions supported? It is, I take it, a self-evident proposition to state that the constructional expression of colour, and its technical control in art, can come only from a "colourist"; that the artistic sense of colour, like that of tune, can be acquired only by gift of nature; and, moreover, that such gift is of a power that will assert itself as a dominant quality in the works of its possessor.

"F.S.A." speaks of "architects" as "likely to take a broad view" of decorative colour, and "consider it in relation to other things." But may not it be asked on what conditions, short of practical proof of their possession of the colour faculty, architects can suppose this "broad view" of theirs to have any value whatever?

It may, indeed, be urged that an architect, simply because he is one, may, as a sculptor, on like grounds, be suspected of defect in artistic colour sense; nay, further, that the professional position of an architect is in these days compatible with colour blindness.

The sculptor, an artist by natural impulse, is chary of passing opinion on questions of colour; the architect, mainly professional, is on this subject always ready to rush in where sculptors fear to tread. I have already occupied more of your space than I had intended, in my aim to show that the architect must offer far more than the bare title of his calling in order to give weight to his opinion for or against works of decorative colour. Upon him, too, rests the onus of showing that the curriculum of experience in an architect's office, by a young man in quest of a genteel profession, is sufficient to support, at his hands, a claim to a mastery of decorative colour, which failed signally in those of men such as Scott, Barry, Street, and other architects in the front rank of their profession.

I am, sir, your obedient servant,
March 12, 1883. A LONDON ARTIST.

SIR,—If the "Country Architect" had honoured me by a careful reading of my letter, he could hardly have said that all I advanced in support of the proposed decoration of the dome was the authority of Wren and Cockerell. I endeavoured to maintain that, if Scriptural subjects are admissible, there is nothing incongruous in the design in which the President of the Royal Academy and Mr. Poynter are co-operating. The "Country Architect" fears their work will be lost when carried out owing to the height of the dome; if he had seen the cartoons he might be more sanguine of success. It seems to me that all his conclusions are derived from the appearance of the illustration in *The Architect*, which has the delicacy we expect in an illustration on a small scale. But surely Sir Frederick Leighton might be supposed to be able to vary his treatment of a picture so as to adopt it to the position in which it is to be placed, and to be competent to use a silver point at one time and a large brush at another. Some years ago there was a drawing of part of a tree by Sir Frederick in *The Architect*, of which it might be said that every leaf was a portrait, and the detail would bear microscopic examination. If the same tree had to be represented at a great height above the eye, there is no doubt that the delicate lines seen in the pencil drawing would be absent, and another method of producing the effect would be substituted. The design for the panel in the dome should be judged as an illustration, and no more. When the cartoons are seen in the dome they will be found to be no less effective. It is possible that on some days they will be invisible—unless we are delivered from the fog-plague—but happily November has its limits.

Objections have been raised about selecting the dome instead

of another part of the Cathedral for adornment. It would be better if the decoration of the entire building could be undertaken. But in all matters relating to church fabrics finance is supreme. It is necessary to demonstrate what is practicable in beautifying the building, and so much importance is attached to the dome in London it was politic to begin operations there. Should the decoration of the dome be successful the committee know that there will be not much difficulty in finding money for the remainder of the work.

There is a more important point at issue between the "Country Architect" and myself, and that is the propriety of the subjects. In his letter he suggests that such subjects should not be undertaken by a modern artist. According to the "Country Architect" the old painter "believed religiously in the literal truth of what he represented, whereas the other has no such faith." I doubt if this theory will bear examination. There have been painters like Fra Angelico about whose faith there is no question, but they were very few. Is it not the fact that many of the best Renaissance men employed the same brushes on Scriptural and Pagan subjects? Their lives show that they were rather lax in matters relating to doctrine, and in consequence some of them were in peril from the Inquisition. What a man believes is a personal affair, and we ought to be careful in subjecting even a painter or a sculptor to theological tests. But there is a general belief, a state religion, and it was never supposed to be wrong when an artist endeavoured to represent that belief so far as his art allowed. The works of artists are valuable when they suggest the influences which prevailed at the time the works were produced. The carvers of the royal arms, which are seen in so many churches, may have cared little for royalty, but the honest people who admired the lion and unicorn must have believed in a connection between the Church and the Crown. There are anecdotes enough which suggest that the classic sculptors were not always possessed of that religious belief in the literal truth of what they represented, which is considered to be essential by the "Country Architect." I do not like to introduce the *argumentum ad hominem*, but unless the "Country Architect" occupies an exceptional position, it is likely that he has been engaged on churches belonging to other creeds than his own. Assuming him to be a steadfast English Churchman, would he decline a commission from a Roman Catholic or a Catholic Apostolic Committee, involving the preparation of designs for pictures which (on Sundays at least) he would hold to be "travesties of Scripture teaching?" An architect in country practice is about the last man who should insist on correspondence between an artist's belief and his works.

I have occupied so much space that I cannot discuss the letter signed "F.S.A." The writer objects to my references to Wren and Cockerell. All I need say is that if an impartial reader will examine the writings of the two architects, I think it will be found that I was justified in claiming them as supporters of my views.

Yours, &c.,
A LONDON ARCHITECT.

Blythburgh Church.

SIR,—I trust the efforts of the Society for the Protection of Ancient Buildings may yet succeed in saving this beautiful church from the destruction threatened to it by restoration. Its situation in a poor and secluded part of the country has been its safety hitherto. The last time I visited it, a few years ago, I had an illustration of the utter want of any appreciation of its beauty on the part of those responsible for it. I then found that the very beautiful and rare oak lectern of fifteenth-century work had been repaired in such a manner as almost to destroy it. It had been surmounted by an elegant cornice, of which one or two of the machicolations had become broken. Its restoration was effected by simply sawing off the whole of the cornice and some other ornaments by the village carpenter.

I am, sir, yours truly,
A. PYE-SMITH.

ART SCHOOLS.

Manchester.—The Council of the School of Art have, by a unanimous vote, elected Mr. R. H. A. Willis, of the National Art Training School, South Kensington, to be head master, in place of Mr. W. J. Muckley, resigned. It is understood that Mr. Willis will commence his duties on April 2. Mr. Willis holds four out of the seven Art Masters' Certificates and portions of the remaining three. He holds two gold medals, three silver medals, two bronze medals, four Queen's prizes, and six special prizes, all from the Department and for various subjects, and one special prize offered by Mr. E. J. Poynter, R.A. He was sent by Government to Italy to study, has assisted Mr. Poynter in cartoons for the decoration of St. Paul's, and has been engaged in practical designs for sculpture, stone and wood carving, enlay, tiles, stained glass, architectural work, lithography, etching, modelling, &c., has studied calico printing, and has exhibited at the Royal Academy and at the Royal Hibernian Academy. He has also studied under Professor Legros, of the Slade School, London University.

CHURCH BUILDING AND RESTORATION.

Nayland.—The fine old porch of Nayland church has been restored, from the designs of Mr. A. W. Blomfield, architect, of London, by Messrs. Rattee & Kett, builders, of Cambridge.

Sproxtton.—The church of St. Bartholomew has been reopened after restoration. The work has been carried out by Mr. T. Woolston, contractor, of Stamford, under the direction of Mr. H. Woodyer, of Leafham.

Chiswick.—The foundation-stone of St. Nicholas' Church, Chiswick, was laid last week. The contract price of the work is 12,780*l.*, but owing to the extra depths of the foundations in vaults, graves, &c., it will exceed that sum. Mr. J. L. Pearson, R.A., is the architect; Messrs. Goddard & Son, of Farnham, are the contractors; and Mr. J. Griffiths is the clerk of works.

Tonge Moor.—The building of the church of St. Augustine, Tonge Moor, has been commenced. The contractor is Mr. G. Woods, of Bootle. Mr. R. K. Freeman, of Bolton, is the architect. The style is perpendicular, late decorated. The exterior will be built in Yorkshire parpoints, with Rainhill stone for the windows and dressings. The interior is so constructed that pillars are avoided, and the vestries are arranged underneath the chancel.

St. Peter's Church, Streatham, S.W.—At a committee meeting held at St. Peter's Vicarage, Streatham, on Saturday, March 3, plans for the completion and enlargement of the above-named church were submitted by the architect for the committee, Mr. Geo. H. Fellowes Prynne, A.R.I.B.A. The plans were formally approved as being in accordance with the general scheme previously submitted and passed, and resolutions were passed to the effect that the west end should be carried out as soon as possible according to the design submitted, and that the architect be instructed to have the plan and exterior perspective lithographed.

Jesmond.—A new Wesleyan church has been opened at Jesmond. The building comprises church, vestries, class-rooms, and lecture-hall. There are 830 sittings, and the total cost will be about 10,500*l.* The contractors for the mason and joiner work of the building were Messrs. Lishman & Salter, Ryton; Messrs. Beck & Co., slating; Messrs. Copland & Rollo, painting; Messrs. Thompson Brothers, Leeds, glazing; Mr. Atkinson, Newcastle, entrance screens; Mr. T. R. Spence, Newcastle, stained glass for the vestries and lecture-hall; Messrs. Walker & Emley, Newcastle, heating apparatus; Mr. Snooks, Newcastle, pulpit; Messrs. Sherraton & Ovens, Preston, stone carving; Mr. Abercrombie, Newcastle, wood carving; Messrs. Beatty Brothers, Carlisle, red freestone for banding the building; and Messrs. Porteous & Co., Grainger Street, lecture-hall seating. Mr. Allen has acted as clerk of the works. Mr. J. J. Lish, Newcastle, is the architect.

SCHOOL BUILDINGS.

Leicester.—A new Board School in Milton Street has been lately opened as a mixed school. The buildings consist of three storeys, and accommodation is provided for 254 children, with the allowance of 8 feet of space per child. Mr. Edward Burgess is the architect, and the contractors were Messrs. Clark & Garratt, the contract cost being 4,599*l.*

Walsall.—A new block of school buildings has been opened in Wolverhampton Road. The cost of the school, including site, has been about 5*l.* 12*s.* per head for each scholar. The architect is Mr. Samuel Loxton, of Walsall. The contractor was Mr. J. Guest, of Brettell Lane, Walsall. Accommodation is provided for 850 children.

Sexey's County School, Somerset.—In November of last year the visitors of Hugh Sexey's Hospital at Bruton issued invitations and instructions to a limited number of architects to prepare plans in competition for their proposed school to be built near Shepton Mallet. All the architects invited submitted plans, their names being Messrs. Carpenter & Inglelow, Messrs. Paull & Bonella, Messrs. Giles & Gough, of London; and Mr. G. J. Skipper, Norwich. The visitors forming the building committee had two or three meetings to examine the designs, and on February 24 a general meeting of visitors was held, when, after prolonged discussion, Mr. E. J. Skipper was selected architect, his alternative set of designs being adopted for execution. Each of the unsuccessful competitors received 20*l.* towards their expenses. It is proposed to expend about 9,000*l.* upon the new buildings.

Workington.—The memorial-stone of a Wesleyan Sunday-school has been laid. The architect is Mr. W. L. Eaglesfield. The contractors are: For mason's work, Messrs. Marland & Eilbeck; joiner's work, Mr. Arthur Benson; plumbing, painting, and glazier's work, Mr. W. Wildridge; plastering, Mr. W. Rule; slating, Mr. J. Turnbull; and heating, Mr. E. M. Richardson. The estimated cost of the work is 1,000*l.*

Workington.—The School Board have adopted plans which were submitted in a limited competition for the Westfield school by Mr. John Howes. The other competitors—Messrs. Scott &

Murray and Mr. G. D. Oliver, of Carlisle—protested against the decision of the committee on the grounds that the successful competitor's estimate was for a building of cement, while theirs were for stone, and consequently the conditions of the competition were not equal. They also objected to the Board adjudicating upon the cost of materials without calling in professional advice. The chairman said that the result of the competition had been that several hundred pounds would be saved to the ratepayers. In the St. Michael's new school they had gone in for rather a good class of building. It was a very public place, and the school had been made more ornamental on that account. But at Westfield there was not the same cause for schools of such elaborate appearance. The former had cost about 7*l.* per head, but they expected the Westfield school would only be between 4*l.* and 5*l.*, probably much nearer 4*l.* than 5*l.* The thanks of the Board were voted to the unsuccessful competitors for the pains taken by them in the preparation of their plans.

NEW BUILDINGS.

Aberdeen.—A new hospital for incurables has been commenced at Aberdeen. The site is high-lying, with a southerly aspect. The front faces the south, and extends about 145 feet. The south and east elevations are to be built of hammer-blocked Rubislaw granite, with belts and dressings of Kemnay granite. A corridor will run the whole length of the house, and will be lighted and ventilated by windows, not only at each end, but in the centre. The male patients will occupy one half of the building, and the female patients the other, the total number of patients for which provision will be made being between fifty and sixty. The wards are 14 feet high, securing 1,300 cubic feet of air space for each patient. There will be a doctor's and visitors' room, and ample accommodation for the matron, the nurses, and servants. A "lift" will be provided for the purpose of enabling the more feeble patients to get from one floor to the other. On each floor there will be bath and other accommodation connected with the house, but separated by a lobby, with thorough ventilation. The wards and corridors will be heated by hot air ventilating grates. The architects for the new buildings are Messrs. William Henderson & Son. The cost of the work will amount to between 6,000*l.* and 7,000*l.*, and the contractors for the various works are—Mason-work, Messrs. George Ogg & Son; carpenter work, Mr. John Henderson; plaster-work, Mr. James Bannochie; slater-work, Mr. Alexander Murray, and plumber-work, Messrs. John Blaikie & Sons.

GENERAL.

A Bust of Sir Rupert Kettle has been executed by Mr. Charles Noke, of Worcester.

Mr. Lewis F. Day has prepared the design for the medal which is to be awarded at the National Fisheries Exhibition.

Plans by Mr. T. S. Peace, architect, have been adopted by the Kirkwall Harbour Trustees for the proposed new works in connection with the harbour extension.

A Contract for 50,000*l.* has been taken for the construction of sea wall and promenade for about a mile in length at Bexhill.

Messrs. J. Oswald Gardner & Co. have obtained the first premium in the competition for a design for the Spitalfields Market roof. There were eighteen competitors.

The Patent Manchester Grates have been used in the new Board Schools at Reading. They were manufactured by the inventor, Mr. E. H. Shorland, St. Gabriel's Works, Manchester.

The Royal Institution, Manchester, is to be altered so as to utilise all the space on the ground floor as well as the upper rooms for exhibitions.

Withernsea Pier, which cost 14,000*l.* to erect, has been partly destroyed in the recent storms. The saloon contained the fittings which formerly belonged to the *Bessemer* steamship.

The first Fine Art Exhibition held in Elgin was opened on Tuesday. Among the exhibits are many pictures from well-known painters, local art being well represented.

Mr. Pearson, R.A., will shortly inspect the parish church, Leeds, for the purpose of advising as to the decorations proposed to be carried out. Plans for the works of improvement have been prepared by Mr. C. R. Chorley, of Leeds.

Mr. W. Preston has given to the Walker Art Gallery, Liverpool, *The Intruder*, a painting by Mazotta. Some late purchases for the same gallery include Mr. John Pedder's picture, *Sheep Washing in Cheshire*; *The Thames at Deptford*, by Mr. J. H. Dawson; and *The Pedlar*, by Mr. Fred. Morgan.

Mr. Ruskin delivered his first public lecture since his appointment to the Slade Professorship, at the Union Museum at Oxford on Friday in last week, the subject being "Recent English Art." The building was crowded, and a large number of people were unable to obtain admission. Under the circumstances, Mr. Ruskin consented to repeat the lecture on the following day.

Jesus led to Crucifixion.
and J. Rogers R.S.A.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MARCH 17, 1883.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."*

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK,
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

DISSIPATED ECLECTICISM.

WHAT can an architectural lecturer mean—and a clever one too—when he tells us to “remember LOT’s wife?” “It is a blessed thing,” says Mr. SEDDING, “to be able to make breaches in the four walls of present circumstances. The system of design that never gets beyond the tether of the leading-strings of antiquity is not a living thing. The ancient example which, to my mind,

is calculated to impart the most useful lessons to the modern architectural designer is that of LOT’s wife. *Remember Lot’s Wife!*”

Professor RUSKIN—may we be permitted to congratulate him, and the world, upon his assumption once more of the title?—whose somewhat wayward use of the English language has no doubt given rise to such transcendentalism as this in many other admirers besides Mr. SEDDING, tells us, for example, more than once in the course of his many and devious wanderings of thought, that “it is not possible to have any right morality, happiness, or art” in a country whose cities are “clotted and coagulated” by being built in regular blocks of houses, “spots of a dreadful mildew spreading by patches and blotches over the country they consume.” What a country which really possesses morality, happiness, and art will really and consequentially develop in the way of civic architecture is “lovely cities, crystallised, not coagulated, into form, limited in size, and not casting out the scum and scurf of them into an encircling eruption of shame”; and if this “is impossible,” “it may be so,” says Mr. RUSKIN; he has “nothing to do with its impossibility, but only with its indispensability.” The final touch of declamation in this extract is characteristic beyond all else—characteristic of the entire repudiation of mechanical logic without which no sort of transcendentalism at all is worth having; but what could even Mr. RUSKIN mean if he were to tell us to “remember LOT’s wife?” What we do remember of her is that she was a typical woman, impelled by a mingled feeling of housewifely thrift and feminine curiosity to cast a look behind her as she left her home hurriedly for ever; for which act of indiscipline she was changed into a “monument” of salt. In what way, then, are modern English architects to be compared to this unfortunate, because too thoughtful, matron? For what reason—beyond the jingle of words, perhaps, and the confusion of ideas—should the young gentlemen of our London Architectural Association be warned by their last lecturer to “remember LOT’s wife?”

To be serious—if it be possible in the face of a proposition so very highly figurative—we can scarcely imagine a perfectly sane and exceedingly smart lecturer to have permitted himself to make such a dismal joke as this without some solemn motive. For one thing, we find him “craving indulgence in the presence of young men”—and, we should say, probably not very successfully—while he “deprecated the prevailing practice” of inviting them “to design.” “I never,” he says in his epigrammatic way, “I never encourage a young man to design at all. What is the good of a young architect spinning thoughts out of brains whose fibres are not equal to the strain of weaving? Let him *read his Ruskin*; . . . go to concerts; read poetry, prose, and romance; and combine with this all that he can possibly cram up of the history and composition of glue, of the newest electric light, the choicest method of laying drains; . . . let him draw and study flowers, foliage, animals, men, birds, trees, rocks, glaciers; let him seek to gather all that is ‘fair and fit’ in all creation; but not design.” To put it briefly, let the architectural student study the transcendental writings of Mr. RUSKIN and leave the exercise of architectural art alone. “The long and the short of it is,” says he in another place, architects are “suffering from dissipated eclecticism”; and probably we are not far wrong when we suppose that this is why we are to remember LOT’s wife. What this unhappy *materfamilias* did was to look behind her in a spasm of dissipated eclecticism; and what English architects are doing is a similar looking behind them. The patriarch’s helpmate

was metamorphosed on the spot into so much chloride of sodium; we, if we do not take care to avert our eyes from beholding the now-forbidden vanities of the past, may be similarly converted into we know not what spiritless, soulless dysaltery of art. What a pity it is that nobody ever treats the Royal Institute of British Architects to such powerful doctrine nowadays! The last of the lecturers of that great Institution who indulged in similar exhortation is now, alas! bound hand and foot with secretarial tapes and laces, and all the fun is for ever over and gone. Imagine the countenance of Mr. President HORACE JONES if Mr. Secretary WHITE were to recover himself for a moment and call upon the meeting, in his own old way, to remember LOT’s wife! And yet, if the argument which lies concealed in these words, burning its way out of the bosom of Mr. SEDDING, so urgently demands expression on the basement storey of No. 9 Conduit Street, how much more important must its utterance be upstairs?

Mr. SEDDING, personally, has not been hitherto regarded as a reformer of architectural taste; but he has “read his RUSKIN,” and perhaps, like this favourite exemplar, he is able to enjoy in some degree the fierce delight of being run away with by the wild horses of language. For the occasion he is enamoured of the idea of artistic independence—as many another like him has been enamoured before—and that is enough. Why should we not aim now and then at independence? “What should be our attitude,” he says, “to old art? This is really one of the great questions of the day.” “It is true we have no living art to fall back upon, but we have one to make.” “There are many ways in which modern work may not only vie with, but beat old work.”

In further connection with the “idolatry of old art,” of which he complains as the sin of LOT’s wife, it appears to Mr. SEDDING that we are suffering from a kind of penitence for our failure in reviving mediæval art, and for the fallacious judgment of real principles out of which that failure has been developed with so much fuss and pretension, so much cry and so little wool. Not long ago “we were taught,” he reminds us, “to cross ourselves at the sight of the Perpendicular; and as for the Renaissance, even the most artistically-elaborated vindictive of Mr. RUSKIN” (still harping on our RUSKIN) “could not fitly express one tithe of the loathing all pious-minded people should instinctively feel at the ungodly results of ungodly types of art.” Does Mr. SEDDING still cling to the Oxford Graduate, or has he flung him aside? Amongst other things it is really not clear what his attitude is in this respect. “Broader views,” he goes on to say, “now happily obtain; yet the errors of past prejudice have left their stings behind them.” To pursue this expressive if somewhat halting metaphor a little further, it would seem that we must regard the broader views of the passing day as a sort of relief from the pernicious attentions of a plague of Gothic flies, which, however, in retiring from their more aggressive operations, have left in our flesh the still undiminished activity of their tails. In plainer language, the Gothic fashion has departed from us, but Gothic practices and Gothic principles still linger ranking in a hundred wounds of their making. This seems to be what Mr. SEDDING means; and we are constrained to think, as regards modern English Gothic, it is more severe than civil. If the remembrance of LOT’s wife is to be the acceptance of this doctrine, we are almost prepared to advise our students of architectural art to trouble themselves no more about her. Whatever is to be the future of English architecture, no one surely can help entertaining the belief that those principles of honest articulation and unsophisticated masculine purpose with which our Gothic revival has unquestionably made us acquainted, must for a long time exert an influence for good upon the whole of the art of this country.

As for “dissipated eclecticism” (the formula being an exceedingly clever one), we must no doubt plead guilty to a very considerable extent, on behalf of all modern architecture, to the charge of having too frequently, let us say too generally, regarded the past world as a mere mine for our working. To put it very shortly, indeed, we have copied always, and copied everything. But to blame the “Victorian” age for this is no less unreasonable in Mr. SEDDING than it has been in anyone of his many precursors in the delivery of the same unthinking message. This is an age of much learning. It will perhaps be followed by an age of fruition; let us hope it will; but, so far as architecture is concerned, we do not seem to have exhausted yet by any means the stores of past study and

practice, by the use of which it becomes the accidental function of nineteenth-century men—who cannot help themselves, be they ever so indignant against Providence—to prepare the way for better times. It is not the will-o'-the-wisp of transcendentalism that will aid us in discovering the road that lies before us. The mere glamour of “word-painting,” the piquant trickiness of mystified phrases, is by-play, not business. What the architects of the coming race have to do is to work as the architects of the past worked, in the honest use of new materials, new purposes, new scientific practices, new associations of ideas, out of which to produce new graces and new art.

THE APOLLO BELVEDERE AND APOLLO THE ATHLETE: LAST WORDS OF A CONTROVERSY.

BY W. WATKISS LLOYD.

IT will be within the memory of the readers of *The Architect* that I had the opportunity some time since to put forward in its columns certain interpretations of two statues of APOLLO. So far as any public renunciation is concerned, the theories which it was my object to controvert may probably be assumed to be still held with unshaken pertinacity. That the subject is reverted to is due, as will be seen, to acquisition of new evidence.

These statues are of the same god, but are typical of two most contrasted developments of art: each is perhaps the noblest example of the style to which it affiliates. The CHOISEUL-GOUFFIER *Apollo* of the British Museum is a type which belongs to the first stage of perfect refinement, proportion, and finish in Greek ideal sculpture. The *Apollo Belvedere* touches, but, as I hold, does not overpass, the extreme limit to which refinement could advance with safety without compromising dignity and force.

As regards the *Apollo Belvedere*, my argument was directed against the theory which would deprive the bowyer god of his proper weapon, and would substitute for it the ægis of his father ZEUS, even at the cost of exhibiting the son of LATONA as left-handed. My principal, though not sole, concern with the other statue was to vindicate its claim to be considered a statue of APOLLO at all. What success my arguments may have had on the prepossessed it is not easy to guess. I am by no means minded to admit that the arguments held conclusive before are now, or have been, in want of further confirmation. But when such confirmation spontaneously accrues it is not to be left unrecorded, especially when by another coincidence it has happened that novel illustrations of the advocated characteristics of both statues have come up within a few days of each other.

I will deal first with the *Apollo* of the Vatican, “the lord of the unerring bow, the god of life and poetry and light,” of Lord BYRON. It was as long ago as 1860 that the heresy was first propounded which has flourished for above a score of years, and which experience and analogy make it too probable will be far from thoroughly extirpated for many a score of years to come. It was in that year that M. STEPHANI, in a brochure entitled “*Apollo Boedromios*,” published an account of the STROGANOFF bronze statuette. He established conclusively that it had such agreement with the marble statue of the Vatican as compelled the inference that one was a copy of the other, or else derived more or less directly from the same original. The agreements in attitude, forms, and even details of sandals, made thus much certain. But the left hand of the marble is a restoration, while that of the bronze is perfect, and grasps something which, whatever else it may be, assuredly is not a bow. It was in consequence assumed by M. STEPHANI to be not merely a fair but an inevitable inference that the left hand of the *Apollo Belvedere* could not have held the bow which had previously been assigned to it without a challenge. A conclusion so positive left out of sight the known licence which ancient copyists assumed of varying details, and even motives. It was propounded in disregard of the inconsistency of leaving a god who had a quiver at his back unprovided with a bow, in disregard of the propriety of his gesture as holding a bow, and of the further propriety of his being exhibited with the bow as his most characteristic symbol when associated with a companion-statue of his twin-sister, the *Artemis* of the Louvre, who is in the act of preparing to shoot. The support which the novel theory obtained was of such weight of authority as to overbear all such considerations. Professor WELCKER hailed it as having happily recovered,

beyond all doubt and all necessity for further discussion, the true significance of one of the best known and most admired works of art in the world. In most unqualified agreement with PRELLER, he was ready to recognise the statue as “most probably” the original of one which the Delphians “most probably” dedicated about 269 B.C., on the occasion of owing their rescue, when threatened by BRENNUS and his Gauls, to the intervention of a supernatural storm. They “most probably,” he considered, ascribed this deliverance to the agency of APOLLO, who repulsed the barbarians by shaking before them the ægis of ZEUS, even as HOMER represents him in the ‘*Iliad*’ carrying dismay among the ranks of the Greeks, and most probably recognised the service in the design and dedication of this statue. The god seemed to the veteran archæologist to be still exposing the ægis to the Gauls, as he moved away in the direction of the spectator, who was thus happily screened from the petrifying or terrifying gorgon. The interpretation approaches the grotesque as we go on. The Professor expressed himself charmed by an observation of OTTO JAHN, that the air of triumphant scorn in the countenance of APOLLO is in perfect harmony with the physiognomical expression of the customary MEDUSA’s head in the ægis. “As to the attitude of the statue, this has been found to indicate a curious triplicity of motive. The god, after facing the direct line of the enemy, it is ingeniously imagined, has just completed the discomfiture of their right wing, and is at the very moment of turning to complete their confusion by the presentation of the dreadful ægis to their left. Even those German critics and archæologists who could not bring themselves to accept the ægis would not revert to the discarded bow. With KEKULÉ and others the opinion found favour that it was not the goat skin with the gorgon’s head attached which the graceful god is holding, but that warning to all presumptuous emulators of poetic supremacy, the skin of the flayed MARSYAS. The MARSYAS theory obtained but few and faint adherents on the continent, and, so far as I am aware, none at all in England. OTTO JAHN was as positive as WELCKER* in declaring that the true attribute was the ægis; that the recognition of this fact was the noblest extension of archæological science; that the matter was one which required and admitted of no further debate. That the ægis is never associated with APOLLO in any of the multitudinous representations of the divinity that have come down to us, and that no representation of an ægis otherwise associated could be produced that would fall happily into composition when grasped and pendant as was supposed, were difficulties not even adverted to. Why the statuette must give law to the statue was as little explained. Why the bronze figure which carried no quiver should forbid us to regard as an archer in action a figure which is equipped with a quiver and an open quiver, and of which the cloak is returned over the left arm as customary with archers in ancient art—apparently to protect it from the released bowstring—was as little made the subject of notice or argument.

For two-and-twenty years the appreciation of the beauty and expression of the *Apollo Belvedere* has been disturbed by this criticism. Yet it is even so long ago that Professor GERHARD gave warning that it would be well to suspend judgment until the primary evidence had been subjected to further examination. Not too soon this has been done, and the result is before us in a paper by A. FURTWÄNGLER, in the *Archäologische Zeitung* for 1882, p. 108. He has submitted the so-called STROGANOFF statuette, which is at St. Petersburg, to a minute and conscientious examination, and finds that the STEPHANI theory of restoration involves an impossibility. What the left hand of the figure grasps has no mark whatever to indicate it as hide or skin—no such marks as bronze especially offers opportunity for, when a hairy surface is to be suggested. The hand, again, is not clenched upon what it holds, but holds it loosely; and what it holds is drapery unimpeachable. In fact, a fold of the chlamys or cloak at the back, which is discontinuous, has manifestly been broken off on its way up to the hand; the hand, therefore, was merely and simply holding the corner of the cloak, precisely as we see a bunch of drapery in a bronze hand in the British Museum.

Is it to be too sanguine to hope that the theory of the ægis has been thus finally, if tardily, disposed of? Possibly not. An example goes far to prove that it is even yet premature to expect that the god of the far-glancing shafts will be allowed to resume his bow without protest, while one alternative, however

* *Archäol. Zeitung*, 1861, p. 212*; 1862, p. 31; 1863, p. 66.

desperate, is unexhausted. GESKEL, SALOMAN (Stockholm, 1882), who repudiates the ægis for the STROGANOFF *Apollo*, is of opinion that what the sun-god holds may be his pocket-handkerchief (*mappa* or *cheiromaktron*)! Whatever acceptance may await this odd suggestion, it would be rash to count upon the universal rejection of another which in itself is not an unworthy pendant—that the *Apollo Belvedere* is one figure of the group of the struggle for the tripod by DRYLLUS and AMYCLEUS (Pausanias, x. 13, 7).

My own views as to the motive and expression of this statue, and as to its relation to the *Diana* of the Louvre, and how it is to be conceived as composed or collocated with it, have been already fully set forth in pages of *The Architect*, to which I take the liberty to refer.

If any controversy is to be considered as still surviving as to the CHOISEUL-GOUFFIER statue of the British Museum being an *Apollo*, an opportunity has occurred, I think, of placing this equally at rest. Mr. WALDSTEIN, who claimed it for a simple athlete (as an athlete CLARAC catalogues the replica in the Capitol), found confirmation in the strap which is carved on the stump that helps the stability of the statue; he interpreted it as pertaining to the cestus of a pugilist. Even so, as I showed by authority, the statue might nevertheless be *Apollo*; but in truth, I believe there can be little doubt that this narrow band represents the end of the suspending strap of a quiver, which, as in several other examples of statues of the nude *Apollo*, was hung upon the stump near his leg; and marks of two points of attachment show where the quiver has been broken away.

Such is precisely the position and management of a quiver which is attached to the supporting stump of an interesting statue of *Apollo* that has within these few weeks passed under the hammer at CHRISTIE'S. That it has passed into a worthy private collection is matter of congratulation, considering the interest which attaches to it on several accounts. The scale of the figure, which is entirely nude, is about life size. It has been recomposed out of an infinite number of pieces into which it must have been broken by some very peculiar catastrophe, which spared some parts as remarkably as it shattered others. The entire body, back and front, as it was seen in the sale room, appeared seamed with joinings like a dissected map. The signs were manifest that laborious and conscientious plugging and clamping and mortising had been employed to make the most of the smallest original fragments, with an expenditure of cost and labour far in excess of what would have been involved in supplying whole surfaces anew. The statue is one that does not at the first glance assert itself as an *Apollo*. Still less is the general type of the figure athletic. Yet at the first glance I was struck by an appearance that the sculptor, in executing the legs and feet at least, must have had those of the athletic *Apollo* very distinctly in his mind if not as a model before his eyes. The temples are bordered by freely curling hair, which divides and rises at the centre of the forehead with a certain suggestion of the *crobylus* of the *Belvedere* statue. But the face has nothing of the energy of manly beauty of that ideal; it verges rather in pathos as in declination to the type of ANTINOUS. The statue, in fact, is an unmistakable replica of that which from the style of its beauty has come to be known as the *Adonis of the Vatican*. VISCONTI even published and commented on this as an *Adonis* in his earlier editions of the "Museo Pio-Clementino." Afterwards he discovered and corrected his mistake. He observed the correspondence of its typical beauty with a statue in the Chigi Palace, and with another in the Giustiniani collection, which retained the attributes of *Apollo*, and for an *Apollo* he thenceforth adopted it. This type of *Apollo* is deserving of far more study and elucidation than can be given to it here, where in fact the only proper excuse for adverting to it at all—apart from its novel and special interest—is dependent on the aid it affords by a subordinate detail to complete the illustration of another statue.

THE VENUS OF MILO.

THE Würzburg. *Allgemeine Med. Zeitung* publishes the following remarks by Professor Krause on the treatise by C. Hasse, Professor of Anatomy at Breslau, upon the discovery he has made with regard to the much-debated position in which the sculptor of the *Venus of Milo* placed her arms. "It is remarkable," writes Krause, "to find in a medical journal an anatomical article on an antique statue, and yet more remarkable is it that a provincial anatomist should contribute so important a revelation to the tercentenary jubilee

of the medical faculty of Würzburg. In truth, the treatise is purely anatomical. The ancient sculptors were so correct in their reproduction of the human figure, that a knowledge of the relatively modern science of anatomy suffices to secure the successful restoration of mutilated statues. Everyone is familiar, if not by having studied the original, at least by casts, with the sublime goddess of the Louvre, to whom arms are wanting. She was discovered in 1820 by the French in the island of Melos, broken in two and thus was brought to Paris. Her divine beauty inspired Heine's poetic genius. During the siege of Paris in 1870 she was buried in a coffin prepared with the utmost care for her reception, and lowered, in presence of the Conservateur des Antiques, into a deep grave dug beneath the cellars of the Louvre, in order to preserve her from becoming the booty of the German conquerors, the Comité de la Défense Nationale rightly considering the *Venus of Milo* as one of the most precious treasures possessed by France; and now it comes to pass that a son of Schleswig-Holstein—as yet, indeed, only in his mind's eye—replaces the arms which for centuries have been severed from the peerless form. Archæologists have put forward various theories on the subject. Some of these were anatomical impossibilities. One learned writer suggested that Venus held an apple in her left hand, given to her by Paris; another that she is contemplating her own beauty in the polished surface of a shield supported on her left knee. The same writer concludes that Mars stood by her side. Dr. Kiel published a monograph in 1882, in which he maintained that *Venus* grasped a monstrous lance with both hands. Not one of these various theories bears the test of scientific examination. Hasse proves that the left arm was raised, and that instead of the closed fingers of the hand discovered near the statue having held an apple, they grasped the coil of hair which falls in a loose knot on the neck, and that with her right hand the goddess pushes downwards the falling garment in the act of sliding from the left hip, *Venus* being about to step forward into her bath. This is the simple and self-evident solution of the thousand-year-old problem. The parallel lines of the eyelids refute the theory of the apple, as well as of the mirror-shield. *Venus* is looking straight before her over to the water in which she is preparing to bathe. There can be no question that the sculptor worked from the life; the *modèle* of the lower figure proves the model to have been a fully-formed woman and not a young girl." Dr. Krause, in conclusion, gave his fullest adhesion on scientific grounds to the discovery made by his younger colleague, remarking that it is manifest that the study of anatomy alone could lead to an irrefutable answer to the question of the position in which were the arms of the *Milo Venus*. It appears that a small antique in bronze, cast in the same lines as the *Melos Venus*, exists in Brussels. Professor Hasse, desirous of studying it, applied for permission to see it, which has been refused. There are some students who believe the Hasse theory is obviously correct. From the pressure of the right arm on the breast it is thought probable that the arm crossed the body from right to left in a downward line. There is a trace on the upper fold of the garment the goddess is in the act of pushing off, where the hand touched it. The movement of the left arm upwards to grasp the knot of falling hair is in harmony with the whole line of the statue.

PARIS NOTES.

AT the last sitting of the Académie des Inscriptions et Belles-Lettres, a communication was read from M. Maspero, director of the Boulak Museum at Cairo, relating to the discovery on the site of old Thebes of a Copt church, dating from the fifth century. It appears that in the course of some excavations made by him last year, M. Maspero unearthed at the bottom of a tomb a limestone sarcophagus covered with inscriptions. Circumstances prevented its removal at the time, but in January last the spot was revisited, and while the necessary preparations for moving it were being carried out, the explorer caught sight of a fragment bearing a half-effaced inscription in Coptic. Further researches were commenced and speedily resulted in turning up several pieces of tile-work (*ostraca*), likewise covered with characters. Three days further work sufficed to lay bare the church in question. Access to it is gained by a descending flight of five steps in brick; the floor is paved, and the walls, which are constructed of brick and white plaster, bear numerous inscriptions in several languages. To the left of the steps on entering is a large framed slab of stone, plastered

over and containing in red ink, the brilliancy of which seems unimpaired, what is evidently the conclusion of a sermon in Theban Greek denouncing the Monophysite heresy. On the opposite side are the remains of another slab of similar kind, and other fragments bearing the teaching of Cyril of Alexandria on the nature and attributes of Christ, portions of sermons on the virginity of Mary the mother of our Lord, upon the doctrine of the Trinity, &c.; while the walls of the grotto are almost covered with *proscynèmes* (devout exclamations) in Copt, Greek, and Syriac, addressed to Saint Epiphany, Saint George, and Saint Phœbammon. M. Maspero evidently attaches considerable importance to these discoveries, for he has undertaken to keep the Academy posted up in the results of the further excavations he purposes undertaking in the neighbourhood of the spot.

The Commission of Historical Monuments at its last sitting classified the following edifices as worthy of national preservation:—The Château de Kézouéré (Finistère), built at the commencement of the fifteenth century, and that of Mortier-Crolle (Mayenne), constructed towards the end of same century; a house in the Queen Anne style of architecture at Morlaix (Finistère), containing a very curious staircase; the Tower of Hautefrage (Lot-et-Garonne); the great Cross in the Couchey burial-ground (Côte-d'Or), which dates from the sixteenth century; the Oratory of Bellecroix at Villeneuve-les-Avignon (Gard), which, although in a state of ruin, is especially interesting for its plan and disposition; the façade of the central pavilion and of the tower of the Château de la Tour-d'Aigues (Vaucluse); the Church of St.-Vaast de Longmont (Oise), the steeple of which, erected in the twelfth century, is very remarkable; and the Church of St.-Aignan (Loiret-Cher), which, in spite of the mutilations it has undergone, still presents much interest, and possesses a very fine crypt.

Captain Prudhomme, of the 83rd Regiment of the French army, stationed near Tunis, has discovered, buried in the sand on the beach of the Gulf of Carthage, a splendid piece of mosaic work, measuring about 140 feet, and so well preserved that the designs are easily traceable. It bears three inscriptions in Roman capitals, and on each side a seven-branched candlestick. The designs include figures of birds, lions, and fishes, ornamental scrolls, &c. The general sense of the inscriptions appears to chronicle the construction of a synagogue erected by the Jews resident in the country under the domination of the Romans. Père Delattre, the well-known archæologist of Tunis, the modern Carthage, is now examining this remarkable mosaic, and will doubtless arrive at the exact meaning of the three inscriptions. The outer walls of the building, of which it must have formed part, are entirely destroyed, nothing remaining but the foundations and the pavement, which are buried some three or four feet in the earth. It was erected near the shore, and the sea, which has been gaining ground on this part of the coast, now comes up to within a few feet of the remains.

The election of the jury in the painting section of the coming Salon took place on Saturday last, the 17th inst., when the following forty artists obtained the greatest number of votes:—Bouguereau, 990; Harpignies, 980; Henner, 966; J. P. Laurens, 958; Humbert, 930; Busson, 924; J. Lefebvre, 924; Tony Robert Fleury, 907; Pille, 861; Benjamin Constant, 876; Guillemet, 861; Puvis de Chavannes, 847; Lalanne, 834; De Vuillefroy, 826; Français, 820; Luminais, 819; Butin, 772; Cot, 770; Bonnat, 756; Duez, 732; Hector Leroux, 730; Rapin, 720; Lavielle, 715; Hannoteaux, 710; Protais, 690; Guillaumet, 690; Baudry, 684; Lansyer, 669; Barrias, 656; Boulanger, 643; Feyen-Perrin, 634; Vollon, 634; Dettaille, 621; Bernier, 603; Rolle, 593; Ribot, 585; Cabanel, 560; Maignan, 560; De Neuville, 547; and Van Marck, 504. The next twenty on the list are retained as supernumerary jurors:—Bouvin, 483; Carolus Duran, 474; Gervex, 438; Jules Breton, 423; Bin, 417; Renouf, 416; Gérôme, 412; Yon, 401; Delaunay, 398; Saint-Pierre, 368; Lapostelet, 355; Hébert, 330; Bauverie, 330; Cormon, 321; Jules Dupré, 319; Rozier, 310; Quost, 305; Thermitte, 305; Bastien Lepage, 289; and Cazin, 283. The time for sending in paintings, water-colours, sketches, and drawings expired on Thursday, the 15th inst., and it is found that the number submitted for the jury's approval exceeds by nearly 20 per cent. the *envois* of last year in the same section. Sculptors have until April 10 for the submission of their works, and architectural and engraving exhibits are received between April 2 and 5 inclusive.

The protest against the first Triennial Retrospective Exhibition,

to be opened under Government auspices in September next, is every day receiving fresh signatures, including many from the most eminent painters and sculptors of the country. The document alleges that under the pretext of encouraging national art, this exhibition will in reality deal a most serious blow to the interests of the great majority of French artists, and in support of this view the following reasons are specially given:—(1) The limiting to 800 the number of works received; (2) that the number of exhibits being thus limited, if only an average of three works be admitted from artists of great reputation, the result will be that but 267 French or foreign painters and sculptors will be represented, to the utter exclusion of young artists of promise. Contrary to general expectation it now appears probable that the Government will carry out their project in spite of the bitter feeling it has aroused among a very large section of the artistic world; it is possible, however, that some change may be made in the regulations of the new Salon in order to meet as far as possible the most serious objections that have been advanced.

An exhibition of retrospective Japanese art will be opened next month in the galleries of M. Georges Petit, Rue de Sèze. It is being organised by the proprietors of the *Gazette des Beaux-Arts*, and the proceeds of the exhibition will be handed over to the Museum of Decorative Art, which has been further enriched during the past fortnight with a collection of Bosnian pottery, purchased at the Trieste exhibition by M. Antonin Proust, the ex-Minister of Fine Arts, and presented by him to the Museum.

The monumental statue of Alexandre Dumas the elder, designed by the late Gustave Doré, is now completely executed in bronze, and in a few days will be ready to leave Messrs. Thiebault's foundry. The Municipal Council has just designated the exact spot upon which the statue is to be erected, viz., in the centre of the Place Malesherbes, at the intersection of the Avenue des Villiers and the Boulevard Malesherbes, on a small lawn or garden now surrounded by iron railings, which will be removed after the unveiling of the monument.

The Library of the Ecole des Beaux-Arts has received from the Marquis de Varennes a valuable collection of drawings, by Géricault, illustrating the anatomy of man and of the horse. Another gift lately made to the Library is that of seventy-two drawings presented by M. Taine, of the French Academy. These come from the collection of M. Alexandre Dennelle, the father-in-law of the donor, and are either original sketches by modern masters or studies from the paintings of the Dutch and Italian schools by well-known artists of the present century.

During the past week have been held the two preliminary trials in the competition for this year's Prix de Rome in the architectural section. In the first, the subject of which was a sketch of *Grand Entrance Door to a Ministry of War*, seventy-one competitors took part. Of these the jury selected twenty-three to compete in the second stage, in which they had to execute a design—elevation, ground plan, &c.—for *An Eye Hospital*. As the result of this last trial the following ten were chosen to enter the *loges*:—MM. Redon, Quatesons, Gouvers, Bergon, Zobel, Fontenelle, Devienne, Henri Legrand, N. Maillart, and Defrasse.

The annual Achille Leclère Prize of 1,000 frs. has been awarded to M. Guéret, a pupil of M. André, and an honourable mention to M. Landry, pupil of MM. Moyaux and André.

The restoration of the tapestries belonging to the city of Paris, and destined for the Hôtel de Ville, has been entrusted to Messrs. Légié, who will receive therefor the sum of 52,000 francs. The five pieces of tapestry from the Church of Saint Gervais figure in the contract for 18,000 francs. These, which were executed at the beginning of the seventeenth century in the *ateliers* of the Louvre, after the cartoons of Le Sueur, Philippe de Champaigne, and Sébastien, by the most celebrated *tapissiers* of the age, are believed to be the only tapestries of importance of which only one copy exists. In the Hôtel de Ville a special room will be set aside for the reception of these valuable works of art, to which access will be had only in company of the Conservator of the Furniture, or his chief subordinate.

The Competitive Designs for All Saints' Church, Ipswich, being so numerous, it would be difficult for Mr. Christian to examine them thoroughly in the Town Hall during the few days they are on view. It has been arranged to send the drawings to London to allow of more opportunities for preparing the report.

UNGER'S ETCHINGS OF THE BELVEDERE GALLERY.*

THE last issue of Herr Unger's plates after the masterpieces of the Belvedere Gallery, with context by Dr. von Lutzow, being Parts XVI. and XVII., show the clever etcher still unwearied in that line of interpretative work which is his strength and speciality, to the exclusion of more creative capacity. The faculty exercised by Herr Unger in this species of artistic translation from one branch of art into another is severely taxed in the examples before us; for what manners can be more different than those of Raphael, Rubens, Gaspar Poussin, and Gerard Dow. Perhaps a group of more distinctive styles in pictorial expression and all technical qualities could hardly be found than the styles of these four masters; the singular assimilative power of the etcher is consequently fully exercised. In Part XVI. we have the dashing allegory of the *Four Quarters of the Globe*, rendered by Rubens with his usual audacious freedom in the forms of river gods and women of redundant charms grouped together on the edge of a stream, where cupids play and an alligator rises to show its teeth at a tigress on the bank who is suckling her cubs. The way in which Unger has rendered by tone the varied and decorative colour of this piece, and the freedom of his line in following the Rubens brush, are admirable. The foreground, however, strikes us as rather thin. The next large plate is a *Portrait of a Man*, now ascribed to Lorenzo Lotto, of Treviso, the cotemporary of Palma Vecchio and Titian, and the pupil of Bellini. The picture has at various periods been given to Titian and to Correggio, but the internal evidence points strongly to the present nomenclature; the resemblance in style and handling to the portrait of Lotto by himself in the Doria Palace at Rome is, as Dr. von Lutzow indicates, very powerful proof. The mellow tone, sensitive modelling of hands and face, pencilling of the soft brown hair, and of the fur bordering of the over robe, are traits which the interpreting needle of Unger has followed with responsive care. Perhaps in the drawing of the hands he has a little exaggerated the ease of his outline, a manner which appears to have gained on him: in opposition to the conventional rounding off of form associated with line engraving, he seems inclined to assume an almost defiant "suggestiveness." The third plate in this part, *Sigismunde*, now called *The Repentant Magdalen*, by Furini, is a picture of an unpleasant type, showy in disposition, exaggerated in expression; but it has given Unger an opportunity for his skilful use of large white spaces in the rendering of the flesh. The last illustration, a *Landscape*, introducing the tomb of Cecilia Metella, by Gaspar Poussin, is not an interesting plate, not from fault of the etcher, however, for the imitation of the technique of Poussin is here and there clever enough, but the picture is not a happy example of the Poussinesque composition. Part. XVI. contains the Belvedere Raphael, called the *Madonna im Grünen*; a fine *Portrait*, by Vandyck, once falsely entitled Charles I.; a sketch by Rubens of the *Miracles of St. Francis Xavier*, and *The Physician* of Gerard Dow.

The Raphael Madonna is classed by Dr. von Lutzow with the Belle Jardinière in the Louvre, and the Madonna in the Uffizi Gallery, known as del Cardellino. It was painted for Taddeo Taddei, in Florence, and through gift of a descendant of his family came into the collection of the Austrian Archduke Carl, of Tyrol, passed into the Ambras, and so finally into the "new" Imperial Gallery at Vienna. It belongs to the period of pure outline and tender expression, of symmetric, flowing composition, and simple broad disposition of drapery. Many *pentimenti* are discernible—rather a troublesome fact for the etcher to follow. On the whole, this is the best plate in the issues before us; the exquisite sensitiveness of line, the masterly modelling of the rounded forms of the two children, the Christ and St. John, have called out the higher qualities of Herr Unger's art. He has kept the whole plate beautifully luminous and delicate, and yet managed to preserve both solidity and the somewhat even range of tone possible within fidelity to the simple colour scheme of the picture. The characteristic landscape background of lake and gentle hill reminds one of the country about Thrasymene, which one may imagine to have suggested to Raphael some of those placid scenes which he loves in his earlier work to bring into concord with the pensive sweetness of the *Santa Famiglia*.

The Gerard Dow gives capital scope for more elaborate management of the etcher's means. The physician, who stands behind a carved window-sill, over which is thrown a rich carpet, holds up a flask to the light, and behind him, in the shadow, is a woman wiping her eyes, in anxious expectation of his dictum. There is skilful and various play of light throughout the picture, study of texture, and much detail, managed with the tasteful completeness and assured handling of one of the most refined masters in a school where refinement was not the quality most sought after. In all this elaborate matter Herr Unger has been happily at home, and this plate is a good example of his versatile interpretation.

HINDRANCES.*

BY J. HONEYMAN, F.R.I.B.A.

(Continued from page 182.)

Excessive Competition.

NOW, to a considerable extent excessive competition (and it is only when it is excessive that it is bad) would be modified if a line of demarcation could be drawn by some such means as have just been indicated between those who are entitled to call themselves architects and those who are not. This, however, would only mitigate the evil, which I suppose affects every other profession as well as our own. The worst effects of excessive competition can only be met by us individually forming and adhering to a high standard of professional honour and etiquette, and by strict adherence to the golden rule. In this, the bond of a common fellowship in a great national association, would strengthen us, but otherwise, in our corporate capacity, we can do little more. We have, of course, that outcome of excessive competition to deal with—"competitions" technically so called—a theme I shall not touch upon, except to say that, thanks chiefly to the praiseworthy exertions of Mr. Barry, a considerable improvement in the conditions of recent competitions has been secured, and I trust in all important competitions will be retained. Competitions must be classed among our hindrances. I think this much must be conceded, even if we differ from Mr. Barry as to the expediency of double competitions. I understand that you are almost unanimously against that arrangement, and I know that many Glasgow architects are also opposed to it—and, as the discussion at the Institute has not yet closed, I think the more fully we can get at the general sense of the profession on this important point the better. It would, I think, be easy to show that competitions are detrimental to our profession, though often beneficial to individuals; and while we should together try to mitigate their evil effects, there will always, I fear, remain only one safe course for those who are fully sensible of their danger, and that is to have nothing to do with them. I read somewhere lately of a very simple kind of trap used by a savage tribe for catching monkeys. It consists of a gourd or coconut shell, having a hole cut in it just large enough to admit a monkey's hand, if I may so speak. A few nuts are put into the shell, which is then fixed securely in a tree, and the trap is complete. Now these nuts are very tempting, and there seems to be no reason why the monkeys should not help themselves to them, and in point of fact they do so; and little monkeys out on their first foraging expedition probably do so with impunity, and are all the better of their nuts. But the object of the natives is not to feed young monkeys, but to feed upon old ones, and these they actually catch in large numbers, because it so happens that they have pretty accurately gauged the mental capacity of the monkey as well as the power of the nutty temptation; hence the simplicity of the contrivance. The monkeys catch themselves, in short, in this wise—in this foolish wise—inserting their hands and seizing the nuts they can't get them out again, and as they have not the sense to drop the nuts they fall into the hands of their enemies and are miserably slain. There is wisdom in this parable; moreover, it suggests this deep and difficult question, is the unhappy fate of such creatures the result of greed or stupidity? It is clear that they might withdraw their hands as easily as they inserted them if only they dropped the nuts. Why did they not do so? that is the question. The traps are fatal to grown-up monkeys, but if they did not choose to catch themselves no such traps would be set.

There is another kind of competition which we may fairly grumble at and do what we can to prevent. I refer to the competition of salaried town officials—city architects, burgh surveyors, and the like, who are paid from rates. In the case of all large cities the corporation has constantly need of the advice of a skilful architect, but it is never necessary that he should be employed to design new buildings—still less that he should engage in private practice—and there is a double injustice in his doing so: there is injustice to the ratepayers who might for such purposes have better advice; and there is injustice to ordinary practitioners who are deprived of work by one whom they are obliged to pay, and whose draughtsman they are obliged to pay, and who is in fact to a certain extent their servant. It must never be forgotten that such functionaries are not selected for artistic ability. It is not because they can produce a good architectural design that they gain their place, but for very different qualifications or reasons. Indeed, a man may be a most excellent town surveyor although quite unable to design a respectable tavern, and yet we find corporations in their ignorance intrusting to such a one works of great magnitude, to the manifest injury and discredit of the profession. Of course I do not mean to say that there is anything to prevent a city architect being at once an efficient surveyor and a first-rate designer, but in fact we find that men of the highest artistic power do not seek such appointments. Perhaps in Leeds you may have an example to the contrary, so—excepting Leeds—I shall venture to say that

* Die K. K. Gemälde-Gallerie in Wien. Radirungen von W. Unger. Text von Carl von Lutzow. Wien: H. O. Miethke.

* A paper read at a meeting of the Leeds Architectural Society, March 6.

there is probably not an important town in the kingdom in which the town surveyor can by any stretch of courtesy be called the ablest architect in the place. It is therefore evident that the practice of which I complain is injurious not merely to our business and our art, but also to the interests of the ratepayers generally.

Want of Unity.

The last hindrance affecting our profession to which I shall advert, and that briefly, is our want of unity. With us as with every other body, "Union is strength," and with strength we have respect; whereas with division, isolation, dilution of energy we have disrespect and contempt. Now, of late years it must be admitted that the architects of England and Scotland, if not of Ireland, have shown in many ways their desire to cultivate more friendly relations with each other, and to act together in matters affecting the general welfare of the profession. What has been accomplished in this way will, I trust, encourage us to do more in the same direction, for much more remains to be done. With all deference, and merely as a suggestion for future discussion, I shall venture to describe the kind of professional organisation which appears to me both desirable and practicable.

First, in every important town there should be an Architectural Society. It is not necessary that a society should be large in order to do good work. A society composed of a clever and energetic president and secretary might give as good advice in matters of general interest as one with a hundred members. Nor is it necessary for a society, in order to perform its proper function as a recognisable organ of the body, that it should meet frequently or at all for the reading of papers. This, no doubt, is a useful exercise, but its usefulness is for the most part confined to narrow limits, and for the purpose we are specially considering it is unnecessary. What we do want is a complete all-embracing circuit, so to speak, sensitive to professional energy, and able to transmit and concentrate the counsel and the sympathies of each widely separated unit. To my mind it is not enough that if any "burning question" arises you should be able to get at the mind of your brethren in Birmingham, or Manchester, or Glasgow, or other towns where flourishing societies exist; not less interesting, perhaps not less important, would it be to hear what those in Winchester or Cardiff, Aberdeen or Dundee, had to say about it; while the mere fact of intercommunication being established would strengthen the bonds of unity. At present there are over sixty towns in which half a dozen or more architects reside, none of which have an architectural society, or anyone to whom an official communication might be addressed. May I express a hope that architects in such towns will give this matter serious consideration.

Secondly, in all this the Institute can do nothing for us, but without the Institute the most perfect scheme of local organisation would be incomplete, and the profession would be deficient in that cohesion so essential to its proper recognition. We must never lose sight of the fact that all our efforts at consolidation must be voluntary. We can never expect to obtain, under any circumstances or conditions, such legal recognition and protection as members of the medical or legal professions enjoy. The art element comes in to prevent anything of the kind, and true genius could compel recognition in spite of all our professional organisations put together. This freedom is good; but while anything like compulsion is out of the question, the man of genius, remembering that architecture is a profession as well as an art, cannot be exonerated if he refuses to recognise common professional obligations.

Now, I take it that the Institute has two distinct functions—one national, the other local. Men in London have in it an admirable local society with large resources and most efficient executive. But looking at it merely as a local society, it is not more necessary, and it would not be more profitable for a Leeds architect to be connected with it than it would be for a London architect to be connected with the Leeds society and to take part in its management; and, indeed, it would not be difficult to show that any interference by us in the purely local function of the Institute would be impolitic even if it were practicable. But altogether apart from this local function, the Institute has a duty to perform for British architects; a national work which cannot be performed by any other body, and our relation to the Institute in this phase of its being is intimate and vital. So much so, indeed, that it is in no respect more important for London architects than for us that the Institute's special work for the profession at large should be properly done; and if we are of opinion that it is not so done our interference is not only justifiable but obligatory. It may be true—I rather think it is—that hitherto the Institute has taken far too narrow a view of its duty to the profession at large, as well as of its own capacity for usefulness. But we—I speak as a provincial architect merely—we, I say, are responsible for its inaction. It is for us, whether members of the Institute or not, to bring matters before it, to make suggestions and definite proposals, to do, in short, what your respected president so ably and earnestly recommended in his opening address last session, and thereby at once evince our interest in these affairs, and give the best assurance of our co-operation; for without that any steps in the direction indicated would be utterly futile. Now, while fully

acknowledging the liberty of all, as already indicated, I go the length of contending for this and nothing less, that every man practising as an architect should be connected with the Institute either as the holder of a certificate of proficiency or as a member. I am quite prepared to hear it said that there is no hope of such a state of matters ever existing, that it is indeed utterly absurd to imagine even such a possibility; and I am quite prepared to acknowledge the absurdity and folly of it if the architects of the country don't wish it; but if the architects of the country believe as I do, that such a change would benefit the profession and elevate it to a position which it has never reached in the past, and certainly cannot claim at present—if they believe this, and wish the change, and act in concert to get it—there is nothing to prevent them getting it, and that speedily. There is nothing in the constitution of the Institute to prevent the modification of the by-laws necessary to bring about such a change; and I am quite sure that the earnest wish of those at the head of its affairs is to do whatever may be thought most conducive to the best interests of the profession, in the remotest corners of the provinces as well as in the metropolis.

Art.

But, gentlemen, I fear by this time you have come to the same conclusion as myself, that my subject with the short title is really too large for the limits of one paper; and I almost hesitate to say a word about the last, and by no means the least interesting division of it, which I have already named—Hindrances affecting our Art. I must, indeed, confine myself to one small branch of the subject; I must not even refer to such obvious hindrances as the pernicious influence of fashion—rather a tempting theme; the exigencies of the times we live in, which cannot be ignored; the commercial spirit of the age; the mechanical ingenuity; the very facilities we have for getting work speedily and economically done, especially by the substitution of machinery for manual labour. We have heard much about these things, and I cannot help thinking that a good deal that we have heard has been the language of impractical hyperbole. But architecture more than any other is a popular art; more than any other it indicates a people's capacity for artistic insight and culture, and seals the record of art's influence on the national mind; and, keeping this in view, I think you will agree with me that there is one hindrance to the progress of our art which has hardly received the notice it deserves, namely, the bad effect of every hideous building that is erected. The educative influence of a badly-designed building in which all taste and propriety is outraged is probably quite as great as that of a building of artistic excellence; and, if our art is making progress at all, we have a right to this consolation at least, that the villanous designs are in a minority. But, still, it is a minority so large and so clamorous as to prove eminently obstructive. Now, the reduction of this minority to reasonable limits so that it shall become comparatively harmless is a work to which architects can only contribute indirectly, and to a much less extent than might on a superficial view of the case be supposed. I utterly repudiate the idea that the architects of the country are responsible for the monstrosities which shock artistic sensibilities in almost every important town. The responsibility lies with those outside of the profession altogether, and we can do little more in the matter than direct attention to the evil and its cause, and so endeavour to overcome it by means of enlightened public opinion. The assertion that our profession is not to blame for the miserable architectural failures which are so common, is entirely at variance with commonly-received and very commonly-expressed opinions; but the fact is simply this, that the public do not employ the best architects to do their work, and with them rests the blame. In some towns they ask their town surveyor to do it, however incompetent he may be, merely because he is their town surveyor; experienced architects are deliberately passed over, and the public get what they deserve to get. In others, and indeed everywhere, the designer of almost every building of any importance is selected by competition, and again, the more experienced architects refusing to compete, the work is handed over too often to beginners. I do not refer here specially to competitions of the first magnitude, but to those for buildings costing say from 5,000*l.* upwards—churches, clubs, schools, blocks of offices, libraries, art galleries, and the like—the buildings by which the condition of our art is mostly judged. For the designing of these, the ablest artists are not selected; on the contrary, as I have just said, they are practically prevented from having anything to do with such works. It is extremely difficult to convince the public that they are the losers by this. One committee does not gain wisdom from another's experience, but gathers it—very often sadly—from its own. Of course, such competitions are excellent things for the younger members of the profession, and sometimes their results are altogether satisfactory; but more frequently, as might be expected, it is the reverse, and our art is thereby hindered, and undeservedly brought into ridicule. Now, observe, to lay the blame of this upon our profession, to judge our art by the outcome of such a mode of selection, conducted by such selectors, is as utterly unjustifiable and absurd as it would be to judge of English painting by the "pot-boiler" of a nameless artist, while the works of a Millais or a Leighton were ignored. If you wish a good painting—a fair specimen of the

English school—you must go to a good artist and pay him a good price for his work. If you prefer buying something you can get for 1/2 the superficial foot, admire it and enjoy it as much as you choose, but don't insult the artists of the country, and at the same time proclaim your own egregious folly by holding it up as a typical example of the art of the day. And so precisely it is with architecture. You may go to Mr. A. and get him to design a church for you, although he has never done such a thing before, instead of to Mr. B., who, as you are aware, has spent a lifetime in the enthusiastic pursuit of his art. That is your affair, we architects cannot prevent you doing as you choose, but we can and ought to protest against you or anyone else referring to Mr. A.'s deformity as a typical example of British architecture. It is clearly not Mr. B.'s fault if the result gives the enemy occasion to blaspheme; nor can we hope to see anything done towards diminishing the output of bad work and encouraging the growth of architectural art until the public entirely change their attitude towards us, and learn to treat our art and our profession as they treat other arts and other professions, giving due deference to the master, and acknowledging the worth of experience. When that is done, when our vestries and town councils and committees learn—as, for the most part, our gentry have learnt—that culture and experience are precious, then, and not till then, may we hope for progress, or acknowledge our fault if there is none. Meantime we are helpless; a Beckett is confounded with a Street or a Waterhouse, and art critics whom we might hope to aid us, serve but to darken counsel by words without wisdom; lacking the discrimination to perceive that our art, for the most part, is misrepresented and caricatured by the obtrusive productions of enterprising novices. Now, you will not misunderstand me so far as to imagine that I give no successful competitors credit for artistic ability. In Leeds you have abundant evidence that sometimes they have abilities of the very highest order; and the point I wish to enforce is simply this, that the talented successful competitor, if he continues in the practice of his profession for twenty years after his first success, will be a greater artist then and a more valuable adviser; and being conscious of that he will reasonably expect more consideration, and will refuse to rush into the ever-recurring competition scramble, to be treated by an ignorant public as if he were exactly on the same level as his youngest draughtsman. I say, the artist who knows his power and his proper place, will not submit to that, and he is passed by, to the manifest injury of our art. Competitions then, by bringing into prominence the crude productions of immature artists, are a serious hindrance to the progress of our art. They are doubtless good things for the immature artists; it may even be contended with some plausibility that they are beneficial to our profession as a business—a means of earning a living—but it seems to me to be beyond question that their influence upon our art is wholly pernicious. As in the past, so still—art's epochs culminate in the achievements of veterans. But veterans with all their dear bought worth can serve us little if we leave them standing idly in the ranks till, one by one, they drop, their life's noblest work still undone, and the veil drawn for ever alike on the unfulfilled promise of the past and the possibilities of the future.

LEEDS ARCHITECTURAL SOCIETY.

A MEETING of this Society was held on Monday evening Mr. J. B. Fraser, president, in the chair. A paper was read by Mr. W. H. Thorpe, of Leeds, entitled "Recollections of Flemish Architecture." Mr. Thorpe dwelt more upon the ancient domestic architecture of the cities visited than the churches and ecclesiastical buildings, and first called attention to Bruges. Its buildings were Gothic in character as compared with Ghent and Antwerp, whose prosperity was rather of a more recent date. The buildings of greatest interest were the Belfry and Halles, and the churches of St. Sauveur and Nôtre Dame. Ypres was remarkable for its Old Cloth Hall, which had an unbroken façade 436 feet in length, with no recessed portions or projecting gables to give light and shade, and so to relieve the monotony of effect. The wall surface was enriched with good Gothic windows and an elaborate parapet. The most pleasing portions of the building were the fine *jourelles* at each end, and the splendid belfry tower, which had afforded a *motif* of design to more than one modern architect. Abutting on the Cloth Hall was a fine specimen of an early Renaissance building, the design of Jan Sporeman, 1575. This building might be taken as a typical example of early Flemish Renaissance, a style of work which was commonly known in England as "Queen Anne," a name that had even been adopted by architects. This name was a gross error, as the style was common 150 years before the reign of that Queen. The principal object of interest in Oudenarde were the Hôtel de Ville and the church of Nôtre Dame de Pamèle. The Town Hall was considered one of the handsomest buildings in the Netherlands, being built in a florid and Flamboyant style. Passing from Ypres, Mr. Thorpe referred to Ghent and its architectural features. The most important buildings in Antwerp were the cathedral, which contained several of Rubens's masterpieces, and the church of St. Paul, chiefly noted for its calvary and its fine old carved oak

confessionals. The Hôtel de Ville, the design of Corneille de Vriendt, was a fine specimen of earlier Renaissance work. This building was adorned with frescoes representing national historic events, the work of Baron Leys. A short description of the Steen, once the city gaol, but now a museum of antiquities, and the Plantin Museum brought a very interesting paper to a conclusion.

ST. MARK'S, VENICE.

["You must understand that the Minister for Public Education will never approve of repairs which involve alterations such as you apprehend in ancient work, as for example in the last arcade to the right, looking towards the Basilica of St. Mark, and will no longer permit the action of those persons who, to make work, destroyed like Vandals that which might have been preserved for future ages, neither will he approve of that fictitious restoration of which you justly complain. Upon this you may rely, and the more so as the Minister has already given evidence of his disposition with regard to St. Mark's, when he caused the works to be suspended so soon as he was in a position to exercise jurisdiction over them, and this was done before the remonstrance from foreign artists with regard to the injury inflicted upon that famous cathedral had reached him."—Reply of the Prefect of Venice, dated September 12, 1882, to a memorial by Italian and foreign artists with regard to the so-called restoration of St. Mark, Venice.—See *Architect*, March 10, 1883.]

I WELL remember how, 'twixt day and dark,
By devious ways conducted, first I came
Before the triple portals of St. Mark,
What time the western sky was all aflame.
That glorious front is nothing but a name;
A foe more fell than Attila has rent
The matchless marbles from that monument,
And left the world a heritage of shame.
Naught now remains to tell to future time
Of Dandolo and Venice in her prime.
Accursed be the hand that dared despoil
Of every orbèd Oriental gem
The Adriatic spouse's diadem,
And mocks us with a fiction or a foil.

THE ARCHITECTURAL ASSOCIATION.

THE ninth ordinary meeting of the Association was held on Friday evening, the 16th inst., Mr. E. G. Hayes, president, in the chair. The following gentlemen were elected members:—Messrs. W. Bamber, L. Dennis, W. King, G. McCombie, W. P. Gibbings, G. T. Hellicar, and G. Corderoy.

The next visit, it was announced, would take place on Saturday, the 31st inst., to the Liverpool Street Station Hotel.

Mr. WALTER EMDEN read a paper entitled "Theatres."

A short discussion followed the reading of the paper, and a vote of thanks was, on the proposition of Mr. Trubshawe, awarded to Mr. Emden for his paper. The proceedings then terminated.

THE PRACTICE OF ETCHING.

THE second lecture by Mr. Seymour Haden, F.R.C.S., on the "Practice of Etching" was delivered at the Birmingham and Midland Institute on Monday evening. After describing the implements employed in the three kinds of engraving—namely, dry point, line engraving, and etching, he illustrated, with the aid of a lime-light lantern, the effects produced by each method. He then spoke in detail of the materials used in etching, and the methods of their application, explaining in the course of his remarks the process which he himself has invented and employed for several years past. In the ordinary method, the plate to be etched is coated with varnish, and the lines of the drawing having been drawn through the resinous protection, the plate is immersed in a corrosive solution, which eats away the metal where the lines have been drawn. When the lighter lines are sufficiently bitten-in, the plate is removed, and these light lines are revarnished to protect them from further chemical action, this interruption being required as frequently as there are gradations to be produced in the intensity of the lines. In Mr. Haden's process the varnished plate lies in the solution, and the drawing is made upon it while in this position, the artist commencing with the foreground and heavier lines, and continuing his work without interruption till he finishes with the highest touches. The stronger lines are thus subjected for the longer period to the action of the chemical solution, but from the heaviest to the lightest part of the work there are subtle gradations which it would be impossible to obtain by the older interrupted process. The lecturer also gave some valuable hints to etchers as to the printing from the plates. His explanations were given with great clearness, and were frequently applauded.

The Spring Exhibition of drawings and oil pictures will be opened at Birmingham next week. A selection from the architectural sketches of the late Mr. Allen E. Everitt will be shown.

NOTES AND COMMENTS.

THE Trustees of the British Museum have agreed to recommend the purchase of the Ashburnham Manuscripts: Those among them which are supposed to have been derived from public libraries in France, and are the most ancient in the collection, will be handed over to the French Government on payment of the sum of 24,000*l.* The remainder will be the property of the nation, and will include several manuscripts relating to the early history of literature in Italy. The most fitting place for the Irish manuscripts, which at one time belonged to O'CONNOR, the historian, would be Dublin; but it is believed that the law in some way would prohibit such an arrangement. It is needless to say that, after the abstraction of the French manuscripts, the collection is of less value; and if the Government declined to purchase it the loss would not be great.

At a late meeting in Leicester the Dean of PETERBOROUGH gave some particulars concerning the restoration of his cathedral. Fourteen years ago Sir GILBERT SCOTT was called in, and he foretold that the central tower would before long be in danger. But all the work he recommended then was the securing of the north wall, which was done at the cost of about 6,000*l.* On July 15, 1879, the Dean and Chapter resolved to consult Mr. PEARSON, in order to ascertain whether the central tower was safe. In his report, Mr. PEARSON said he did not consider there was any danger whatever to be apprehended, although the tower was certainly very much disfigured by the cracks which had been there no one knew how long, and were now laid bare by the scraping of the walls. Mr. PEARSON was again employed in June 1882, when he reported that the cracks had increased and the settlement was continuing. It was supposed that the defective foundation had been affected by the wet seasons. The Dean of PETERBOROUGH denies that if Sir GILBERT SCOTT's suggestions had been carried out the cost would have been only 11,500*l.*, instead of 55,000*l.*, which is the estimated outlay.

DR. C. W. SIEMENS, F.R.S., in lecturing at the Institution of Civil Engineers, gave a description of the electric railways with which he is more or less connected. The Lichterfelde line in Berlin has a gauge of 3 feet 3 inches, and is 2,500 yards, or nearly 1½ miles, in length. It has been in operation since May 16, 1881, and has never failed in accomplishing its daily traffic. The line between Portrush and Bush Mills is six miles long. The two rails, which are 3 feet apart, are not insulated from the ground like the Berlin rails, but are joined electrically by means of copper staples, and form the return circuit, the current being conveyed to the car through a T-iron placed upon short standards, and insulated by means of insulate caps. At present power is produced by a steam-engine, but arrangements are in progress for the utilisation of a waterfall by means of turbines. The line is to be extended to Dervock, six miles distant, so as to be brought into communication with some of the Ulster railways. Dr. SIEMENS believes that the electric system of propulsion is sufficiently advanced to be adapted for suburban tramways, elevated lines, and, above all, for lines through tunnels, such as the Metropolitan and District Railways. But he does not advocate its competition with the locomotive on main lines of railway.

A DECISION in the High Court of Justice decides a point which has some interest for people in England when there is a heavy fall of snow. The question that was raised was whether the highway authority of a highway area within the meaning of the Highways and Locomotives Act of 1878 are entitled to recover from the county authority one-half of the expenses incurred by them in the removal of snow from main roads within their highway area in order to make them available for ordinary traffic. In the month of January 1881 the main roads in the Amesbury district were completely blocked with snow and rendered impassable; the guardians thereupon took measures to clear the roads, so that the ordinary traffic could be resumed, and expended a sum of over 150*l.* in necessary works for that purpose. The guardians claimed one-half of the sum expended upon the removal of the snow, alleging that this sum was properly expended in the maintenance of the roads. The county, however, refused to pay, on the ground

that removing snow was merely a temporary work, and could not be considered an act necessary to maintain the road within the meaning of the Act. The Judges decided in favour of the guardians, who have to keep the road available for the use of the public, and where they have necessarily incurred expenses to render the road available for ordinary traffic they are entitled to recover a contribution from the county.

MR. HENRY REID, who died a few days ago at Bexley Heath, was the first authority in this country on the qualities and action of cement. It was under his advice that the elaborate experiments in Portland cement were undertaken by the officers of the Metropolitan Board of Works, which may be said to have worked a revolution in the manufacture of the material. Mr. REID's name when attached to a report on cement was accepted by financial and other authorities as infallible, and immense sums of money have been expended in Great Britain and elsewhere on the strength of his recommendations. Latterly he took great interest in the development of the industrial resources of Ireland, and he was sanguine of producing an Irish cement that was to excel all the English and German cements in the market. Mr. REID's experience extended to the days of the railway mania, and he was largely employed in laying out and superintending railway and other engineering works. He was a clever writer, and occasionally contributed articles to this journal.

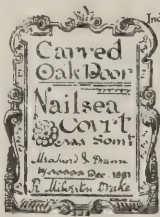

A COURSE of three Cantor Lectures on "The Decorative Treatment of Metal in Architecture," will be delivered by Mr. E. H. BIRCH, A.R.I.B.A., at the Society of Arts, on Mondays April 2, 9, 16. The first lecture will deal with the decorative treatment of the precious metals in ancient architecture, and its occasional use in Egyptian, Assyrian, Babylonian, Medæ, Persian, and Jewish architecture, as well as in Greece and Rome, and during the Christian Dispensation. This will be followed by a reference to the Bronze age; the nature and qualities of bronze; its earliest use in Nineveh, Babylon, Mycenæ, Etruria, and during the classic period. The subject of bronze will be continued in the second lecture, when its history will be carried to the culminating point during the Renaissance. The art of the blacksmith, and the use of wrought iron in the north of Europe will then be referred to. Ironwork will be continued in the third lecture, and an account given of its development at Augsburg and Nuremberg in the fifteenth and sixteenth centuries, and in England in the seventeenth century. The artistic treatment of lead in the Middle Ages will then be considered; and in conclusion the lecturer will make some remarks on the use and abuse of metal work; on modern bronze work; on the decorative treatment of the metals, as applied in these days; and point to our failures and successes. An exhibition of metal work will be arranged in connection with the lectures.

THE new Bill for the amendment of the Patent Laws, which has been introduced by the President of the Board of Trade, possesses many remarkable clauses. It proposes in the first place to dispossess the law officers of their profitable offices, from the Lord Chancellor to the representative of the mysterious Deputy Chaffwax. If the Bill should become law, the control will be transferred from the Court of Chancery to the Board of Trade, and there is to be a Controller-General of Patents, Designs, and Trade Marks. The Patent Office Museum is to be in charge of the Science and Art Department, and it is proposed to publish an illustrated journal of patent inventions. On applying for a patent a provisional specification is to be lodged. It will be referred to an official for a real and not a sham examination, and should the report be favourable, protection for a year will be granted. Nine months after the grant a complete specification is to be lodged, and should there be no successful opposition the patent will be sealed within three months. Every patent is to be for a single invention. The fees in the early stages will be greatly reduced. They will be 1*l.* on application; on granting protection, 3*l.*; at the end of four years there is to be a fee of 50*l.*, and after eight years one of 100*l.* The Post Office is to be utilised for sending applications, &c. The limit of a patent is to be as at present, fourteen years. The Bill is likely to receive opposition, but its provisions would be a great improvement on the existing system.

ILLUSTRATIONS.

NEW BUILDINGS AT CORNER OF LEADENHALL AND GRACECHURCH STREETS, LONDON.

WHEN the illustrations of the new Leadenhall Market were published (*Architect*, January 6, 1883) we gave an abstract of the history of the market and its neighbourhood, which goes back to 1309. According to STOW the manor was, in 1408, confirmed to RICHARD WHITTINGTON and other citizens of London, and in 1411 they confirmed the same to the mayor and commonalty of London, whereby it came to the possession of the city. Leadenhall contained the public granary, and it was used for a place of meeting and for an arsenal. The following description by Mr. LOFTUS BROCK, F.S.A., explains how far the remains which were discovered in the excavations for the buildings illustrated this week elucidate the history of the place :—

The whole of the site of the new buildings was formerly occupied by the ancient Leadenhall, which extended in addition over the site of the recently erected market, while further buildings were to the east. The removal of so large an amount of earth in the excavations resulted in the uncovering of the foundations of a large portion of the old buildings, and the plan of the Leadenhall was in consequence very apparent, and was readily recovered.

It is known from old engravings that the principal front was to Leadenhall Street, where a series of Perpendicular windows under bold arches extended from end to end, there being an entrance archway in the centre and a small turret at each extremity. The interior was an open court, surrounded by buildings of three stories on each side, separated from it by four-centred open arches and buttresses. The chapel, well known to us by the views by WILKINSON and SMITH, was at the south-east extremity. Its site falls just without the area of the present excavations, but it was revealed during the construction of the market. Beyond this, a block of buildings projected to the south now partly occupied by the market. Almost the whole of the buildings of the principal portion had a basement vaulted with a plain, flat, four-centred arch of red brick, much of which was found in a fair condition, while traces remained of other portions which had been demolished with the building on its removal at the end of the last century.

The walls were faced with dressed Kentish rag, the interior being of rag and chalk; the freestone was Caen of very good quality. A great many portions of the plinths, buttress slopes, window tracery, &c., were met with, several being in blocks of considerable size, having been incorporated in the modern buildings recently removed from the site.

These have again been utilised, having been placed in the concrete trenches. The details of the moulded work found agreed so well with what is shown on the old views, that their positions in the building could be assigned with fair accuracy. The site was "made earth" to a great depth, the result of the gradual rising of the ground from Roman times here as over the general area of London. The mediæval builders overcame the difficulty by carrying down through it a series of huge, rough piers, of chalk for the most part. A series of flat pointed arches were formed from pier to pier, the centres being the earth itself cut to the shape of the arch; and on these the superstructure was carried. This system of construction was very usual in London during the mediæval period, whenever a building of unusual weight had to be erected, the difficulty of the great mass of made earth being felt then as now.

Portions of the old building still remain. The east wall of the houses in Bishopsgate Street, from the new market northwards, is one of those of Leadenhall. A row of corbels of the ground floor were intact until recently. One has been carefully preserved, and is visible in the open area between the Metal Exchange and the offices. The south wall of the new market is also to a great extent another wall. Others remain buried. It is of interest to notice that the north-east turret of the new premises is almost exactly on the position of one of those of the old historic building.

Portions of the walls were found to be earlier than others, affording evidence of mediæval buildings of earlier date than that of Leadenhall. Beneath the foundations of mediæval times, Roman walls were found in great numbers. These were connected with the large building partially uncovered during the erection of the market, and were of similar construction, namely, of Kentish ragstone, squared in small-sized blocks to the faces, with bonding courses of bright red tiles at intervals. Unfortunately for observation, the excavations did not go so deep as to the market, and the walls hardly rose above the level reached. They are now buried deep beneath the modern buildings, and who can tell what revolution will cause them to be uncovered? A course of Roman paving of red tesserae, the same as was found in the market, extended over a large portion of the site, and above some of the Roman walls, showing that reconstruction had occurred in these early times. Traces of more than one conflagration were very visible in several portions of the area in layers of burnt ashes and *debris*. One of the Roman walls forms the foundation of the party wall of No. 94

Gracechurch Street, and it extends northwards under the present roadway.

The great pile of buildings which is shown in the illustration is erected upon a site which belongs to the Corporation. In rebuilding, the footway at the corner of Gracechurch Street and Leadenhall Street has been widened and formed into an effective and convenient curve. The yearly ground rent paid by the owners of the buildings amounts to 9,450*l*. The buildings extend along Leadenhall Street to Whittington Avenue, having a frontage to Gracechurch Street of about 250 feet, with an extensive return frontage in Whittington Avenue. It will be seen from the illustration that the ground-floor is arranged to form a series of shops, while the upper floors are offices. The buildings have cost about 70,000*l*., and it is expected that they will produce a rental of about 23,000*l*. The building has also a considerable frontage in Whittington Avenue. Beyond it, adjoining the entrance to the market, are the Metal Exchange and buildings in connection, which have been lately completed on part of the same site.

The contractor for the buildings at the back part of the plot, including the Metal Exchange and offices, was Mr. THOMAS BOYCE, of Eagle Works, Hackney. The contract for the remainder of the site was taken by Mr. W. SHEPHERD, of 101 Bermondsey New Road, who has erected the restaurant, shops, and first-class offices. The whole of the works have been carried out from the designs and under the superintendence of the architects, Messrs. J. & J. S. EDMESTON, 42 Old Broad Street, E.C.

"NORTHSIDE," HILL-LANDS, WARGRAVE-ON-THAMES.

THIS building has been erected in connection with a private college at Wargrave, and consists of students' chambers and tutor's residence, the plan being so arranged that the students are under the convenient supervision of the resident tutor. Other buildings of a similar nature have since been erected, the object being to provide private chambers for a certain number of students under the care of one tutor in each block of buildings.

The walls up to first floor are faced with local red brick, with blue brick plinth. The upper portion is weather-tiled on brickwork, with half-timber framing to central portion and gables, the plaster panels being faced with rough cast. The roof is covered with local brown plain tiles. The building is lighted by gas from a private gasometer.

The work has been executed by Messrs. SILVER & SONS, of Maidenhead, from the designs of and under the superintendence of Mr. W. H. ATKIN BERRY, A.R.I.B.A., of 98 Gower Street, London, W.C.

THE NAG'S HEAD, ENFIELD.

THIS inn, now in course of erection for Messrs. MANN, CROSSMAN, & PAULIN, brewers, is situate at the junction of the Nag's Head Lane with the Market Place, partly on the site of an old public-house, from which it derives its name.

The new buildings form part of the scheme for opening out and improving the approach to the Great Eastern Railway Station, which is at the end of the lane, and consist of the inn facing the Market Place, with spacious public and private bars, and a large and well-lighted billiard-room, lavatory, &c., and a coffee-house fronting the lane, with a private entrance. The materials used are red brick, with Chilmark stone dressings, and green slating to the roofs.

The works are being carried out by Messrs. F. F. & J. WOOD, of Cleveland Street, Mile End, at a contract price of 4,489*l*., from the designs and under the superintendence of Mr. ERNEST SHUM, of 14 Great James Street, Bedford Row, W.C.

DETAILS OF NAILSEA COURT.

THIS sheet of details has been reproduced from a drawing representing careful measurements by Mr. R. MILVERTON DRAKE, of Clevedon.

At a Meeting of the Guardians of the Fordingbridge Union, held on Friday the 9th inst., the plans for the new workhouse prepared by Mr. Fred Bath, A.R.I.B.A., F.S.I., of Crown Chambers, Salisbury, and 342 Strand, London, W.C., were approved.

THEATRES.*

BY WALTER EMDEN.

IN writing a paper on theatres, I propose to give preference to practical results rather than to the many theories advanced, which, although well in their way, are but of little value to an architect who wishes to set about getting out the plans for a new theatre; and in so limited a space the information given must take the form rather of a series of suggestions: to go into full details would be impossible. For this purpose I propose to imagine a site selected, of certain dimensions, and upon this, as it were, build up my suggestions, step by step, and I will divide it into the following sections:—(1) The site; (2) Arrangement, before and behind the curtain; (3) The action of the Lord Chamberlain, magistrates, and Metropolitan Board of Works, as regards the construction of theatres; (4) Fire, and protection from fire behind the curtain. With these divisions I shall try and deal with it so as to render my meaning clear to you.

The Site.

The first difficulty which presents itself in erecting a modern theatre is the choice of a site. The great object to be attained is to find one in a public thoroughfare or off a public thoroughfare thoroughly easy of access to the public. In fact, a theatre in London would be of very little use unless the thoroughfare were a good one, and had both road and rail accommodation of the best and easiest description. It is this reason, I may say, which makes the Strand the best thoroughfare in London for theatres, and however much a theatre in some outlying part might become fashionable, and for a time pay well, outlying theatres generally do not make a good permanently paying investment, and on this, the paying quality in theatres, the whole argument and practical use of such a paper as this must be founded. National theatres, such as those from the times of the Greeks and Romans down to those subsidised by foreign Governments, are entirely in a different category to the theatres of England. Here they are built by private enterprise, entirely without public funds or help, and are looked upon only as an investment of so much money which must return a certain amount of interest. Therefore, in selecting a site, the difficulties of dealing with it in a crowded position—and it is only in such a position a theatre can be built to pay—are these:—The large cost of the land and the ancient lights and rights of the owners surrounding the site, and also the obtaining of proper means of ingress and egress, as, besides the front or main entrance, it is necessary to have side entrances to the stage, and, if possible, to the pit and gallery. Hence the site at the corner of a thoroughfare is best, isolated sites being practically unattainable. All these requirements must be had within a sum which will pay the investor while constructing a theatre that will attract the public. Investors, as a rule, in theatre property require to be paid a much higher rate of interest than would be deemed sufficient on any ordinary house property investment, as the risk is considered to be much greater, and the investors are fewer in number. Therefore the money question must, as I have before said, be made to govern, as it really in practice does, everything. With unlimited space and money the principal difficulties would at once vanish, and everything would be simplified. In the first instance, if the entrance is not in the main thoroughfare care must be taken, in selecting a side street, that the access provided to it be good, in which case a side street off the main thoroughfare becomes almost as good as the main thoroughfare, and, the land being cheaper, pays the investor better. Where some years ago theatres depended for part of their audience upon the passing traffic, now people, as a rule, who lived in town, live outside—all the houses in the centre of the town being too valuable as offices, shops, and warehouses—and so living at a distance from the theatres, people usually make up their minds where they will go before they start; the easier the theatre is of access the better its chance of success. In preparing a site for a theatre the auditorium is usually considered first, because it is taken as the remunerative portion of the house, but from a manager's point of view the accommodation behind the curtain, and the easy working of all the various departments, requires quite as much, if not more, consideration. A theatre in which the working departments are difficult to get at, may involve a very serious item of cost, and when the time of a non-success to the management comes the extra expenses are very sorely felt. Serious attention must be therefore paid to those working portions which do not meet the eye of the public, but which try the pocket of the manager, and thus, though indirectly, considerably influence the letting of theatres. The best proportions for a site are those in which the length is not quite twice the width, and any irregularity of shape there may be of the ground should as far as possible be left to the one side, such reserved portions being most useful for the various accommodations required for lavatories, refreshment-rooms, cloak-rooms, extra staircases, dressing-rooms, &c. For the purposes of my paper I will take the ground as being 100 feet by 63 feet with the necessary side accommodation for stage entrances, &c., and having settled with the adjoining owners

as to their respective lights and other rights, and the plans having been passed, the operations of building may commence.

Before and Behind the Curtain.

In constructing a theatre there are three great points in the auditorium to be kept in mind—easy access, good sight of the stage, and distinct acoustic properties. Behind the curtain there are two points to be kept in view, plenty of space, and accommodation for working and convenient dressing-rooms for the actors and actresses, &c. In the auditorium we will take it that the theatre is to be one of the ordinary form, which seems to be most acceptable to the British public, and at the same time is generally considered most remunerative; that is, a pit, stalls, dress circle, upper circle, and gallery, and a theatre on this site can then be constructed to accommodate, in the—

Pit	450 persons	} Four private boxes on this level, or 616 on ground floor.
Stalls	150 „	
Dress Circle	150 „	
Upper Circle	180 „	
Gallery	600 „	and four private boxes.
In all about 1,700 persons.		

For a theatre of this size I think there should not be more than 18 feet depth in the dress circle, divided into six rows of seats at most, each row occupying 3 feet. The distance from the front of the circle to the front of the proscenium would be about 33 feet, making, with partitions, &c., a total of about 52 feet from the back of the circle to the proscenium. The corridor behind the circle being 8 feet wide, the total distance from the outer wall to the proscenium will be about 60 feet. Thus, after deducting the walls, it leaves 35 feet to the back wall of the stage; adding the projection of the stage beyond the proscenium, its total depth will amount to about 40 feet. The best form I have found for sound is the old horse-shoe; that is to say, a semicircle with the sides produced from it to the proscenium. If desired, some extra accommodation may be acquired to the dress-circle if a row of seats be thrown out forward as a balcony from the general lines of the circles of the house; but every extension over the pit tends to destroy the sound in it. At the sides of the circle, where it joins the proscenium front, it is usual to place private boxes, and this is not only, perhaps, the best position for them, but it is the natural one, inasmuch as it would be impossible in this portion of the theatre to place rows of seats, as only the front row would have a good view, and a large portion of the others would be unable to see at all. The angle which decides where the division between the dress-circle and private boxes should be placed should be governed by the line of vision from the back rows of the dress-circle, for the seats in the circle should not be continued further than the point at which they give a good view of the stage from side to side of the proscenium opening. The width of the proscenium should be 30 feet, the private boxes having a depth of 6 feet. This gives the principal points of the plan. I will next refer to the general points of the section. The height between the different tiers in theatres is greatly varied; but I believe that too great a height is a mistake, not only from the extra cost it incurs, but because the rake of the seats in the various circles, particularly in the top one, or gallery, becomes so extremely steep as, although not perhaps to be absolutely dangerous, still to be very unpleasant to anyone possessed of any degree of nervousness. In the gallery of some theatres when you enter at the top it seems as if the slightest slip would cause you to fall head-foremost into the pit, and however comfortable a theatre is from the dress-circle point of view, it is sometimes in the gallery as if you were on a house-top. Besides which, as regards sound, too great a height helps to create larger open spaces in which portions of the wave of sound created by the actors' voices is lost. Their voices having to be heard all over the house, and every superfluous foot of space absorbing a proportion of sound, the consideration of this point becomes one of importance. Place the ceiling of the pit immediately at the point under the centre of the circle 10 feet from its floor, and from the ceiling of the pit to that of the dress-circle 13 feet, from the ceiling of the dress-circle to that of the upper circle 12 feet, and from the ceiling of the upper circle to the ceiling from which the dome springs above the gallery 13 feet. In the various circles the pitch is calculated roughly thus: each person seated behind the other should be able to see over the head of the person seated in front of him, and all should see from this over the top of the circle front to the footlights in front of the stage, and, if possible, see the orchestra as well. It is usual to make steps in the stalls, circles, and gallery for each row of seats, but in the pit there is a regular rake of the flooring. The height of the stage from the floor of the pit is usually about 4 feet 6 inches, and as the stage should rise from the footlights at the rate of $\frac{1}{4}$ inch in the foot, every one on the floor of the pit obtains a good view with a much less rake than is required for the circles above the stage level. The height of the proscenium from the stage should be more than the width of the opening, which I have taken at 30 feet, say about 35 feet in height, and from the top of the proscenium opening to the ceiling from which the dome springs should be about 8 feet. This last height should always be as low as possible. The dome should be in the form of a flat ellipse; it is best for sound, and avoids as much as possible any too great

* A paper read at a meeting of the Architectural Association on the 16th inst.

height above the proscenium, for where there is too great a height I have always found that distinct sound is very largely destroyed and absorbed, and consequently rendered imperfect. The large amount of air contained in the great height of ceiling acts like blotting-paper on water, and absorbs the sound, or rather draws it off, there being more power of attraction to the sound wave where the air is in the greatest body.

Thus far I have dealt with what, from such experience as I have had, I consider to be the dimensions of the auditorium of a theatre on a site of the size named, and the suggestions here made will meet the requirements of most sites, as they can be proportionately extended or reduced, although, of course, all the dimensions given would not increase in the same ratio in all cases. I believe a thoroughly good result can be obtained from them for both of the two principal essentials required—viz., sight and sound. I do not say for an instant they are the exact or only dimensions on which an auditorium should be built; but I find that theatres of or about these dimensions have produced the desired effect. No doubt there are many valuable theories, and there are many alterations that might add much to the grace and beauty of a building of this kind; but I do not think it possible to discuss them thoroughly in a limited space, and there are many of them which could not be governed by what must govern this paper, and in most cases any theatre, and that is building a theatre to pay. They cannot be simply architectural buildings in the true sense of the words, and the most an architect can do is to produce as well-proportioned and tasteful a building as a limited site and limited capital will admit of. With regard to the question of exits and entrances to the auditorium, I propose to deal with them when I come to the question of protection from fire; but I would suggest that in all cases, when arranging the position of the auditorium, the greatest regard should be had to easy and direct egress and ingress from every portion of the house into the street. The question of men and women's accommodation for every portion of the house should not be forgotten, as, although not perhaps directly affecting the letting of the theatre, comfort in a house adds directly to its popularity with an audience, and so indirectly adds to the profits of the theatre. In all cases the question of seating and good accommodation for the public should be made a primary one, as, although a few seats may be lost, there is no doubt the pleasures of theatre-goers are greatly increased if attention is paid to these points.

The stage should project into the auditorium some few feet, so that when singing or speaking the actor may be more into the body of the house, and his voice thus better heard, and not so immediately affected by the great space in the height behind the scenes. With regard to the stage, the width of the site being 63 feet and the opening of the proscenium 30 feet, there would be on either side, exclusive of walls, a space of about 15 feet, or equal to about half of the proscenium opening; and in a site where the side space is less, it will be found that the difficulty of working the scenery is proportionately increased, and the two proscenium wings which are commonly called "tormentors," inasmuch as they shut out portions of the view of the stage from the audience, having to be pushed forward; so that although the actual opening may be more, the practical gain is nothing, but rather a loss to the house and to the management through the difficulty of working. A stage and the working parts of a theatre badly constructed for accommodation may involve the cost of very many extra hands to the management, and so add an item of cost to the working expenses, which makes a considerable addition to the rent, and is an outlay which shows no return. Of course, depth of stage is very desirable for scenic effect, but it must also be remembered that in theatres of this size the class of performance is seldom such as to require any very large number of people on the stage. The two sides of the stage are known as the "prompt" and "O. P.," the "prompt" side being on the right of the audience, and "O. P." on the left. The "prompt" side derives its name from the fact that it is on this side the prompter has his seat; but in opera-houses and theatres in which operettas are played there is a prompter's box in the centre of the stage, immediately in front of the orchestra, so as to be near the artists. The cellar is in the centre under the stage, and extends over nearly the whole width of the proscenium opening, and over nearly the whole depth of the stage behind the proscenium, so that although the space from the stage to the mezzanine floor is only about 9 feet, the extra depth of cellar should be sufficient to admit of a considerable portion of the scenery, &c., being lowered into it. All round the cellar on the mezzanine floor, under the stage, a clear space is required for working the machinery of the stage, such as traps, slides, &c. There should also be next the proscenium, at each side, staircases down under the stage; these staircases are placed in the spaces created by building the proscenium wall at an angle from the side walls; also at this position come any necessary doors of communication from the stage to the auditorium, all such doors being of iron.

The accommodation behind the curtain should be housekeeper's room, hall-porter's room, management-rooms, wardrobe-room, dressing-room, ballet and supers'-rooms, band-room, store-room for properties, carpenters' shop (which, it should be observed, must not now, as in former times, be placed in the roof of a

theatre), artist's room, and, in a theatre of this size, a bridge for him to paint the scenery from; scene-dock, for stowing scenery in; and lavatories, &c. There is a practice in some cases, for economy in area, in the site, and of money, of placing dressing-rooms in the "flies"; this is not only ill-advised, because it reduces the working space, but it places the dressing-rooms at too great a height and distance from the stage, and the communication from the stage to the "flies" is usually anything but comfortable and easy, and the heat and vitiated air in the "flies" from the gas batterns and floats, &c., which are used, render such dressing-rooms almost unbearable, and certainly most unhealthy, to say nothing of the danger in case of a fire. If possible, the dressing-rooms should be constructed in a building separate from the stage, communicating with it by a single opening only. It would also be an advantage if the various dressing-rooms could be arranged on the prompt side of the stage, with direct and easy communication to the stage and street, and having external lights. This can usually be done, as a house is generally taken in a by-street for the stage entrance, and the rooms over can be used for the above purpose, as well as for the management offices, housekeeper's room, and wardrobe-room. The height of the "flies" should be about 28 feet from the stage for a proscenium of the size mentioned, and it should be arranged as far as possible that these "flies," from which all the "borders" and cloths are hung, and the upper portions of the scenery are worked, be kept as clear of obstruction as possible. There should also be easy communication from the stage on both sides of the proscenium opening to the "flies," they being constantly used during a performance. Under them come the grooves the wings and flats are worked in. The depth below the "flies" of these grooves is regulated by the rake of the stage and height of scenery. The property-room should be upon the stage level; at all events, there should be a room in which a certain amount of properties can be stored for the immediate use of the piece being performed, otherwise a great deal of extra cost in labour is incurred. The supers'-room is mostly under the stage at the sides of the proscenium walls, and should be on the prompt side. This and the ballet or female supers'-room should, if they have no communication with the outside, have ventilating shafts, as large numbers usually dress there. The ballet-room should be on the opposite side of the stage to the supers'-room; both should have water laid on, and distinct accommodation close to them. Under the stage there should be the musicians'-room for them to retire from the orchestra when necessary. This is very desirable in order to keep them together for the time when they may be required for the orchestra, and for them to store their instruments and music in. The green-room is, of course, on the stage level, and as close to the prompter as possible, being usually under the dressing-rooms, at all events near them. The scene dock is simply a space available from the stage wherein to store scenery. It must, according to the new regulations, be so constructed as to be cut off from the stage, as also must all other workshops. There must also be provided a long narrow door or opening through the outer wall of the theatre, enclosing the stage, into the street, through which to bring in or take out scenery. The housekeeper's and hall-porter's rooms should naturally be in the house at the entrance to the stage from the street. The painting bridge in a small theatre is built parallel with the back wall right at the back of the stage, and is supported by a girder running between the two "flies." Against the back wall is a frame on which the scene to be painted is fixed, and which can be raised or lowered, so that the artist on the bridge can get at any portion of the scene on which he is engaged. There should be a small room in the "flies" cut off from them for the private use of the artist, in which his colours, sketches, &c., may be kept in safety. With regard to ventilation, the public, as a rule, have such varied opinions on the subject that it is extremely difficult to satisfy them. One man will think a place hot that another thinks cold; and for the most part people in a theatre expect the atmosphere to be no hotter than it is outside, and often require it to be cooler, forgetting that the natural heat from the bodies of a large number of persons together inside a building must, of itself, keep up a considerable extra heat. It is almost impossible to lay down a fixed rule for the ventilation of buildings of this kind, in which there are so many openings and circles to twist and turn the currents of air. The heat from the people's bodies, and breathing, added to the ill effects on the atmosphere by the burning of large quantities of gas, make it impossible under the present circumstances, where gas is used, to accomplish ventilation with any degree of perfection, although much can be done.

To ventilate a theatre one must draw off the vitiated air, giving access to the fresh in its place. A simple and effective means of ventilation is by small shafts made at the back of each circle, about 4 feet apart, in the ceiling, leading into the roof. Round the sunlight, and at various portions of the domed ceiling, perforations can be made into the same roof space. The heated air, always ascending, passes up the shafts and perforations into the roof, it being the highest point. The heat from the sunlight greatly facilitates the draught to draw it off into the roof from the shafts and perforations, while one large ventilator out of the roof, which ventilator should be above the sunlight, will complete this part for

drawing the heated and vitiated air out of the building. To introduce cool air is now the necessity, otherwise the heated air will, having nothing to fill its place, not have sufficient incentive to go out. Direct communication with the outer air should be made by means of openings and air bricks in the outer walls, at some height above the heads of the public, on each tier, in the dress and upper circles, where there is a corridor outside the circle, small box shafts, tapering as they are carried across to the outer wall, can be arranged. You cannot accomplish the cooling of a building by the chance opening of doors and windows, but a fairly good system of ventilation can be spoiled by such cross currents, and great rushes of air, as is caused by the indiscriminate opening of any aperture in the inconsiderate thinking that an opening must ventilate because a draught is felt. The proscenium walls which part the auditorium from the stage prevent much of the heat created by the gas in and about the stage from passing into the auditorium; but, as a rule, there is very little, if any, ventilation provided over the stage, and, after a time, the heated air having filled the space over the stage and having no exit, find its way into the auditorium; therefore, to prevent this, there should be ventilation through the roof over the stage, besides that over the auditorium, and also some small direct openings for the admission of fresh air. Thus, although it is impossible to construct an invariable system of ventilation for all theatres in the various circumstances under which they are built, by very simple means much can be done to improve it.

(To be continued.)

THE GOVAN SCHOOL ACCIDENT.

AN action to recover 500*l.* damages for damages sustained by the fall of a shed at the Board School, Pollokshields, in March 1882, has been before the Edinburgh Court of Session during the present week.

The shed was 69 feet 7 inches long, between 13 feet and 14 feet broad, and 12 feet 5 inches high from the ground. It was intended to erect the shed in another position, but owing to opposition it was re-erected in its original position. It projected from the wall on the west side, to which the back part of the roof was attached. The front of the roof was supported on a longitudinal wooden beam, resting at the south end on the wall of the school offices there, and at the north end on a stone pillar on a façade fronting Melville Street, and supported intermediately on the top of five cast-iron pillars 8 feet high, placed at equal distances apart. At the back or west side of the shed a wooden wall-plate was partly built into the brick wall there. Between the longitudinal beam and the wall-plate tie-beams were laid, the outer end of each tie-beam being partly dove-tailed into and partly resting on the top of the longitudinal beam immediately above each of the iron pillars in front, and the inner end being attached to the wall on the top of the shed. It is maintained that the construction of this shed was insufficient and insecure. Some of the material was of inferior quality from the first, and some of it had become unfit for use before the re-erection of the shed. Much of the work was improperly executed. In particular, it is alleged that the following defects existed at the date of the fall of the shed. Instead of using Quebec red pine, white pine was used, and at the time of the re-erection, the wall-plate, or part of it, had become unsound and decayed. By means of the tie-beams the structure was designed to be held together, and they should have been securely fastened to the wall-plate at their inner end, and to the longitudinal beam at their outer ends. Provision was made in the architect's plan for having the wall-plate checked into the tie-beams, and fastened securely to them with spikes. It was not so checked, and nails of inferior quality and too few in number were used instead of spikes. The iron pillars were not fastened as they ought to have been to the longitudinal beam. The rafters were not properly secured to the longitudinal beam, the wall-plate, or the ridge board. It was due to these defects that the shed fell.

The following technical evidence was given:—

Mr. D. Barclay, of the firm of H. & D. Barclay, architects, Glasgow, said that his firm had been employed as architects for the Govan School Board. If the shed had been constructed according to the plans prepared by his firm it would have been amply secure. He believed the fall of the shed was entirely owing to the ill-fitting of the dove-tails of the beams to the longitudinal beam. Had they been sufficient the weight of the roof would have tended to make it secure rather than otherwise. The beams did not give way at the wall-plate. The plan showed the tie-beams going into the dove-tail a depth of 5 inches, but it was discovered after the fall that the tie-beams projected into the longitudinal beams a depth of only 2½ inches. From what he had seen he did not think the shed had been re-erected in a tradesmanlike manner. He came to be of opinion that the joiners who erected the shed could not have been tradesmen at all.

In cross-examination, witness said that the plans submitted to the School Board did not indicate the presence of weakness. On the contrary, they showed a building strong in all points. Mr. Andrew acted as clerk of works, and he kept witness's firm advised weekly of the progress of the work. His firm were appointed to

superintend, as architects, and they charged for that accordingly. He did not see anything that was suspicious in the work of the joiners, the Messrs. Reid, in the original erection.

In re-examination, witness said that his firm gave the Reids no instruction as to the re-erection of the shed. He did not consider that his firm were responsible for the re-erection, or that it was under their charge.

Mr. John Albert Rennison, architect, Paisley, said he had visited the scene of the accident on the 22nd, and again on March 24, at the request of the Crown authorities. The pillars supporting the roof were not fixed to the stone foundation. There was no fastening at the top of the longitudinal beam. There was a pitch pine plug in the top of each column, flush with the top. No spike protruded through that plug to the longitudinal beam. The tie-beams were dove-tailed 2½ inches into the longitudinal beam. From what he saw it must have been apparent to any good tradesman that the dove-tailing in the old building had shrunk. The wall-plate was a white pine batten 5 by 2 inches. That was an improper sort of wood for a wall-plate, as it decays rapidly. About one-third of it was decayed. From the condition of this plate, the signs of decay must have been visible in March 1881. A careful tradesman would not have put that plate there. He considered that the fall of the shed was caused by the longitudinal beams not being secured to the top of the column, and the tie-beams not being properly secured. Both should have been fixed to the top of the columns. The fall of the shed must have been gradual. Judging from the state of the other shed, he should say the shed which fell must have shown signs of falling. He did not consider that the shed had been re-erected in a tradesmanlike manner. The defects were gross, and the work such as no efficient tradesman would have put out of his hands.

By the Lord Ordinary—What in your opinion would be the proper mode of attaching this tie-beam to the longitudinal beams connected with the pillars?—A. I would have had the top plate bolted both to the tie-beam and the longitudinal beam, and then neither of them could have given way.

Mr. James Lamb, architect, Paisley, said he had examined the shed on the same date as the previous witness. He considered that the design was not strong, but the workmanship was not altogether proper. The wall-plate was not properly fixed, and the tie-beams were not properly secured to the longitudinal beam. White pine was not a proper material to build into the wall. There was nothing to prevent the roof being forced off the pillars. If the longitudinal beam had been spiked to the plugs in the upright column the structure would have been greatly strengthened. When at the place he examined the other shed, and found that the pillars were slightly off the plumb, and on his reporting to the Fiscal that it was insecure, it was boarded up and afterwards put right.

Cross-examined—With good workmanship, and if the wall-plate had been properly spiked, the roof could not have come down.

Mr. John Gordon, architect, Glasgow, said he attributed the accident to the dove-tailing of the tie-beams to the longitudinal beam being loosely fitted. The wall-plate was different from the plan, in so far as it was not notched into the tie-beams, but simply nailed. The nails here, as well as all over the structure, were deficient in number and defective in quality, being machine-made nails. He did not think the structure would have given way if the dove-tails had been properly secured. Witness then described two experiments which he had conducted to test the bearing weight of the tie-beams. He took a longitudinal beam of the same size as that used in the shed, made a similar dove-tail, and had tie-beams of the same dimensions. The longitudinal beam was sustained on two props, and weights were attached to the tie-beams so as to make the strain upon the dove-tail similar to what had been the case at the shed. The one with a two-inch mortice broke with a weight of 38 cwt., and the other with a mortice of five inches broke with 95 cwt. These were properly-fitting dove-tails, and no spikes were used. The other experiment was tried at the proving-house with this result:—With a two-inch dove-tail the wood was torn away with 25½ cwt., and with a five-inch dove-tail the wood was torn away with 64 cwt.

Cross-examined—The nominal strain on the tie-beams of the shed would be about 8 cwt., so that, looking to the result of the experiments, there was a good margin of safety. He was of opinion that the shed would still have been standing if the design had been properly executed.

Alex. Bruce, mason, said he was contractor for the mason work in taking down and re-erection of the shed. In the course of the operation he noticed that part of the wall built was very much decayed, and he called the attention of the joiner to it; but Reid (the joiner) stated that in his contract he had nothing for new material, and was only paid for the re-erection.

Thomas Richmond, grain merchant, said he lived opposite the school in question. He noticed from his window that the columns were off the plumb. He had no skill in building, and consequently had no idea that this state of affairs was dangerous, and therefore did not give information on the subject.

Lord McLaren remarked that it was a pity that witness had not said something about it.

Witness replied that if he had done so he would have been laughed at, because everybody going along the streets of Glasgow saw hundreds of buildings standing in that way.

John Wright, master joiner, his foreman, and another witness, deposed to having the day before, the accident noticed some of the pillars off the plumb, and they went round to the janitor's house to speak about it; but, being at church, they could find no one about. Going to work the next morning they heard of the accident.

The hearing of the case was adjourned.

GOSPORT TOWN HALL AND PAROCHIAL OFFICES.

A COMPETITION among architects has recently taken place for a memorial hall and offices for local board, guardians, and overseers for the parish of Alverstoke. The professional referee employed was Mr. Benjamin Tabberer, F.R.I.B.A., of 10 Coleman Street, London. The number of competitors was limited to seven, and the designs they sent in were placed in the following order of merit, awards being made to the first four successful competitors, viz.:—First prize, the commission to supervise the erection of the buildings at a remuneration of 5 per cent. upon the money expended, Messrs. Davis & Emanuel, London. Second, 50%, Mr. W. Yeardye, Gosport. Third, 30%, Mr. W. A. H. Ford, Portsmouth. Fourth, 20%, Mr. A. Hudson, Portsmouth. The other competitors were—Mr. Sulman, London; Mr. A. H. Bone, Portsmouth; and Messrs. Rake & Fry, of Portsmouth and Gosport respectively.

Under conditions of competition (which were drawn by Mr. Tabberer after consultation with the committee) the building is to consist of three blocks, viz.:—

Firstly, the central block, comprising the Thorngate Memorial Hall, to be used for public meetings, concerts, and entertainments, with main entrance at west end, and all necessary adjuncts.

Secondly, a block on the north side towards High Street, containing the offices for the Alverstoke Local Board, office for the Trustees of Thorngate's Charity, and Friendly Societies' Office.

Thirdly, a block on the south side, containing the offices for the overseers, guardians of Alverstoke parish, and rooms for resident caretaker.

The total cost is not to exceed the sum of 8,800*l.* The selected design, which is Flemish in character, is proposed to be built in red brick with stone dressings. This design was the only one that strictly complied with the conditions, and among others, possesses the merit that it is not likely to cost more than 8,200*l.* Mr. Tabberer expressed a strong opinion in its favour; and on the committee dividing, it was found that there were ten members in favour of the award being granted to this set, and only one against.

The whole of the drawings were on view at the vestry-room of the House of Industry, at Gosport, on the 12th and 13th inst.

The amount at the disposal of the committee did not justify any extravagant outlay in ornamental detail. Some of the designs submitted would evidently have involved an outlay greater than the money at command, and though superior in external effect to that of the successful competitors, were doubtless placed lower in the competition on account of the additional cost that would be involved by their execution.

The Ipswich Competition.

SIR,—Kindly allow me space for a few words with reference to the article in your paper of last week on the subject of competitions. 1st. I would say that, although I have undoubtedly spoken in favour of them as almost the only means whereby young men of talent could make themselves known, I do not remember ever to have advocated the system of professional adjudication, and certainly never in the sense implied in your article. The one thing I have always strongly insisted on is *honest* competition, and on architects themselves this must almost wholly depend. That the services of a professional referee are valuable, and in some cases absolutely necessary, can hardly be questioned by those who know the exceeding difficulty of the work to be done; and there can, I think, be no doubt whatever that it is earnestly desired by architects themselves that such a referee should in all cases be appointed.

As regards this Ipswich case, you are mistaken in supposing that my name has had anything to do with the great draught of designs which has resulted from the advertisement issued by the committee. The letter requesting me to act as referee was received on February 24, and the plans had to be delivered at Ipswich not later than February 1, though the time was afterwards

extended. Some, I believe, had actually arrived before any communication was addressed to me.

To my mind the response to the invitation is simply appalling. It is no part of my business to inquire as to the funds in hand for building the church, but it is hardly to be supposed that a committee of gentlemen who would advertise for plans had no intention of proceeding with the work, and the instructions to competitors clearly show that it is to be done in sections; but that such an invitation as has been issued should draw forth such a response is enough to make any aspirant for employment quake in his shoes.

Having accepted the office of referee in this case, I shall of course do my best to arrive at a just conclusion, but I cannot say the prospect before me is in any respect alluring.

I am, Sir, yours faithfully,

March 21, 1883.

EWAN CHRISTIAN.

New Lyceum Theatre, Edinburgh.

SIR,—In the notice in your last issue of the proceedings at the Edinburgh Guild Court I am reported to have said, speaking of iron curtains dividing the stage from the auditory, that "Captain Shaw, the chief of the London Fire Brigade, disapproved of them altogether." This is incorrect. What I did say was that the authorities in London had not yet settled definitely what was the best kind of dividing curtain, and that Captain Shaw had recommended a water curtain as an efficient division.

I am, Sir, yours, &c.,

26 Mecklenburgh Square.

CHARLES J. PHIPPS.

The Decoration of St. Paul's.

SIR,—Perhaps you will allow me, before retiring again to rustic oblivion, to add another sentence or two to this correspondence. I should like to say that I agree with "A London Artist" in thinking that the ordinary training of an architect does not qualify him to give "authoritative judgment on questions of colour." So far as my experience goes the majority of architects are not "colourists"; but many are colourists, and are so as truly "by gift of nature" as men who are colourists and nothing else. And, in any case, your correspondent must surely see and acknowledge that in the decoration of a church there are "other things" to be considered besides colour and drawing, of which the architect, even if not a colourist, is almost certain to be a better judge than the colourist who is not also an architect. This, no doubt, is what "F.S.A." means when he speaks of the architect being more likely than the artist to take a sensible view of decoration in "its relation to other things." This proposition, indeed, can hardly be questioned; and, in the case in point, it would almost seem that it is the artists who have had the temerity to rush in where architects fear to tread.

I must endeavour to correct a misapprehension on the part of my London brother. I did not intend to attach so much importance to the faith of the *artist* as he imagines. On this point I agree with him very much; and, indeed, must own his soft impeachment. It was the "*cotemporary belief*" which I had chiefly in my mind. Neither the artist *nor anybody else* believes in the thing represented; and I ask your correspondent candidly to say if he thinks it right to pourtray on the walls of St. Paul's what in all time coming must give a false idea of the nation's present faith—an artistic falsehood, as well as a ridiculous decoration.

My original assertions that such decoration is foolish, and such teaching false, have not been impugned; and if anything else should be said on the subject, I would like to leave the saying of it to "F.S.A.," whose sensible letter shows him to possess qualifications for the task which I am quite conscious of wanting.

I am, your obedient servant,

A COUNTRY ARCHITECT.

LEGAL.

Court of Session, Edinburgh.—March 16.

PHILIP v. SPEED.

LOCAL BUILDING REGULATIONS.

This appeal against the decision of the Dean of Guild in Dundee raised an important question as to the rights of the Dean of Guild to interfere with a proprietor in making internal alterations on his property. The appellant, a joiner, residing in Seagate, Dundee, contemplating certain alterations on his premises in Seagate, submitted plans to the Police Commissioners, who on December 26 last approved of the plans and sections. He did not, however, proceed with the whole alterations, but merely took out some partition-walls and flooring. While doing so the respondent, the Procurator-Fiscal of the town, in the public interest presented a petition to the Dean of Guild asking interdict against Philip proceeding further with his alterations or interfering with any part of the tenement; and, further, that Philip should be fined in the sum of 10*l.* and the expenses of the application. Interim interdict was granted and answers ordered. Philip then said that he had not taken down or interfered with any building or walls so far as

abutting on any street or bounding any conterminous proprietor, and he had no intention of doing so without first obtaining judicial authority. He further maintained that under the Dundee Police Act of 1882 the warrant of the Police Commissioners was sufficient authority to him for what he had done.

The Dean of Guild repelled the defences, declared the interim interdict formerly granted perpetual; fined Philip in the sum of 10*l.*, and found him liable in expenses. In a note he said that the plans and sections showed very extensive alterations on Philip's property, including the rebuilding of the tenement fronting Seagate Street. As the alterations which formed part of the larger scheme sanctioned by the Police Commissioners had been admittedly proceeded with by the respondent without other authority and without warrant from this Court; and as it appeared that a conterminous proprietor sought to raise questions of possessory right or disputed boundaries the Dean granted the prayer of the petition. Philip appealed against this decision, and the case was debated at great length in the First Division.

Their Lordships, following the opinion of the Lord President, gave judgment sustaining the appeal, dismissing the petition, and finding Philip entitled to expenses. His Lordship said he did not see any good ground for presenting this petition, the alterations being within the appellant's right, and not of such a character as to require a warrant from the Dean of Guild or anybody else. If internal alterations were of such a character as to cause danger to the public or to neighbouring proprietors, the Dean of Guild would be justified in interfering to stop them; and if such a case were before the Court His Lordship would be very slow to interfere with the Dean of Guild's jurisdiction. There was not, however, any averment of danger, and this application was not, in the circumstances, justified.

JOHN MAXWELL SHARPE *v.* JAMES GREIG AND OTHERS.

This action was brought to recover 500*l.* damages for alleged breach of contract. The pursuer, a salt manufacturer, Prestonpans, employed Messrs. Thornton Shiels & Thomson, in the beginning of 1880, as his architects for the erection of two villas at Prestonpans; and the other defender, James Greig, was employed to do the joiner work. On the ground that the joiner work had been imperfectly done, and that the architects also had not fulfilled their duties under the contract, this action was raised; and proof in the case was recently heard.

Lord Kinnear gave judgment, holding that the pursuer was entitled to 50*l.* damages as against the defender Greig, but that he had failed to prove anything against the architects, whom, accordingly, His Lordship assuaged from the conclusions of the action, and gave expenses as against the pursuer. The pursuer was found entitled to expenses as against Greig, except in so far as these have been caused by the architects' defence.

NEW BUILDINGS.

Helensburgh.—The plans for the new Town Hall prepared by Mr. John Honeyman, architect, Glasgow, have been placed for exhibition in the Court House. The elevation is generally of the Scottish Baronial style, to harmonise with the present Municipal buildings. The frontage is to Sinclair Street, the ground floor showing entrance and three commodious shops or public offices the hall floor above having niches suitable for statues in place of windows. The hall, which will accommodate about 900, will be entirely lighted from the roof, and a handsome platform, organ-loft, and retiring-rooms are shown in connection with the buildings at present existing. The total cost is estimated at 4,000*l.*, of which it is proposed to borrow 2,500*l.* on security of a penny rate to be imposed for one year. The remaining 1,500*l.* is to be subscribed or guaranteed before proceeding with the building; and it is expected that a bazaar, to be held when the hall is opened, will refund the 2,500*l.* borrowed, while the annual income will more than pay the annual expenditure.

A New Ventilator.—Mr. Arnold W. Kershaw, architect, of Lancaster, has patented a new ventilator, called the "Patent Pneumatic Ventilator," which, judging from its efficiency, simplicity, and cheapness, must soon claim the attention of architects and others interested in scientific ventilation. It consists of three rims of vertical deflectors, with openings in each, arranged *hit and miss*, the effect being that from whatever point the wind strikes it a strong up-current is induced in the central shaft, without any possibility of a down-draught. It is perfectly automatic in its action, and the slightest breeze is sufficient to induce an up-current. Mr. Kershaw's system of ventilation also comprises an Inlet and Air Diffuser, which by an arrangement of radiating plates fixed at the inner upper end of the inlet cuts up and diffuses the incoming current of fresh air, entirely doing away with draughts. Taken together—the Patent Pneumatic Ventilator and the Patent Inlet and Air Diffuser—a perfect system of ventilation is obtained. A modified form of the Pneumatic Ventilator is an efficient cure for smoky chimneys, and is also used as a cheaper soil-pipe ventilator.

CHURCH BUILDING AND RESTORATION.

Flyford Favel.—The foundation-stone in the rebuilding of Flyford Favel Church has been laid. The architect, under whose direction the work is being carried out, is Mr. W. J. Hopkins architect to the Worcester Church Extension Society.

Water Houses.—The Catholic church of Our Lady Queen of Martyrs has been reopened after being rebuilt for the purpose of extension. In its altered state the church now consists of nave, 80 feet in length; the old chancel; tower, 60 feet in height, organ gallery, porch, belfry, and transept. The church will now accommodate 400. Mr. W. Fox, of Durham, was the architect, and Messrs. Robert Robson & Son, of Durham, the sole contractors.

Crowle.—The restoration of the parish church of St. Oswald, Crowle, in the diocese of Lincoln, is to be proceeded with. At a meeting held the week before last the plans prepared some years ago by Mr. A. S. Ellis were formally adopted, and a building committee was appointed. The Norman portions will not be touched. The lintel of the west doorway had previously been the sculptured and inscribed shaft of a "Runic" cross, which had probably stood erect in the garth of an older "stave-kirk," or wooden church, on the same site. The Runic inscription was discovered by the Rev. J. F. Fowler, M.A., F.S.A., of Durham.

SCHOOL BUILDINGS.

South Shields.—The new schools at Laygate Lane have been opened. They are designed upon the class-room system, and will accommodate 762 children. The outlay, which includes caretaker's house, furniture, and heating apparatus, but exclusive of site, amounts to about 4,633*l.* Although the foundation, which passed through an old quarry, had to be built up for nearly 30 feet, the cost has hardly exceeded 6*l.* per seat. These schools are built after the Queen Anne style of architecture, of red Sherburn brick with stone dressings, and owing to their contiguity to the Westoe suburb have brick pilasters, stone strings, and stone pedimented gables. They are covered with the best green Westmoreland slates, and there is a lofty bell-turret on the summit of the roof. The latest improved sanitary appliances have been introduced, including an automatic flushing apparatus for closets and drains. Large covered playgrounds have been provided, and every room has been heated by steam. The contractor was Mr. A. Thompson, and Mr. Lindsay was the clerk of the works. Messrs. Oliver & Leeson were the architects.

GENERAL.

Mr. Alma Tadema, R.A., has been elected president of the Royal Birmingham Society of Artists in succession to Mr. Millais.

The Statue of the late Earl of Beaconsfield, by Signor Raggi, will be unveiled on April 19 by the Marquis of Salisbury.

The Edinburgh Town Council have voted a sum of 1,000 guineas towards the completion of the new University Buildings.

A Church is to be erected in Keighley from the plans of Mr. J. B. Bailey. This will make the fourth church lately erected in the district.

Institute of Painters in Water Colours.—Mr. E. Spencer Stanhope, Mr. E. Abbey, and Mr. Walter Langley have been elected members.

Mr. H. L. Sumner, F.R.I.B.A., on Wednesday, read a paper at the meeting of the Liverpool Architectural Society, entitled "Something about Art."

A new Catholic Church will shortly be commenced at Mossend, Lanarkshire, from the designs of Messrs. Pugin & Pugin, of Westminster and Ramsgate.

An Archaeological Society is to be founded in Manchester for the study of the antiquities of Lancashire and Cheshire. The project has received influential support.

Mr. D. W. Stevenson, A.R.S.A., read a paper entitled "System and no System in Art Education," at the meeting of the Edinburgh Architectural Association on the 21st inst.

The Congress of the Sanitary Institute of Great Britain will be held in Glasgow from September 25 to 29. The Exhibition of Sanitary Apparatus and Appliances in connection with the Congress will remain open until October 20.

Woodbastwick Hall, the seat of Mr. A. Cator, which was destroyed by fire last Christmas, is to be rebuilt from the plans of Messrs. T. D. Barry & Son, architects, of Liverpool. The buildings will cover an area of three-quarters of an acre.

The British Museum has acquired the copy of "Petrarch" which was sold in last November at the sale of the Sutherland library. It contains six fine impressions of the so-called *Triumphs*, which have been attributed to Fra Filippo Lippi.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MARCH 24, 1883.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”

COMPETITIONS OPEN.

ELGIN.—May 31.—Plans and Designs are wanted for Town Hall proposed to be erected. Mr. David Forsyth, Town Clerk, Elgin.

ERON.—April 2.—Designs are required for the Erection of an Ornamental Iron Bridge over the Barnes Pool. Mr. Edwin Aborn, Bridge Master, Eton, Windsor.

MOLD.—May 8.—Plans and Specifications are required for adapting Upper Rooms of Market Hall as Assembly Rooms. Mr. G. E. Trevor Roper, Clerk to the Local Board, Mold.

RIPLEY.—Mar. 30.—Plans are required for the proposed Erection of Two Schools at Lower Hartsbray and Waingroves. Mr. Jno. T. Capon, Clerk to the School Board, Market House Chambers, Ripley.

SPITALFIELDS.—April 7.—Designs, &c., for Iron Roof for Market are required. Mr. R. Rayner, Elder Street, Norton Folgate, E.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—Mar. 26.—For Building a Villa Residence at Smallshaw, Hurst. Messrs. John Eaton & Sons, Architects, Ashton-under-Lyne.

ASHTON-UNDER-LYNE.—Mar. 26.—For Alterations and Additions to Commercial Hotel. Messrs. J. Eaton & Sons, Architects, Ashton-under-Lyne.

AYR.—April 30.—For Building Station Buildings and Hotel. Plans, &c., at the Engineer's Office, St. Enoch's Station, Glasgow.

BATLEY.—April 4.—For Enlargement of Post Office. Mr. Walter Hanstock, Architect, Branch Road, Batley.

BELFAST.—Mar. 27.—For Building Dwelling-houses, Kenbella Avenue. Messrs. Young & Mackenzie, Donegall Square East, Belfast.

BELFAST.—Mar. 29.—For Rebuilding Premises Messrs. Young & Mackenzie, Donegall Square East, Belfast.

CLEVELAND WORKS.

PARIAN CEMENT. NINE ELMS BRAND.

MADE BY THE PECULIAR PATENT PROCESS.

Strongly Recommended, after 30 years' experience, for DAMP WALLS, on a backing of Portland, and as the ONLY SAFE CEMENT, capable of being PAINTED and PAPERED within 24 HOURS.

LARGELY PREFERRED FOR HOSPITAL WALLS & CEILINGS, BEING NON-ABSORBENT & NON-EFFLORESCENT.

TESTIMONIAL.

37 NORFOLK STREET, STRAND, W.C.: April 9, 1880.

DEAR SIR,—The Parian Cement which has been used extensively in St. Thomas's Hospital, and of which a large quantity was supplied by you, has given great satisfaction, and is, I believe, generally acknowledged to be the best material for lining the walls of hospital buildings. Its hard, smooth surface admits of being readily cleaned, which I need hardly say is of great importance.

Messrs. FRANCIS & Co.

I am, Dear Sirs, yours faithfully,

HENRY CURREY, ARCHITECT.

Sole Manufacturers:—FRANCIS AND CO., VAUXHALL, LONDON, S.E.

Price One Shilling. Free by post, carefully rolled, One Shilling and Twopence each.

May be obtained from all Newsagents or Booksellers, or at the

OFFICE OF "THE ARCHITECT," 175 STRAND, LONDON, W.C.

The Architect.

A GRAVE ARCHITECTURAL GRIEVANCE.

ARCHITECTS, like the rest of the world, have to live; and, generally speaking, they have to live by hard work. We may add that they belong to a class of professions in which it is most important that money remuneration should come in a friendly, not an unfriendly, way. The lawyer, for instance, is accustomed to be paid with groans and even execrations; the doctor

knows that his fee is many a time put into its little envelope with a heavy sigh; but the architect ought always to feel that his shilling in the pound is considered to have been profitably bestowed, and that it truly represents the difference between a well-organised structure, the pride of its owner, and a mere pile of materials without form and void. In this view of the case those of our readers who have studied the anomalies of human nature may not be so much surprised as could be wished when we state the fact that, if it pleases a client to be very shabby, the best of architects may find almost more difficulty in getting paid his due than the payment is worth. Nay, we have heard it declared that no client who is in himself sufficiently inaccessible to feelings of honour need ever pay his architect a penny-piece, provided he knows "how not to do it."

In plain language, the agency of an architect is, to the mind of an uninitiated person, so subtle in its nature, and, in the eye of an initiated person on mischief bent, so involved in intricate responsibilities, that there is no end to the repudiations, accusations, counter-claims, and miscellaneous artifices of attack and defence, which a fraudulent customer may be advised to rely upon, as means whereby to resist a just demand for architectural services; indeed, we may almost say there is hardly any restraint imposed upon the amount of exaggeration which it may be deemed expedient to indulge in; and, this being so, we need scarcely go on to say that, when an unfortunate architect finds himself left to the tender mercies of litigation by a client who is avowedly merciless, his troubles are just as many and as great as his adversaries choose to make them, including not merely the loss of money and credit fairly earned, but the sacrifice of other cash and other character to any extent that accident may determine.

But this is not what we refer to under the title of "A grave architectural grievance;" it is vexatious enough in itself, but there is something still more vexatious which arises out of it. Our dishonest customer cannot play his game without allies, and it is indispensably necessary that he should be able to procure the aid of some other architect—probably of three or four other architects—who will show him or his solicitor (for a consideration) "the way not to do it" above referred to. Now dog does not eat dog. Lawyers themselves are very chary of assailing each other. Medical men, with all their disagreements of doctrine, hang together honourably in personal matters. Even rival shopkeepers in back streets know the limits of decent rivalry. How, then, shall anyone proceed who has to induce an architect to betray his brother?

The process adopted is always the same, and it is based upon a very peculiar characteristic of the architectural profession which we must explain. It is well known that architects have to do their work sometimes in the form of what is called *reports*. These reports are somewhat of the nature of counsel's opinions. A statement of facts, either in writing or not, is laid before an architect of presumed experience for his advice. A survey or inspection of the subject of dispute may be involved, as matter of course. Documents also are perhaps formally submitted. The architect thereupon considers the case, as he generally says, "carefully," and delivers an opinion upon it in the form of a "report," which is engrossed on foolscap, sometimes on "brief," in the elegant but severe handwriting of Chancery Lane, and with wide margins, all very stately and impressive, and wearing the aspect of a thing that is worth a handsome fee. The subject may be a builder's extras, the value of an acre of house property, the compensa-

tion claim of a greengrocer, a hundred and fifty competition designs for a church or a town hall, the iconography of a cathedral, the smell of a drain, the quality of a brick wall, the cause of a crack in it, and so on, not excluding a brother architect's charges or a brother architect's mode of transacting his business. Accordingly, when our shabby customer, or his solicitor, requires the aid of an architect, or of three or four architects, to bolster up his case, the trick is to request the favour of a report upon a certain statement, or misstatement, of facts. That is to say, he does not rush into the first architect's office he comes to and claim the protection of the just; neither does he send a brief to some well-known professional authority and retain him to be his advocate in the witness-box; the solicitor blandly intimates that he has a slight architectural misunderstanding on hand, respecting which he would be glad to have an opinion, and he therefore begs to be favoured with a call at earliest convenience. The whole tone of the application is as innocent as the purchase of sixpennyworth of sweets, and it is received in the same business-like way in which an order is taken for a new coat.

Thus it is that when an architect—a full member, let us suppose, of the Institute—finds a mischievous case against him taken up by a colleague with whom he has been accustomed to consider himself on the best of terms, the explanation is always very much the same: "I have no ill-will towards you, my dear fellow, far from it. I am very sorry to be against you, I would much rather be on your side; but a certain statement of facts is laid before me for my report, and—there you are! I know nothing of the rights and wrongs of the quarrel, and don't want to know. I have given my opinion upon what is a supposititious case, so far as I am concerned, and I leave it entirely to the parties to prove or disprove the facts; that is their business, not mine." Perhaps the victim of this insidious formalism may ask whether the witness will kindly consent to hear the other side; if so, the answer is equally glib: "My dear fellow, I am not the judge. I could not dare to interfere between you except as a regularly-appointed arbitrator; if I can do anything for you in *that* line I shall be most happy. In the meantime, as I have told you before, I have been asked for a report; whether that report is worth anything or nothing I really do not know; all I know is that I am subpoenaed, and—here I am!" If "my dear fellow" should then so far forget himself as to ask whether he might be permitted to see the report which is now so interesting to him, he may possibly be told that he certainly may if Mr. Solicitor has no objection; but whether Mr. Solicitor has ever been known to have no objection we are not able to say. At all events, the unfortunate litigant in due course of time sees his amiable friend in the witness-box; and, inasmuch as every person who finds himself in the witness-box by virtue of a consideration of so many guineas to be paid—the disposition to pay being in some degree dependent upon the value of the evidence given—is laudably loyal to his retainer, and so far loyal also to *amour propre* that no man likes to be on the losing side if he can help it, we need scarcely say that the "report" is soon discovered to be more or less damaging, and generally more rather than less than might have been expected. What makes the matter worse is that the witness will offer to shake hands after the battle is over, and, while pocketing his guineas at the expense of his defeated "dear fellow," will perhaps jovially rally that dejected combatant upon some want of generalship whereby the weak points of his evidence were not brought out as they ought to have been in cross-examination.

Now, all this is very painful to narrate as unexaggerated fact. Whether it may be the case that the solicitor in the first instance entraps the witness into the delivery of a report almost to dictation (as is sometimes alleged afterwards in shame); or that the architect of a certain class is in the habit of regarding a lawyer with so much awe that he is helpless in his hands; or that the temptation of a few guineas cannot be resisted; or that the titillation of the sense of self-importance is chiefly the motive impulse; or that all these influences alike, together with a *souffron* of that enjoyment which human nature is said to derive from the misfortune of one's friends, generally combine to make a weak man do an unbrotherly act; certain it is that in perhaps no other profession in England would such unbrotherly behaviour be possible, and almost still more certain that in no great guild like the Royal Institute of British Architects would it be tolerated. We may remark that even amongst architects themselves it is known by the ugly name of *Cannibalism*.

If we be asked to make a definite proposal upon the subject, we are prepared to submit that in no case of a *personal* nature ought any member of the Institute to report adversely upon any matter of a colleague's business until after hearing his explanations. If lawyers of the less scrupulous sort should object to this on some technical ground of their own, so much the worse for their law; upon the practical ground of honest fair play between brethren it seems to us that no one could possibly object to it. We have purposely avoided setting forth the particular artifices of assault which a litigating architect has so much to fear; we have contented ourselves with stating that they cannot be put in force with any effect without treacherous aid from within the pale; our further proposition simply is that the authorities of the pale are responsible for the permission of the treachery, or where is their authority?

EVERY-DAY ART.*

ORNAMENT being a subject about which so many people who were not designers have posed as legislators, there is a pleasure in meeting with a book by a man for whom it is a reality, and who in consequence is not likely to be extravagant in the use of words and phrases which have no reference to the strokes of a pencil or a brush.

Mr. DAY, the author, is one of the ablest of English designers, and his book shows that he can write almost as well as he draws. It would be difficult for an artist who has produced so many kinds of designs to treat of ornament without saying much that was instructive; but the attraction of Mr. DAY's "Every-day Art" does not entirely consist in the abundance of practical hints which it contains. What we admire in it is its frank expression of the difficulties which beset the decorative artist in the present day. To many the practice of design for decorative purposes may appear a simple affair—one which is adapted for those who are deficient in the ability that is needed by the painter of easel pictures, the sculptor, and the architect. There is, it is true, a kind of design much fostered in schools of art, which is as mechanical as the plaiting of cane chairs; and unhappily it is accepted as if it were the best of its kind, and corresponded with the highest canons of art. Men who are not gifted with much artistic power can produce design of that class, especially if they will accept certain official recipes as divine inspirations. But a man who has the instinct of an artist will not allow himself to be so fettered; he will think for himself, although he runs the risk of incurring an opposition which may ruin him. Mr. DAY's book is adapted for aspirants of the latter class. It may be described as the effort of an artist to construct for his own satisfaction a theory of his art, by an independent study of nature and of the works of decoration of other times and countries. We seem to see the thoughts which are running through his mind while he is at work, and the efforts to conquer the sceptical suggestion that what he is doing is far from being right. "The knots which tangle human creeds" are as likely to be found near the drawing-board of a designer as near the altar of a priest, and there is a temptation in one place as in the other either to allow them to remain or to cut them abruptly. In Mr. DAY's book we learn how some artistic knots may be untied; but there are others which need an individual solution, and the reader finds he must deal with them in his own way if they are ever to be mastered.

One of the first of those difficulties is the relation of the designer to the art of the past. How many authorities would be found to agree in defining that relation? We sometimes, as in much architectural ornament, see that it is held to be best to reproduce old patterns without the least deviation. The old artists are supposed in those cases to have worked under conditions for insuring perfection which can never exist again. In ornament of other kinds there may be no less indebtedness, although it is not so openly acknowledged. Even when an artist strives hardest to be original, he cannot help repeating ideas which have been derived, directly and indirectly, from all sorts of sources. Mr. DAY has to own that "it is only by the widest stretch of courtesy that the greater part of modern ornament can be called design at all." We cannot escape from those old forms which savages, Indians, Greeks, and mediævalists devised, without a thought of the

nineteenth century. The question, then, is—How far are we to submit to what appears to be inevitable? and every student knows how difficult it is to obtain an answer from the oracles that is not a puzzle or a delusion. One tells him (with the sanction of the Government) that he "must enter into the spirit of the past age, and be imbued with the same feelings that then prevailed," as if it were an easy thing to project oneself into Athens and become a contemporary of PHIDIAS, or as if a certificate of the Science and Art Department endowed a raw youth with a capacity to understand the feelings of PERICLES and his contemporaries. When the official authorities on art are able to define what is the spirit of the present it will be time enough for them to talk about the spirit of a past age. But absurdities of this kind are common with the people who set themselves up for authorities on ornament. Mr. DAY is more reasonable when he suggests that the student should not restrict himself to archaeology, but should master old methods and processes as well as old forms. The forms may be no more than reproductions of some of those that were better and more ancient, but the craftsmanship which is seen in the manipulation of the material in most old work which has a claim to be called good is an incentive to genuineness and appropriateness in design. An intelligent study of pottery painting would be a bar to the production of elaborate engraved copies of Etruscan ornament which was done by a few strokes of a brush. The knowledge of processes can hardly degenerate into pedantry, and innumerable opportunities may offer themselves to utilise it. "If," says Mr. DAY, "the experience of the past is to serve our turn, according to the nature of our own work we must refer to the art of the particular period or people that afforded the most perfect examples of that kind; according to our particular difficulty we should refer to the particular style of art in which it had been most satisfactorily solved." It is evident from the last suggestion that Mr. DAY does not write for *dilettanti* folks, but for those who, like himself, are the guides of the workman. His regard for old work is determined by beauty instead of age, and the best of it is to him not the goal, but the starting-point of the modern designer. In nearly all of it Mr. DAY says we can discover something that can be a lesson to us, but it should not be forgotten that the old workmen were fallible, and that the styles have their characteristic defects. It would be more gratifying to our self-esteem if we could create forms altogether unlike those which have come down to us, but there seems to be a limit to human powers in the invention of ornament, and when the New Zealander of the future explores the ruins of London, it is not improbable that the remains of decoration which he may find will have a close resemblance to the forms with which he was familiar in the islands of the south.

No less important than the relation of modern and ancient work is the relation of ornamental art and nature. In England the official, and therefore the constitutional, theory is that ornament is more nearly allied to geometry than to nature, and, according to Mr. DYCE, R.A., designing it is practical science. "It is obvious," says the Government oracle, "that the power of representing objects in the form of diagrams is to the ornamentalist far more necessary and valuable than that of imitating them. There is a limit to naturalism in ornament while there is no limit in the opposite direction." The scarcity of conventional forms in modern ornament refutes this theory sufficiently. But what is more astounding is that Nature herself is supposed to work according to the rules laid down by the Department. Now we consider that if there is one quality paramount in such natural forms as flowers and trees, which are mostly employed in ornament, it is the absence of all conventionalism resembling that which is adopted in the art schools. No two leaves exactly correspond; there is a difference between the two sides of a leaf. In trees the very smallest branches seem to have an individuality of their own and contrive to assert it; leaves and blossoms have a like character. When this is to be seen around us it is absurd to say that a geometric symmetry prevails in organic nature. Even more absurd is the proposition that it is possible to give the essential character of a flower or a plant on a plane. Flatness is the first quality in what is supposed to be legitimate ornament, and if, mentally, leaves and flowers are put in a hydraulic press and well squeezed, they lose the defects which rendered them unfit from becoming parts of a decoration. A figure is obtained by this process, but it is not a representation of a flower, and only by a fiction do

* "Every-Day Art: Short Essays on the Arts not Fine." By Lewis Foreman Day. Published by B. T. Batsford.

people accept it to be so. Designers who have been trained from the first to look on flowers as things to be contorted into stiff diagrams do not see anything unreasonable in what they do, any more than the scientific fellows who, according to WORDSWORTH, are ready to botanise upon their mothers' graves. But there are designers who have studied flowers in a loving way, and can represent them as they grow. Yet, owing to the difficulties of the problem, and the force of prejudice in this country, some of these men will be found upholding the conventional theory. Mr. DAY is among them. Let anyone look at the figures of the apple-blossom, the clematis, the strawberry, &c., in his book, and it will be acknowledged that better drawings are not to be seen in the portfolio of a French decorative artist, and, indeed, few flower painters could surpass them. Yet Mr. DAY accepts the conventional theory, and declares that if Nature be in opposition to Art then so much the worse for Nature; in other words, we can do as we like with plant-form, and afterwards call the world to witness the success of our creation.

We may be wrong in our interpretation, but to us Mr. DAY's defence of the adaptation of plants and flowers is far from being enthusiastic. He reminds us of the orthodox controversialist who said it was a pity the congregation did not hear all he could say in support of heresy. What value can South Kensington set on a supporter who says "there is neither Art nor Nature in the grouping of any number of copies of the same prim sprig of foliage round a central point, like so many spokes of a floral wheel. To dissect a plant and arrange its members on a geometric basis is a somewhat childish idea of ornament"? Then, in opposition to the dictum respecting the limits of naturalism, he writes, "there is in the world such infinite variety he that needs must cling always to Nature's skirts has scarce occasion to let go his hold," and he allows that "there are cases in which imitation may be carried as far as you please, so long as it neither obtrudes itself nor brings into obtrusive prominence the object ornamented"? From all this it is plain that Mr. DAY does not consider Nature to be so imperfect as it is sometimes made out, and in many of his designs he conventionalises with as much tenderness as ISAAK WALTON had when he baited his hook. In some of his wall papers leaves alone are used, and they are of a kind which can be twisted readily, or, as sometimes happens, the family to which they belong is not suggested.

Conventional ornament it must be allowed has a great deal of logic in its favour; but as much or more might be urged in behalf of the geometrical diagrams which Captain LEMUEL GULLIVER found in the houses of Laputa. There is a higher logic in regard to ornament than was formulated in South Kensington, and we have yet to learn its conditions. The French, who have never lost hold of art traditions, do not consider it to be bad taste to adopt what we think is a naturalistic in preference to a conventional treatment of plant-form, whenever the occasion offers; and in consequence the artists have an infinitely wider scope for their operations, and can obtain a richness that is impossible with the English system, which, it should not be forgotten, has been only a few years in existence. In France flowers are more carefully studied than is the custom among English designers, and, accordingly, are more accurately represented; but the copies are supposed by us to be on an erroneous principle, because long ago there were artists who discovered that there was much more labour in imitating the appearance of a flower from a real one than in giving a traditional symbol of it. Mr. DAY dislikes the French wall papers, but they often suggest Nature out of doors (as did the despised trellis of roses with which LEIGH HUNT covered his cell); while a correctly conventionalised wall paper has little or no influence on the fancy, however much it may appeal to our reason by its scientific construction.

It is only in respect to conventionalism that we differ from Mr. DAY; with what he says in the other chapters of his book there will be general agreement. He claims for ornament no more than a subsidiary position, and he even defends it on the ground of utility. If things were perfect, it would be as needless to ornament them as to paint the lily or gild refined gold. The unpardonable sin is when decoration usurps the most prominence, and it is culpable when it is unworthy of its position, as sometimes happens with the painted panels of good cabinet work. But, after all, fitness cannot be easily defined. It must be felt, and Mr. DAY counsels the artist to make sacrifice of his work, if by doing so the general result is better. Being a worker himself, he has faith in the influence of labour.

A workman, he says, fairly proficient in any of the applied arts, who is in the habit of thinking over what he is about, must produce work that is apt. Ornament is affected by the tools which are available, and Mr. DAY maintains that much of the Greek ornament owes its character to the fact that it is brush work. Anyone who has attempted to copy the figures on a vase with a pen or pencil will be of the same opinion. It is in practice that the artist is educated, and it is, therefore, absurd when amateurs lay down the laws which are to determine the proportions in which colours should be used, and the character of the forms of ornament which are to be adopted. There is a difference between what they say and the "wrinkles" of an artist or the workman. As Mr. DAY well says: "In the difficulties of design every hint, however slight, is valuable; but all dogma is insupportable. The cultivated instinct of the artist must be its own law. Let him dare to be true to his artistic conscience, and he can afford to despise the theorist and all his works."

Artists who have been engaged in works of decoration in houses will unite with Mr. DAY in his condemnation of the system through which so many tradesmen obtain the commissions direct from the employer. This arises mainly from the want of knowledge on the part of the public. Why are houses furnished and adorned in a sumptuous and expensive style? It is not from any pleasure that the majority of occupiers feel in contemplating beautiful forms, but rather from the desire to impress visitors with their grandeur. In consequence, what is showy is sought after, and especially things which have been patronised by the great. We know of a case where a decorator received an immense number of orders because it got abroad that he had been engaged on the mansion of a peer. But the remarkable thing was that every one of the plebeian patrons insisted on having the same colours and patterns that had been adopted by his lordship, so that they could boast to their friends that in one way at least they resembled the aristocracy. Tradesmen are too shrewd to ignore the weakness of the public, and in consequence a style that is costly and obtrusive is sure to prevail. Another evil is that decoration has become as much a matter of fashion as costume. There is often more thought displayed in the pattern of a carpet, or curtain, or a piece of wall paper than in a picture. But while the humblest "pot-boiler" has a charmed life, and is able to survive periodical appearances in the "slaughter-house," after a short time the designer's work, no matter how great may be its beauty, loses its commercial value, and must submit to be set aside at a diminished price, because it belongs to "last season's patterns." Under such circumstances how can a designer throw his heart into his work? The public in general are unable to appreciate his art, and even those who should know better are not free from prejudice. The late OWEN JONES used to point out to his friends the one drawing which he sent to the Academy, and which was rejected. He was an architect, and it was an architectural subject; but he was known to be a designer of ornament for the backs of playing-cards and the wrappers of biscuit-boxes, and probably it was considered presumptuous for such a man to wish to see his name in the Academy catalogue. We are supposed to live in more liberal times, but everyone knows of the outcry that was raised last May when a few decorators' works were seen among the architectural designs at the Royal Academy. Etchings, miniatures, woodcuts, enamels, &c., were allowable in the room, but what was done by an ornamentist was taken to be a slur thrown upon architects by the academicians. If decorative art is to advance among us it must be sincerely admired and understood by a larger number of people than is the case at present, for only in that way can prejudice be overcome and the artist be allowed fair play. Mr. DAY's book is a means towards that most desirable consummation; it is a book for the public as well as for artists; a guide which those who have the bestowal of commissions will find it profitable to consult, while it is capable of stimulating the student to grapple with difficulties. The volume is excellently printed, illustrated and bound; nevertheless it has been published by Mr. BATSFORD at a very low price.

"Work," the painting by Mr. Madox Brown, in which Mr. Carlyle and the Rev. F. D. Maurice are introduced as looking at a group of navvies, is now on view in Messrs. Grundy & Smith's Galleries, Manchester.

THE BUILDING EXHIBITION AT THE AGRICULTURAL HALL.

ON Monday next the doors of the Agricultural Hall will be thrown open to the fourth building exhibition, which, despite the little difficulty that at one time appeared likely to interfere with its success, promises, so far as the number of exhibits are concerned, to be in no wise behind that of its predecessors.

Amongst the exhibitions annually held in the metropolis, the "Building Exhibition" must now be placed in the first category, and may be considered an established institution. A moment's reflection will make this apparent. Building is indubitably connected with the base of all home comforts, and this exhibition was first inaugurated at a time when public attention was being awakened to a sense of the improved conditions necessary to health in our everyday surroundings; and as sanitation is so inseparably mixed up with building proper, it is not to be wondered at that it has formed an important feature in each of the building exhibitions. As a nation, we are often difficult to arouse to a sense of necessary change, and once the feeling has taken root we are apt to pursue it to extremes; but we need scarcely object to it on such a question as this. To bear out our remarks we need only to allude to the exertions of Dr. RICHARDSON in this direction. In his inaugural address delivered before the Cheltenham Health Society on January 27 of the present year, he told his hearers that, in common with other workers, he had called attention to sanitary science for over twenty years without arresting public attention so as to make it take a living interest in sanitary labours, and that it was not until he had discarded the collection of evidence, and decided to adopt an allegory, that he fairly obtained the ear of the public. The City of Health, "Hygeia," is the allegory to which we allude, and that effected more than all the mass of evidence and experience of twenty years. It was translated into various languages, and found its way into the cottages of the poor as well as into the homes of the rich. We are thus indebted to an Utopian work for drawing attention to a subject that practical experience had failed to draw any response to, and we cannot help thinking that Dr. RICHARDSON'S exertions have helped, indirectly though it may have been, to the success of the building exhibition. Apart from the interest taken in the London exhibition, we may call attention to the exertions of the Sanitary Institute of Great Britain, who yearly hold a congress and exhibition in one of the towns of the kingdom, and that is only separated by name from the building exhibition. As an auxiliary in the same direction, we find that the National Health Society (which is under royal patronage) have decided to hold an exhibition in June, which will not only embrace all we find at the building exhibition, but other matters appertaining to public health. We may then fairly assume that the interest thus awakened in public exhibitions of this character will not be allowed to slumber, and that the Building Exhibition will take its place as an educational feature on one of the most important questions with which we have to deal.

Messrs. WELLS & Co. (Limited), of the Commercial Iron-works, Shoreditch, and Queen Victoria Street, occupy their old position at the east end of the hall under the gallery. At the time we write their exhibits are not completely selected, but, judging from what we can see, it will be more artistically arranged than heretofore, and the various articles exhibited will be of high-class manufacture. At the back, and standing in about the centre, will be built up three bays or sections, containing complete suites of chimney-pieces, grates, &c. The one to the right will contain a drawing and dining-room suite, consisting of handsome marble chimney-pieces, superbly mounted grates, kerbs, tile hearths of chaste design, fire-brasses, rests, &c. The middle bay will contain three complete suites, the chimney-pieces in this case being wood, with over-mantels, and the third section will be of similar character. Each of the wood chimney-pieces will be of different design, and composed for the most part of different woods. They will all be of high-class design and finish, being a portion of those that have recently been on view at the Queen Victoria Street show-rooms, and to which allusion was made a short time since in the columns of *The Architect*. Beyond these bays to the left will be one containing three kitcheners. One of these is a noble specimen of a culinary appliance, being 6 feet in length, with a grill stove at one end, high-pressure wrought-iron boiler,

handsomely mounted with tiles, and containing all the latest improvements. The other two are of smaller dimensions, but equally well appointed and finished. In front of these will be arranged a collection of baths, both mounted and unmounted. The now popular cast-iron baths will figure amongst these, and the firm will exhibit one of white porcelain formed entirely in one piece. Some very attractive lavatories will supplement this portion of the display. Next will come a collection of open and close hall stoves, including some artistic tile stoves, by which we mean stoves made entirely of fire-clay, and artistically coloured and painted. The next feature that will arrest the eye of the visitor will be an array of light architectural ironwork of the firm's manufacture, amongst which will be found some examples of very excellent wrought-iron-work. Away to the right of the exhibit will be seen a complete block of the less expensive kinds of register grates, including many mounted with tiles of a comparatively cheap character. Messrs. WELLS & Co. have always paid considerable attention to gas-fittings, which, at the previous building exhibitions, have been massed together in a separate erection. On the present occasion they will form a fringe to the exhibits, and will be arranged along the entire front of the space occupied, and will include a very varied assortment of the styles at present in vogue, including hall lanterns, brackets, gaseliers, &c.

The exhibit of Messrs. HAYWARD, TYLER & Co., of Whitecross Street, will comprise most of the leading appliances to which they devote especial attention. The most important among these will probably be the various forms in which they manufacture their full-flush valveless closets. This form of closet was, we believe, first introduced by the firm at the International Medical and Sanitary Exhibition at South Kensington, in the year 1881, and after most painstaking trials on the part of the judges was awarded the first-class prize. At the Brighton Health Congress, held at the close of the same year, it was highly approved of, and was awarded a silver medal. Again, at the meeting of the Sanitary Institute of Great Britain, held at Newcastle-on-Tyne in the autumn of last year, it was pronounced by experts the "cleanest closet in the exhibition," and here again it was honoured with the silver medal of the Society. Many eminent architects and leading sanitary engineers have accorded their approval of it, and amongst the notable places in which they have been fixed, we may mention the University Colleges at Liverpool and Leeds. They are exhibited in various forms to suit the requirements of different localities. Amongst the arrangements will be found one with CHANDLER'S patent overhead flushing cistern, and water-locking apparatus placed under the seat. For situations where the overhead cistern cannot be fixed, we have the full-flush closet, with HOWARD'S patent regulator, which is concealed under the seat. Another application is that in which an overhead cistern and "pull" are necessary, which is shown with the firm's improved syphon cistern and bell-pull.

The "elastic-valve closets" also form an interesting feature in their exhibits, and the better qualities are notable for their fine finish and decoration.

Another closet worthy of mention is the "Special Sanitary Reform," which the firm claim as being the first introduced as a full-sized "valve-closet" at a price that enabled them to compete with the old-fashioned "pan" closet, an idea that has since been taken up by other firms. A good form of side-outlet closet is also shown, suited for use with their improved syphon cistern, made either in cast or galvanised iron. The "Bramah" high-pressure screw-down valve, made by HAYWARD, TYLER & Co., is also worthy of mention, as being suited to either hot or cold water, and is made with a fan key or with capstan-head, marked "hot" or "cold," the materials and workmanship being all that can be desired. A variety of other articles, including pumps, bath fittings, &c., help to make up an excellent collection.

The exhibit of Messrs. JOHN EBERHARD & Co., of Edward Street, Hampstead Road, will prove a most attractive one of its class, though at the moment we write it is not complete. The quality of Messrs. EBERHARD'S parqueterie is so generally admitted to be of a superior character that we may be pardoned if we appear to take more than ordinary interest in the firm's productions. Beyond the excellent workmanship, the sound materials, and the meritorious designs, the easy manner in which it can be laid on the most uneven flooring by means of the patent glue, invented by Mr. EBERHARD, is one of its greatest recommendations from an economic point, as by using this preparation the cost is materially reduced, and a bed as

hard as adamant is provided, which greatly aids its lasting qualities. Since the change in style of interior decoration, the firm have paid considerable attention to the introduction of dados in parqueterie, some excellent examples of which will be found amongst their exhibits, and a great variety of balusters and newels will help to make up their display. Numerous specimens of twists will be found amongst these, and the extensive machinery employed by the firm, of the most modern and approved character, enables them to produce these appliances at a remarkably low cost. But although machinery is used to a large extent in the manufacture of the cheaper articles, workmen of repute are always engaged in introducing original designs, in which wood-carving of decided merit is introduced where required. A section of a staircase baluster, the upper portion of which has been worked out in "Renaissance" in light oak, waxed, will we doubt not come in for a good share of attention; while a door and pediment in carved light oak, waxed only, will be one of the leading features in the display. The demand for wooden chimney-pieces has found Messrs. EBERHARD & Co. quite equal to the requirements of the times, and some good specimens of these will be shown. A mantel and over-mantel in plain oak, of a composite design, and another in American walnut, polished, appertaining to the Queen ANNE character, attracted our attention; but the firm are enabled to manufacture these goods at the lowest possible prices. Referring back to parqueterie, we may mention that some specimens exhibited at the first building exhibition have been exposed in an open position at the works in Edward Street since that time, and are to all appearance as perfect at the present moment as when first finished.

Birmingham again upholds its reputation for stained and painted glass adapted to window blinds and other decorative uses, in the persons of Messrs. HODKINSON & CLARK, of Small Heath, in the Midland metropolis, who will be found in about the same position as heretofore, and whose artistic little structure is as inviting to the visitor as at former exhibitions. Although we can but appreciate the cosy arrangements of this little house, "dropped" as it has been to all appearance in the centre of the Agricultural Hall in early spring, with its subdued tones and rich colouring brought out by the many specimens of coloured glass it contains, how much more should we not enjoy it in midsummer if it formed a part of our own domicile, with the assistance of the "Queen ANNE" blind and other applications of a kindred character, cunningly devised for the abstraction of heat, combined with the introduction of cooled air, giving comfort with security against thieves, and providing an efficient amount of ventilation, of which all who are interested in sanitation must approve. We doubt if any features now before us effect the objects we have named so well as the "Queen ANNE" blind and the "Early English" shutter. The former provides a permanent shade for windows, with a secure shutter, at the same time providing ventilation and preventing that glare of light so often complained of in many other blinds that attempt to arrest the inroads of the "orb of day." The Early English revolving-shutter is especially constructed for internal use, where it may be applied to any class of building, but may be said to be more in consonance with the style of architecture implied by its name, and requires only to be seen to render its acquisition a desire to all who study security in such appliances. It is drawn down as a blind, the action being so easy that the operation may be performed by a mere child, and without the slightest disarrangement to curtains or furniture that may be near the window. Contrasted with any other shutter for domestic uses, its advantages are clearly apparent, and, when drawn down, it may be made to form a decorative feature of itself, the surface being formed into little blocks with bevelled edges, which offer a fair field for the ingenuity of the decorator. Another blind, introduced by the firm some time since, and that has had an extensive sale, is a metallic Venetian, which has been aptly termed "the blind of the future." Some rich festoon blinds supplement the exhibit, nor must we forget the patent steel curtain for theatres, &c., a model of which was shown at the building exhibition last year, on which occasion we gave a description of it. The desirability of such an invention is likely to be more than ever appreciated, and with the alterations recently ordered by the Lord Chamberlain in many of our theatres it would have been well to have made it imperative for the lessee to have provided such an appliance for localising a fire, either before or behind the curtain.

Messrs. THOS. LAWRENCE & SON, of Bracknell, Berks,

contribute an attractive little erection about 14 feet high, built up of their celebrated red-facing and rubber bricks. It is almost needless to say that this firm have acquired a well-earned reputation for their productions, which are no doubt amongst the richest in colour and finest in quality brought into the market. The clays from which the bricks are made are of very fine character, and we believe considerable care is taken in their selection. Orange, cherry red, and a rich dark red are the colours affected, and the firm also supply the material in blocks of any required size for carving, a specimen of the latter being shown in the form of the royal arms on the front of the erection here shown. They also show a hand-made pressed facing brick of a very superior character, and their pressed plain roofing tiles, made in red, strawberry, or dun colour, are guaranteed to withstand any weather. Messrs. LAWRENCE'S productions are very moderate in price for their quality, and, we understand, are increasing in sale to a very large extent.

Messrs. ROBERT BOYLE & SON, of the Holborn Viaduct and Glasgow, are present with a large array of their ventilators, adaptable to any kind of building. Since the last building exhibition the firm have scored some remarkable successes, and their long list of prizes has been added to by the addition of two gold medals, the most important of which we presume in the estimation of the firm being that awarded them at the Shipwrights' Exhibition, held at Fishmongers' Hall, for the ventilation of vessels without the possibility of the sea-water entering the ventilators. This has brought them to the front in a new department of ventilation, which was described in the columns of *The Architect* at the time. But one of the most important works in which Messrs. BOYLE have been engaged during the past year, and which we entered into exhaustively at the time of completion (although it will not be out of place to mention it again here), is the ventilation of the Council Chamber of the Guildhall, a room that had baffled the ingenuity of some of their competitors, and on which so much money had been spent by the Corporation, with unsatisfactory results, that they determined not to entertain any new contract for the work except upon the principle of "no cure, no pay." That the firm have solved the "knotty problem," and by very simple means, is now comparatively a matter of history, and the means by which it was accomplished may be obtained at their stand, where also an extract from *The Architect*, giving the *modus operandi*, may be had by any person asking for it.

Nor must we omit to mention Messrs. HAYWARD BROS. & ECKSTEIN, of Union Street, Borough, who have a prominent exhibit, illustrating their system of ventilation, and also their patent "semi-prism" lights for directing daylight into basements, which have done much to obviate the burning of gas by day in thousands of underground apartments both in the metropolis and many provincial towns. By the adoption of these lights, not only is the cost of gas saved, but the atmosphere of the apartments is cleared of a mass of noxious products, and the health of those who are obliged to pass their hours of labour in such places is necessarily improved, and their occupation rendered less irksome. The class of ventilation essayed by the firm is mainly for domestic apartments, "SHERINGHAM'S Inlet," of which they are the proprietors, being the one adopted for the admission of fresh air. One of the most recent contracts in which the firm has been engaged in this department, and which we understand has been completed to the entire satisfaction of the governing body, has been the ventilation of the new City of London Schools on the Thames Embankment. This has been effected by using the above-named ventilators of various sizes for the inlets, and the success of this undertaking should materially assist the firm in obtaining other contracts of a similar character.

Occupying (as last year) a leading position in the centre of the hall, the exhibits of Mr. HENRY CONOLLY, of Hampstead Road, will, we believe, prove one of the most interesting in relation to interior fittings and decorations in the exhibition. Those who recollect the last year's display will remember the handsome collection of coloured and painted glass shown by this firm, and the artistic manner in which it was arranged. On the present occasion visitors will see a similar display, the examples being applicable to window-blinds, for windows themselves in their various applicabilities, either to church, public, or domestic uses, not omitting restaurant decoration, into which this class of ornamentation is now entering most extensively. There are few firms that appear to have fallen in so readily with the change of fashion in glass

as Mr. CONOLLY has done, or who is enabled to offer these embellishments at so low a price, which will be patent to all when the exhibition is open. But this is only one feature of the firm's display. Gas-fittings in their many phases will be extensively exhibited, and to say that great taste has been shown in their selection is merely to employ the most commonplace language in speaking of them, while to attempt to individualise certain patterns would fail to convey a correct impression of them. In this department, as in all others into which the firm enters, a very notable feature must not be overlooked, viz., the large numbers of every article shown that is kept in stock. The requirements of the present day are such that orders in most instances for interior fittings are supposed to be executed *instantly*, and those who are enabled to comply with this demand have the best opportunity of securing support. A notable feature in this exhibit will be a magnificent combination bath, which for elegant cabinet work combined with its other attributes may be called the very acme of luxury. Another novelty is a "Bachelor's Bath," intended for the use of gentlemen, residing in chambers, or it would form a fitting adjunct to any house, and in many instances be as suited to the requirements of a lady as to the "sterner" sex. This bath is entirely closed in a mahogany case, and has the appearance, when shut up, of a wardrobe, but on opening the doors, which have double wings or leaves, and fold back as window shutters, a sitz bath of ample dimensions is discovered at the bottom. Connected with this is the back forming the needle spray, which is continued upwards and finishes with a douche and shower overhead, the usual hot, cold, and waste taps being provided. It will thus be seen that this piece of furniture combines all the features of the best-appointed multiple baths with the exception of the plunge, and this it is contended under ordinary circumstances a man does not require, as he prefers his "sponge" or "shower" to the full-length bath. The arrangement will no doubt find favour with a large number of those whose comforts it is intended to provide for. Lavatories have not been overlooked by Mr. CONOLLY, and a few commendable specimens are shown, and an admirable collection of closets and other sanitary appliances are exhibited. Amongst the closets a new patent in connection with the firm's elastic-valve closet deserves especial mention, as providing a reliable security against the admission of sewer gas into the house. A connection is made from the box in the form of the letter J, the earthenware arm being carried to the top of the basin in connection with the flushing rim. A second outlet, forming an extra precaution, is made just under the first, which effectually prevents the basin overflowing, the connection being made from the flushing rim without interfering with the ordinary supply. The overflow is protected by the clack being drawn back against it when in action, rendering it impossible for soil to accumulate on the edge of the overflow pipe. By this arrangement the overflow arm is always charged with water, and flushed every time the closet is used, and should there be a down-draught into the box from the ventilating-pipe, it is prevented from rising by the water seal. So far as we are enabled to judge, we consider the advantages of this invention have not been over-estimated by the firm. The previously patented elastic-valve closets are, in addition, shown, as well as specimens of the National patent side-outlet wash-out closets, and the "Crown" patent with S or P trap, both of which have their special features and recommendations. One noticeable item in connection with the closets shown is that they are not "elaborated" for exhibition purposes, but are exhibited here just as they are sold. As an accessory to the closets Mr. CONOLLY exhibits RAIMES'S patent deodoriser, of which he has become the sole maker, an appliance that has justly gained some notoriety. This apparatus, in the form of a small oblong box fitted at the side of the seat, will discharge a certain amount of deodorising fluid by merely pressing a small knob, and being connected with the water supply, immediately the handle is raised a further discharge into the basin in connection with the water takes place. This appliance is under perfect control, is simple, and thoroughly effective in action. Another object of interest is Mr. CONOLLY'S new patent water-waste preventer, valveless, leverless, and noiseless. As may be presumed from this it is made on the syphon principle, and may fairly claim to take its place amongst the simplest and best now before us. Apart from the ball-valve, there is nothing connected with it likely to get out of order. The contents are syphoned very rapidly, the velocity increasing to the end of the discharge, and not any more water than the container will

hold can be used at one time. The syphon is brought into action in connection with the pull, which draws the float down and so starts the cistern, and the supply is made with a long nose which carries the inlet down to the bottom of the cistern, thus obviating the objectionable noise of the inrush of water. There is also an admirable automatic flushing cistern for urinals, dispensing with the usual float or ball and substituting a coil of pipe in its place, with the outlet on a level with the bottom of the cistern. The supply of water can be arranged to flush the urinal at periodic times, and, immediately it reaches a certain height above the coil, the weight causes it to rise through the coil, and the syphon action takes place in the usual manner. We have by no means exhausted the important examples on this stand, but must content ourselves by saying that the other exhibits comprise a large collection of general sanitary appliances, amongst which may be mentioned an excellent housemaid's slop sink, and a great variety of bath and lavatory fittings, plumber's brasswork, &c.

The handsome show-case of the Sanitary Paint Company, South John Street, Liverpool, will again form an interesting feature in the exhibition, besides other examples of their manufactures. "GRIFFITHS' Patent White" has now an historic name amongst the pigments of the day, and although we have before called attention to it, there is an amount of satisfaction to be derived from advocating the use of colours that are non-poisonous, in these times when science is ever on the alert to guide in the selection of those materials from which the greatest safety to health is to be obtained. For it is not only in the *groundwork* of all colours that the Company excel, but every one they have introduced is warranted to be non-poisonous; even the emerald greens, the hitherto most obnoxious of paints, is in their hands rendered harmless. In looking at the beautiful tints of dry colours shown by the Company it is satisfactory to know that, when mixed with the ground colour, GRIFFITHS' white in place of white lead, no harm to health is possible; and, referring back to the "white," it is cheaper than its prototype, inasmuch as it covers a greater surface, is possessed of greater body, and is far superior in durability as well as colour, while it has also the attribute of always retaining its opacity and of not becoming transparent. Heat does not appear to blister it; it mixes easily, and unites with other colours without interfering with the most delicate tints; but, above all, its hygienic properties should recommend it above all its other points of excellence. The superiority of the "Patent White" over white lead, and even the ordinary zinc paints, is oftentimes clearly shown in large towns where, under the influence of the gases evolved white lead often becomes almost black, and common zinc paints cannot withstand their inroads; but "GRIFFITHS' White" is not affected. The appearance of these paints, both white and other colours here shown, have a very rich appearance, both on wood and metal. Amongst many medals awarded to this paint in different parts of the kingdom, the Sanitary Institute of Great Britain some time since granted it their special gold medal as an "exhibit of pre-eminent merit." For exposed situations, a special quality called "silicate paint" is prepared by the Company, which, while combining all the meritorious features of the others, presents a surface of extreme hardness. Their "silicate distemper," a non-poisonous water paint, deserves to be widely known for its durable and economic features as a wall covering and substitute for papers. This, too, is produced in all colours, and being washable is admirably adapted for hospitals, prisons, &c.; at the same time, it may be treated artistically, the specimens shown by the Company in this direction warranting the assertion. The distinctive feature of this paint is that it is mixed with water instead of oil, and is used as a self-colour. One other production remains to be noticed—viz., their non-poisonous petrifying liquid for damp walls, brick courses, &c., which has been extensively used, and an examination of the examples on view at their stand must convince the most sceptical of its valuable attributes.

Of sanitary appliances proper no better collection will be found in the hall than the exhibit of the old-established firm of GEORGE JENNINGS, of Stangate, Lambeth, who may fairly be called the pioneer in this industry. Nearly the whole of this exhibit may be said to be made up of specialities. There is a mounted bath of copper japanned, with the firm's patent fittings. These consist of anti-percussion valves, arranged similarly to those of a water-closet, closing gradually, and preventing the friction attendant upon the use of the ordinary

ones. There are several points of excellence in this bath, that we would recommend our readers to inquire into. Attached to it is a shower arrangement, of a simple character, consisting of a rose, about the size of a plate, carried up at one end in connection with the hot and cold supply pipes, by which means the bather can indulge in a shower at any temperature he pleases, as the taps are both under his control, and he can indulge in this as a luxurious pastime. A combination lavatory and urinal, in plain or enamelled slate, is a most useful appliance. In this, the lavatory, having a tip-up basin, discharges its water at the back, and the urinal is underneath, which, having a valve connected with the door, discharges a certain quantity of water on opening it. There is also exhibited an automatic flush for urinals, made up of a coil of pipe instead of the usual bell or drum, that can be made to discharge its contents at almost any given time, according to the rate at which the water is allowed to enter the tank. For office use a handsome, circular-fronted, mahogany-mounted concealed urinal, of pedestal form, is shown, opening with double doors, which actuates a valve, and discharges water in the urinal until again closed. This forms a most convenient and by no means unsightly addition to any bureau. We are next introduced to a combined lavatory, urinal, and slop-sink—a compact and useful appliance that may be placed on a landing or in the bath-room, which is securely trapped against the admission of sewer gas. Other slop-sinks of different construction are in addition shown, including wash-up sinks for butler's pantry or housekeeper's room, lined with wood, for washing up glass, &c., the arrangements for letting off the water and preventing any small particles passing into the waste-pipe being simple and complete. The display of lavatories is very extensive, and we may remind our readers that the late Mr. JENNINGS was one of the earliest manufacturers to introduce these useful appliances for domestic use in the form in which they have since been so generally applied. Amongst those exhibited is a very handsomely-mounted one with marble top and richly-decorated tip-up basin, with the addition of the shampooing arrangement originally introduced by the firm. A cheaper class of lavatory is shown in enamelled slate on iron standards, and in plain slate for schools; also on iron mountings, lavatories for yachts, ships, saloon railway carriages, &c., is another form in which these appendages are introduced to us. These are made with an inside turnover rim to the basin, that effectually prevents the water splashing over with the motion of the vessel. A replica of a pattern made for the new Inman Company's steamship *City of Rome* shows the "coign of vantage" obtained by this improvement. Before we leave the lavatories we must not omit to mention two veritable improvements that have been patented by Mr. JENNINGS. These consist of a simple arrangement for taking out the tip-up basin for cleaning, and another in connection with the soap and brush trays. As regards the former, that have hitherto been a fixture, by Mr. JENNINGS' improvement, when lifted at a certain angle the basin can be taken entirely out, and replaced when the interior has been cleansed. Soap and brush receptacles are generally "indents" in the marble or slate top, with a small hole communicating with the interior for drainage. These drainage holes often become clogged, and the improvement in question provides an independent soap and brush tray, with a small well in the centre, these fitting into a cavity prepared for them in the marble top. Simple as the alteration may appear it is a decided improvement, and will no doubt be duly appreciated. A range of urinals of a more expensive character form another feature. These have marble divisions, and white and gold lipped urinals. On the tread are openings communicating with shallow basins, that run off any overflow. The urinals have a back instead of a bottom outlet, with rather larger openings, enabling any foreign particles that may be thrown into them being the more easily disposed of. The firm also exhibit a range of self-acting latrines for schools and kindred institutions of a simple and effective character. We always look for a collection of closets in any exhibit from this firm, and the visitor will not be disappointed on this occasion. There are to be seen various specimens of the trapless and improved Bramah, and valve closets and trap in one piece of earthenware, and a collection of lavatory and other cocks, fittings, &c. Air-proof bricks, damp courses, &c., form another department of the exhibit, and a further section is devoted to the electrical apparatus incident to the security of doors, windows, &c., from the inroads of burglars, of which a

detailed description was given in *The Architect* a short time since.

A tastefully-arranged exhibit is that of MESSRS. HINDLEY & SONS, of Oxford Street, the objects shown being all for interior decoration. Stepping under a handsome façade, painted in terra-cotta colours and pure white, and draped and festooned with crete muslin, we are introduced to the different articles, which are arranged as they would appear in a room. The principal features are three wooden mantelpieces and over-mantels of plain wood, painted. The two side ones are coloured a dark blue and a dark green respectively, with here and there panels backed with Japanese leather and bevelled glass mirrors. The centre one is in ivory white, with plush-lined panels, bevelled glass mirror in centre, and small cabinet with glass doors. In design they are all of a classical character, the ornamentation being neat but effective, and have been manufactured by the firm to illustrate the low prices at which they can manufacture a really good and artistic article. A pair of good-sized, square, dark mahogany mirrors with candelabra, or sconces, form attractive couplets as wall decorators, and made of the same kind of wood, and looking as if the quartette should never be separated, are a music cabinet and a china cabinet. As if to bring out the graceful lines of the twain the more effectively, there is a little Anglo-Japanese occasional table in red enamel. The walls of the apartment are covered with a rich terra-cotta coloured paper, and around the top is a frieze of shaded terra-cotta paper, with a shelf on which are displayed a variety of specimens of old china, *faience*, &c. The deductions we draw from these exhibits, after inquiry as to price, is that the firm have sought to illustrate at what a very moderate price a reception-room, be it boudoir, drawing, or dining-room, may be furnished in really refined style in accordance with modern notions. In addition to the articles already named, MESSRS. HINDLEY & SONS exhibit about eighty patterns of Japanese wall papers, a class of wall decoration they have to a great extent made their own speciality. To show the rapid advance these papers have made in public estimation, we may mention that only a year or two since, units, in numbers of patterns, sufficed for the demand, where tens are now required, and should the interest in these decorations still continue, they will ere long become as numerous as those of French or English make.

PARIS NOTES.

AT the last sitting of the Académie des Inscriptions et Belles-Lettres, M. Renan gave some further details relative to the ruins of the old Jewish synagogue, the discovery of which near Tunis by Captain Prudhomme, of the French army, was referred to in our number of last week. These ruins are situate about ten miles from the capital, near a lake at Hammam-Lif, the old Adaquas Gumritanas—without doubt a watering-place. The excavations commenced by M. de Prudhomme resulted in the discovery of a large hall, 25 mètres long by 9 mètres wide, and, being continued by Generals Lambert and Legerot, three other rooms have since been brought to light. Facsimiles of the mosaics found have been taken and submitted to the Academy for future consideration.

The Municipal Council have designated M. Cousin, director of the Carnavalet Museum, and M. Th. Vacquer, Custodian of Antiquities at the same institution, to observe and control the excavations necessitated by the construction of the new Rue des Arènes, a concession for which was lately granted to Messrs. Naud. It is believed that the projected street will pass directly over a portion of the site of the old Arènes de Lutecia, where the Roman conquerors of Gaul, and, later on, the native Merovingian kings, held their public festivals and games. There is general disapproval of the threatened destruction of the last vestiges of the place, and endeavours have been made to induce the Municipal Council to withdraw the concession. This the Council refused to do, but requested the Académie des Inscriptions et Belles-Lettres to choose one of its members to follow the work, in the interests of archæology and in company with the representatives of the city. The Academy has responded by electing M. Charles Robert.

The jury for the painting section of this year's Salon has elected M. Bouguereau president, MM. Cabanel and Busson vice-presidents, and MM. de Vuillefroy, Humbert, Tony Robert Fleury, and Guillemet secretaries. MM. Bonnat, Baudry, De Neuville, and Van

Marcke having signified their unwillingness to take their places as jurors, have been replaced, in natural sequence, by the four first supplementary jurors, MM. Bonvin, Carolus Duran, Gervex, and Breton.

The architectural section of the Académie des Beaux-Arts has adopted the proposal of M. Abadie that the subject in the final competition for the Grand Prix de Rome should be *A Necropolis*. The ten favoured competitors—MM. Redon, Quatesons, Gonvers, Bergon, Tobel, Fontenelle, Devienne, Henri Legrand, Norbert Maillard, and Defrasse—entered the *loges* on Monday last. The duration of the contest is one hundred and ten working days, and the result will be declared by the Academy and its assistant jurors on Saturday, August 4.

The jury of the Ecole des Beaux-Arts has delivered its decision in two important competitions. In that for *A Face in Oils*, out of ten competitors a single medal was awarded to M. Baschet, pupil of MM. Jules Lefebvre and Boulanger; while in the preliminary stage of the half-yearly drawing contest, open to all pupils of the school—the subject for which was *Orpheus and Eurydice*—the following ten were chosen to compete in the final stage (a large figure modelled from Nature):—MM. Couvers, Hannau, Gasq, Desvergnès, Verlet, Sicard, Pepin, Ploquin, Grandmaison, and Roullant.

M. Paul Baudry has just presented to the Ecole des Beaux-Arts a superb collection of water-colours executed by him at the British Museum. They are to be placed in the Salle Melpomène.

The direction of the Beaux-Arts has received from the Italian Government official notification that another international competition is to be shortly opened for the erection in Rome of a monument to the memory of Victor Emmanuel. The conditions will be published immediately.

Several public meetings have lately been held in Versailles, St. Cloud, Ville d'Avray, as well as other places, in support of the scheme for the erection of a Crystal Palace in the reserved Park of St. Cloud. In deference to the popular desire, the Parliamentary Committee charged to report upon the project have decided to demand the immediate discussion of the Bill on the meeting of the Chambers after the Easter holidays.

The Prefect of the Seine has issued a note requesting architects, proprietors, and contractors who have constructed or would be disposed to construct buildings to be let out in tenements of from 150 frs. to 600 frs. annual rent, to send in as speedily as possible to the "Sub-Commission of Cheap Dwellings" at the Prefecture of the Seine their plans and estimates, accompanied with explanatory notes. The same invitation is also addressed to those who have built, or would be willing to build, furnished lodging-houses and detached cottages, the tenants of which might become owners in a certain number of years by payment of annuities in the form of rent. It is evident that the Paris municipal authorities have taken up and intend to grapple in earnest with the important problem of providing cheap and healthy dwellings for the working-classes.

The Municipal Council a short time ago voted the sum of 45,000 frs. to enable the City of Paris as a corporate body to take part in the Amsterdam Exhibition. This would have sufficed, if, as in the case of other foreign exhibitions, the City could have arranged its exhibits in the galleries of the building itself. It turns out, however, that the space of 200 square mètres allotted to the French capital is situate in the Exhibition grounds, and it will, therefore, be necessary to erect a special pavilion for the reception of the collections it was intended to send. The cost of this building is estimated at 45,006 frs., and the Prefect of the Seine has referred the matter to the Council to decide whether, notwithstanding this doubling of the expense, the City shall be represented at the coming show. The question will come up for discussion in the course of next week.

"ST. AUGUSTINE'S CHAIR," CANTERBURY.

ACCORDING to Canon Venables, the term "St. Augustine's chair" for the stone *cathedra*, or patriarchal chair, in Canterbury Cathedral, which was used on Thursday, is misleading. Instead of ascending up to the close of the sixth century, it cannot claim a higher antiquity than the thirteenth. As the distinguished archaeologist Abbé Martin clearly showed between thirty and forty years back, this chair belongs to the same era as the tomb of Archbishop Langton, who died in 1228. The summit of the back of the chair, with its two almost circular incisions, correspond precisely with the outline of the arms of the cross on the archbishop's tomb. The Abbé noticed other minor points of resemblance, on

which it would be tedious to dilate. The chair is constructed of Purbeck marble, which did not come into use until the twelfth century at earliest, and was certainly unknown in the days of Ethelbert and St. Augustine. Besides, it is in three pieces of stone, whereas the old throne is said to have been of one. This *cathedra* may, however, not improperly be called "St. Augustine's chair," as representing that traditionally said to have been the one in which the kings of Kent had been enthroned, and presented to St. Augustine by his royal convert, but it cannot be too clearly understood that it has no pretence whatever to belong to any such remote antiquity.

The patriarchal chair was placed for the enthronisation, not in "Beckett's crown," which is the designation of the circular chapel at the extreme east end of the building, but in the apse of the "Trinity Chapel," a little beyond the site of "Beckett's shrine." The brick tomb of the younger Coligny, Cardinal of Chatillon, stands in the first arch on the south side of the apse. This, however, is not the true place of the *cathedra*. In Hollar's plan it stands much more to the west, at the summit of the flight of steps behind the present high altar, a position roughly corresponding to its original place, as described by Gervase, between the two eastern pillars of the apse of Conrad's "glorious choir," approached by a flight of eight steps. It will be remembered that the remains of the stone episcopal chair may still be seen in the apse of Norwich Cathedral, in this, which the existing examples at Torcello, Parenzo, Aquileia, and elsewhere, show to have been its primitive place. St. Augustine's chair stood at the east end of Trinity Chapel when Winkles published his view in 1835. It seems to be unknown when and why the chair was removed to its recent most inappropriate place in the south-eastern transept.

MODERN GLASGOW.*

DURING the decade now closed Glasgow has been reconstructed to a remarkable extent. This reminds us of the operations of the Improvement Trust and the huge railway schemes, and these jointly have operated in clearing the worst districts of the city, but at the same time have diverted for ever from habitation enormous areas of the solum of the municipality. There has also been great change in the location of many of our industries, the great increase in the price of ground having caused manufacturers to transfer their factories to the suburbs, a change which the increased railway accommodation facilitates immensely. As an example of this, we are no longer the centre of the cotton manufacture, that industry being almost given up to Lancashire.

The development of our staple industry, shipbuilding, has not increased the population of the city proper, but has enormously added to the suburban, and it is a well-known saying that Glasgow's best life-blood flows with the Clyde.

Had the new houses erected throughout the decade been the natural result of the requirements of a new population, our growth would indeed have been startling, so much so that supposing at this rate the first stone of a new Glasgow had been laid in, say 1866, we would at this day have had a population nearly that of the present Edinburgh, or equal to the population of our city in 1831.

The decade may be divided into two periods of five years, the first of which were years of prosperity, the last years of adversity. Increase more or less marks the former period, decrease more or less the latter. The extensions of the city during the first half of the decade were, as is now amply proved, on too ambitious a scale, and, from causes partly physical and economical, have throughout the latter part of their growth embodied themselves in compact and straggling masses, leaving great spaces to lie in a waste condition, or be partly occupied by unsightly, ill-devised, and poorly constructed tenements.

In short, in the number of unoccupied houses there is much to strike the stranger, and, to say the least of it, they have proved most ruinous to the builders and the capitalists or bondholders, and it is much to be desired that for some considerable time to come building should proceed on a more solid basis, and that much more attention be given than has hitherto been the case to planning houses promotive of health and comfort to the citizens, soundly constructed, and well drained; and certainly one way to arrive at such an end is to proceed on more cautious and steadier lines.

It might be remarked here that, as is well known, the heritable creditor of late has got a severe shake to his confidence in stone and lime, and to those who are conversant with what has been tolerated in many quarters of the city such is not at all to be wondered at. It will be some considerable time before this confidence so much to be desired is restored to us, but there is no reason why heritable security should not yet gain the day. There can be nothing in this world better, and one way to reach and continue to hold this is that even the plainest houses should be well planned and carefully and substantially built, and the speaker has the strong impression that there should, under one Act of course, be classification of property, just as is the case with ships; and under the new Building Act, the town might be divided into districts, each

* From a paper by Mr. William Landless, architect, read at a meeting of the Architectural Section of the Glasgow Philosophical Society.

having a properly-qualified person as surveyor, whose duty would be, after the building was finished, to pronounce his judgment as to the class under which the tenement should stand.

The stranger on entering Glasgow, unlike Edinburgh, is not by any means impressed with any dignified notion of its grandeur, and until quite recently the view the stranger got in stepping out of the train at any of our stations was, to say the least of it, most miserable. However, this is more than in a fair way of being remedied, as the Midland, Caledonian, and North British companies have had their full allowance of the contents of the lime tub—possibly more than the shareholders care for. The stranger, were he to enter the city by coach, does so amidst the din of spindles, roar of machinery, and rattling of hammers; and even should he choose the silent highway as a means of approach, all beauty is left behind, and the eye sees nothing save a forest of poles and scaffolding, comprising the erections in the numerous ship-building yards on either side of the river. However, no sooner does he get fairly rid of the rail, coach, or steamer, than he begins to be impressed with the spaciousness of our streets, and the numerous and somewhat brilliant appearance many of our public and, we should add, private buildings present to the eye. It is not for those who live here to give truly an opinion of our city, but from many persons we hear its architecture very highly commended. It is enough to know that it is a hive of industry, and, withal, much is found at the same time to convey to a thoughtful mind that a considerable display of calm wealth, fine taste, and high beauty is the tone, without exaggeration, of many of our buildings. Glasgow certainly boasts not of the picturesqueness of Edinburgh, yet it goes some way to rival it in its own attractions, and is very far superior as a town to most of the great seats of trade in England. The city in general is remarkably well built. The building material is a fine, light-coloured sandstone. The street frontages are generally polished and lofty; the ancient districts have much haggardness and little of the old Scotch style which gives so romantic an appearance to the old town of Edinburgh.

The newer districts are ambitious and showy, some parts designed in very tasteful Italian. As for domestic architecture, there are many fine examples. The reconstructions of the last twenty years display a passion for variety of style and profusion of ornament, with effects more striking than may properly belong to the classic style; even here and there a strong, lofty iron shell on a stone base is not wanting, and paint is laid on in gaudy colours. However, such features are, as a rule, the exception.

Drygate, the Bell of the Brae (now removed), &c., show some ancient remains of former grandeur. Saltmarket was at one time the principal residence of the magistrates, including the Bailie Nicol Jarvie of the period. Trongate was the seat of all the main business of the city so late as the time of the tobacco trade, and is of good width and lined pretty regularly throughout with pretentious edifices. Argyll Street on the same line is all constructed on as stately and spacious proportions. Virginia and Miller Streets, striking off this thoroughfare to the north, were originally edified with mansions occupied by the tobacco lords.

The public buildings are very numerous, and make a great display. Variety, indeed exists—is even plentiful—but to this extent; and it is to be regretted that many of the buildings erected in the first half of the century, towards the close thereof, revelled in debasing the Gothic, modifying the Grecian, and blending and confounding different styles. It is thought that few cities show so much advancement in civil architecture as is evidenced by the erection of the numerous public and private buildings towards the close of the third quarter of the century, or say, from 1860 to the present time.

The municipal rooms were first situated at the Cross, thence were removed to a handsome pile in Wilson Street, built by Messrs. Clarke & Bell in 1841. It need hardly be said that the new rooms are to occupy the east side of George Square. The Merchants' House was first in Bridgegate, a fine symmetrical structure built in 1661 by Sir William Bruce; thence was removed to Hutcheson Street, contiguous to the municipal offices already spoken of, and latterly was removed to the new buildings forming the west side of George Square, in 1873. The Trades' Hall, built by Adam in 1791, is standing, as designed by that architect, however. There is some likelihood of a fresh structure being erected before many years elapse.

Speaking of prisons, the one having any claim to architectural style is the one at the Green, designed by Stark in 1814. This architect also designed the beautifully-proportioned tower of St. George's, in Buchanan Street, and, by the way, it might be stated here that should the Corporation remove this church, as has been talked of, the tower should be allowed to stand; the body of the building would never be missed.

This tower, with a building designed in harmony and possibly less bulky than the present church, would, in our opinion, make an excellent suite of chambers for the Mitchell Library or a Presbytery House. When alluding to this tower, we cannot pass without noticing the satisfaction the profession have at the question having been treated in so concise and exhaustive a manner by Mr. Honeyman at our last sederunt; and, as you are aware from a few remarks made on that occasion, I intended to say a little about the question. I will simply add a word to what has been already so

well put by Mr. Honeyman. I may start by noticing a leading article which appeared in the *Herald* of January 31 last. The writer would like to see this church removed, as to do so would bestow on the town a site of great public utility. We think the profession (were it removed) would regret to see any building standing in its stead, as none would suit the site so well. Further, it is also argued that in no sense is the building artistic. "It is not with St. George's as with many of Wren's churches; it is on the contrary, both inside and out, a dull, heavy, uninteresting edifice." Far be it from us to undervalue Wren, than whom none has furnished London with so many fine specimens of his skill; but it is thought the architectural worth of St. George's steeple justly entitles it to be ranked alongside of Wren's St. Bride's and St. Mary-le-Bow, two of his best works. As to an architect of standing designing a church as commodious and infinitely more beautiful, we confess the accommodation would not be difficult to get; neither would it be specially difficult to have a more happy interior; but to design a more beautiful and symmetrically-proportioned tower would to us be a most difficult problem; and it is no compliment to say it is out of sight the most elegant architectural monument we could have of any architect; and we would be only too happy, if it is to be removed, to see it re-erected, of course on a suitable site.

Glasgow is not celebrated for its theatres. The one having any claim to architectural merit was removed a few years ago to make way for the Union Railway, and the present playhouses have nothing external to indicate what is behind.

The professional halls, not numerous, have an excellent example in the one owned by the Faculty of Procurators, built in 1856 by Mr. Charles Wilson.

The water supply enjoyed by our city places her a very long way ahead of any other town in the island. At the beginning of the last century Glasgow was supplied from about thirty public and a few private wells. An attempt was made about 1774 to introduce water, but this proved abortive. Another attempt was made in 1794, which also failed. At length, in 1804, due to the enterprise of Mr. William Harley, a reservoir was constructed at the upper end of what is now West Nile Street, and water was conveyed thereto from the adjacent lands of Willowbank. This, the enterprise of a single individual, induced a number of the inhabitants to form themselves into a company, which was done in 1806, when an Act was procured erecting said parties into an incorporation, who thereafter planted the works at Dalmarnock in 1808. The Cranston Hill Company got similar powers granted them. These companies went on for a time independently, but subsequently were amalgamated. The Gorbals Company came next in order, obtaining an Act in 1854, to bring water from hills to the south of the town, distant about seven miles. About the same period there was a scheme to bring water from Loch Lubnaig, which failed. The next point of supply was Loch Katrine. Although at first defeated, it was eventually passed in 1855. The works, a triumph of engineering skill, were opened by Her Majesty in 1859. The water area of the loch is about 4,000 acres, and the water-shed 50,000 acres. The yield twenty years ago was 15,000,000 gallons per day, and now is 39,000,000 gallons.

Having noticed water, a few words on gas. The first company was instituted in 1817, the second in 1843. The streets were first lit with gas in 1818. This notice on gas cannot well be closed without a single word regarding the Corporation's present intention to obtain a Bill to lessen the illuminating power, and, further, their apparent wish to monopolise the making of electricity for lighting purposes. As to the first part of the question, it seems more than unreasonable to wish to lower its illuminating power. The consequences of this will be very serious. As to the electric light it is thought that nothing ought to be done by any corporation in the least degree tending to cripple private enterprise and invention.

Under the head of charities, the most influential are those of the Merchants' and Trades' Houses, which each dispense princely sums by way of charity per annum. The Trades' House is the more wealthy of the two, comprising Masons, Wrights, Weavers, Hammermen, Maltmen, Coopers, Skinners, Bakers, &c. These two houses also return the members constituting a most important tribunal, called the Dean of Guild Court. This Court, however, is not found to answer the purpose now it may once have done, as no doubt it has done good service in days gone by. As is known, the Institute of Architects is desirous to have a general Building Act for Glasgow. Among other things thought desirable to provide for may be the division of the town into districts, each having a surveyor, who would obviously be a person trained to the profession, and vested with discretionary power to deal with plans brought under his review. It is very clear that something, were it only approaching this, would be better than the present state of affairs. Gentlemen constituting our present court cannot be expected, with their multifarious duties to attend to (certainly not the Dean, unless he happen to be an engineer) to know about practical building; although it must be allowed that the Dean and Merchants are much and ably assisted by the representatives from the Trades' House, who are almost always contractors for mason and joiner work of good standing. In a great and still increasing city such as ours, something on the lines indicated, which you are all conversant with, is devoutly to be wished.

NOTES AND COMMENTS.

MR. WHICHCORD intends, at the next meeting of the Institute of Architects, to call attention to the work of the Architects' Benevolent Society. Last year 527*l.* was distributed among thirty-six applicants for relief, being the largest sum granted during the existence of the society. The expenses were only 14*l.* 1*s.* 4*d.*, or about 6*d.* in the pound, which is much below the rate in most societies. It may be noted that in 1851 it cost 48*l.* 10*s.* to distribute 10*l.* in relief, and as late as 1877 we find that with an income of 394*l.* and grants of 443*l.*, the expenses were 134*l.* 15*s.* 6*d.* Of late years there has been a remarkable reduction in the expenses. At the present time there are exceptional calls on the society, but no more than a small proportion of the profession is represented in the list of subscribers. It has been calculated that of 1,100 members of the Institute only 226 contributed during the past year. An appeal is to be made to provincial architectural societies to support a fund which is available for the benefit of architects from all parts of the United Kingdom. The Council also say that "it is felt that an application to some of the great City Companies, and even to the Corporation of London, might be attended with not unfavourable results," but for the credit of the reputation of the profession there should be an effort to make so public an appeal for charity unnecessary.

MR. H. H. BLOXAM has drawn the attention of the local archaeologists to the mutilation and removal of sepulchral monuments in many of the Warwickshire churches. Among the churches mentioned were those at Compton Wynyate, Easington, Monks Kirby, Stratford, Hillmorton, Wolston, Kingsbury, Tamworth, Rugby School, and Rugby. Mr. BLOXAM says that "in the rebuilding, within the last few years, of the parish church of Rugby, much wanton desecration was effected. Some tombs have been entirely removed from the churchyard, and others transposed. The remains, reduced to black mould, of many a generation of the inhabitants of Rugby have been carted away to fertilise distant fields. The only historical monument in the churchyard—one to the memory of members of the CAVE family, containing an inscription written by Dr. HAWKSWORTH—was moved in the night time, and no longer occupies its original position. The original monument was set up about the year 1755–6; this was replaced about the year 1806–7 on the same site by the monument recently removed." Examples of this kind are a sufficient justification of the existence of the Society for the Preservation of Sepulchral Monuments.

THE graceful figure of *Bacchus* mounted on a tiger, which was exhibited in the Royal Academy in 1879, was by itself enough to excite interest in any works which might afterwards be produced by the sculptor Mr. SIMONDS. But his work is of a kind that demands much time for its completion; and, since then, Mr. SIMONDS was represented at the Academy only by a small, although remarkable, head of *Medusa*. He has now completed his statue of *Perseus*, which has been in hand for nearly five years. It is of course difficult to make a single mythological figure tell its own story unless by following precedents. In the case of *Perseus* there is a temptation to imitate CELLINI's example, and represent the hero after his victory over MEDUSA. Mr. SIMONDS has, however, selected an incident which we believe has been hitherto untouched. He represents the hero at the marriage feast, when, by exhibiting the Gorgon's head, he changed PHINEUS and his band of disturbers into stone. Mr. SIMONDS' *Perseus* is a man who, from his immense power of muscle, might be taken for THESEUS, and he ought to be able to remove his enemies without the aid of the Gorgon. He appears to regard them with a scornful air as he draws the scarf with one hand from the head which is held suspended in his other hand. There is much novelty in the action, and great pains have been taken in modelling the figure. The only objection that is likely to be raised when the statue is seen in the Royal Academy will be in respect of the head of the hero, which can hardly be called Greek. But Mr. SIMONDS probably desired to give a Renaissance rather than a Classic character to the figure. It is a remarkable work, which we hope may soon appear in a more enduring material than plaster.

THE evidence in the Govan School Board case has been completed, and the judge announced that he would make

ad vizandum, or, in other words, consider his judgment. As commonly happens when there are collapses of buildings no architect is responsible for the fall of the shed, although at the time of the accident there was a different belief. The clerk of the School Board had to admit that there was no superintendence of the re-erection of the shed, although he "thought he had given instructions to the architects to inspect the building occasionally." The Convener of the Building Committee, who is a valuer of property, and saw the shed after it was re-erected, said he believed there was nothing wrong in it, but on an examination of the *débris* he thought it was defective in structure, and that the materials did not correspond with the schedule. It is plain that the accident arose from a false economy, and if justice were done it is the members of the School Board, and not the ratepayers, who should be responsible for the damages.

To the eyes of Londoners it is remarkable to find soldiers guarding such buildings as the Law Courts and other public buildings, and an ordinary guardsman assumes a new interest when he is discovered marching in front of an office which was always supposed to be safe. But there is apparently no other way to obtain security. What is more needed is the passing of an Act for the regulation of the sale of dynamite and similar explosives. The injury to the Home and Colonial Office suggests the destruction that is inevitable whenever dynamite is placed in a position that is favourable to its expansion. At Westminster, fortunately, it was placed outside the building; but the floor of the room that was nearest to it, and which was strongly formed of wood joists and plates on sleeper walls, was practically destroyed. The fireproof arches which formed the ceiling and the floor of the room above were acted on in a different way. They were lifted and fractured, but as the material was the DENNETT concrete they were not dislocated. In fact, the explosion might be said to resemble one of the impact tests to which the material has been often subjected without detriment, although in this case it was an exceptional experiment. There is no doubt that it was to the intervention of Messrs. DENNETT & INGLES' arching that the safety of the upper storeys of the building are mainly owing. When so dangerous a material is available for the use of men who are not even bound by the usages of war, there will be risk unless stringent measures are adopted to control its sale.

THE Sanitary Protection Association of Edinburgh, which was the first constituted in Great Britain, has been five years in existence, and it has been more successful than similar societies in the metropolis. On March 18, 1882, there were 500 members, of whom 445 were ordinary subscribers of one guinea each, and 55 were extraordinary, paying larger subscriptions. This year the ordinary subscribers number 483, the extraordinary 100. The total receipts for the year have been 808*l.* 1*s.*, as against 622*l.* 13*s.* The inspections of public buildings and country houses have increased in number, and the directors of the Bank of Scotland have placed the whole of their branch banks, numbering about 100, under the supervision of the Association as regards sanitary matters. 612 inspections have been made in the course of the year. About 100 country houses have been inspected and reported upon, and among them 90 per cent. were found to have direct communication existing between their drains and the interior of the house, 80 per cent. had their water-storage arrangements more or less faulty, and no less than 15 per cent. had the main cisterns in direct connection with large-built cesspools. Edinburgh derives a great deal of profit from visitors, but it is remarkable that only one application from a lodging-house keeper has been received, and not even one from a hotel-keeper.

A CURIOUS point has been raised in the Nottingham County Court in an action under the Employers' Liability Act. A plasterer was injured by a ladder breaking, and the jury assessed the damages at 60*l.* But the counsel for the builder objected that the notice from the plaintiff had not been properly served. It was sent through the post-office; but counsel argued that the notice must be put in the hands of the employer, or the plaintiff must call a person to prove its delivery, or it must have been sent as a registered letter. The judge considered the objection important, and has reserved his decision.

ILLUSTRATIONS.

NICHOLAS HOUSE, NICHOLAS LANE, KING WILLIAM STREET, E.C.

THE new building shown in the illustration has recently been in course of erection upon the site of the houses formerly known as Nos. 12 and 13 Nicholas Lane (one door from King William Street), and is now completed.

It possesses a frontage to Nicholas Lane of about 37 feet, and contains basement, ground, first, second, and third floors to be occupied as offices, and a fourth floor for the house-keeper's occupation. This floor is lighted from the rear of the premises, owing to the narrowness of Nicholas Lane and the opposition to the height of the former building being increased. It may also be mentioned that the central dormer had to be omitted in consequence of the objection made by the opposite owners on account of light and air.

The ground storey up to the underside of the string course below the sills of the first floor windows is of polished red Peterhead granite, in lengths of 12 feet 6 inches each; the cornices, window-heads, shafts, sills, and copings of the first and upper storeys being of red Dumfries stone, and the remainder of the front of Portland stone. The details of the masonry and carving are of an early French type.

The pavement of the entrance hall is of marble mosaic, and the walls are lined with a polished marble dado which is continued up the staircase. The staircase is of polished walnut with teak treads and spirally-turned balusters.

The architects are Messrs. CHARLES J. & C. HERBERT SHOPPEE, of 61 Doughty Street and 22 John Street, Bedford Row, W.C.; the contractor being Mr. E. LAWRENCE, of 16 Wharf Road, City Road, N.; and the clerk of the works, Mr. W. PROUDFOOT.

The granite work was executed by Messrs. MANUELLE, of Mark Lane, and the mosaic pavement by Mr. EBNER, of Clerkenwell Road.

MESSRS. RICHARD LLOYD & SONS' TOBACCO FACTORY, NOS. 78 & 77 FORE STREET, EXETER.

THIS illustration represents the principal front of the above building, which has been erected from the designs and under the superintendence of Messrs. CHARLES J. & C. HERBERT SHOPPEE, of 61 Doughty Street and 22 John Street, Bedford Row, London, for Messrs. RICHARD LLOYD & SONS, of London and Exeter, tobacco manufacturers.

The facings are of red brick, with Portland stone dressings and rubbed brick cornices. The representations of the tobacco plant upon the panels to the upper storey were carved by Mr. ALGAR, of Plymouth. The building is of considerable extent, and has also a frontage to South Street.

The works were carried out in a very satisfactory manner by Messrs. STEPHENS & BASTOW, of Cheltenham Buildings, Stokes Croft, Bristol, builders and contractors. The ironwork was supplied by Messrs. CHARLES WILLIAMS & Co., of Cubitt Town, E.; Mr. W. PROUDFOOT was clerk of the works.

GREYSFIELD HOUSE, BARROW, CHESTER.

THIS house is the residence of Mr. JOHN DUTTON, and is built of red bricks, with half-timbered gables. The porch is of English oak, the gable ornamented with "parquetting." The bricks, mouldings, and terra-cotta panels were supplied by Mr. J. THOMPSON, of Northwich. The work has been carried out by Messrs. ROBERTS & SON, Kelsall; the plumbing and painting by Mr. G. SPENCER, Kelsall, from the design and under the superintendence of Mr. W. H. KELLY, Architect, Chester.

STUDIES FROM THE LIFE, BY M. LE CHEVALIER CHEVIGNARD.

NAILSEA COURT.

THIS interesting old manor-house, of which an illustration appeared last week, is situated about two miles west of Nailsea Station, on the Great Western Railway, and nine miles from Bristol. It is chiefly of the time of Elizabeth, with an earlier part of the reign of Henry VIII. Over the mantel, in one of the oak-panelled bedrooms, now exists the remains of the arms of the COLE family, carved in oak. The house is now in rather a dilapidated state; nevertheless, it is full of interest to the architectural and archaeological student.

SIR R. P. COLLIER ON ENGLISH ART.

THE prizes won by the students of the Nottingham School of Art were presented to the students on the 21st inst. by Sir R. P. Collier. In the course of his address he said we had not been until recent times an artistic nation. There had been no renaissance of art in this country, for the simple reason that there never was a renaissance until the last century. He feared that our ancestors at the time when Raphael and Michael Angelo were painting in Italy, though undoubtedly they must have been very worthy and excellent persons, were scarcely able to understand or appreciate their works, still less to emulate or imitate. He was afraid the same thing must be said when later on Rubens painted in the Netherlands. It was true that distinguished foreigners had from time to time come amongst us and had condescended to paint our portraits, such as Holbein in the reign of Henry VIII. and Vandyck in the reign of Charles I., but they had founded no school of portraiture better than that presided over by Sir Peter Lely and Sir Godfrey Kneller. Early in the seventeenth century the Dutchmen awoke to the beauty of their own flat and comparatively uninteresting country, and their seas and skies, dykes, wind-mills, and cattle were painted by many, and amongst them Hobbema and Ruysdael; while the diversions of the Boers were painted by Teniers and Ostade more than a century before our picturesque country, as we supposed, at all events, our equally interesting rural life, had any adequate record amongst us. Perhaps we should not be wrong in saying that the home scenery in England—our picturesque home scenery—was first thoroughly painted and appreciated by what was called the Norwich school, by Crome, Cotman, and others of that school, and that our rural life was first well painted by Morley. He knew that Wilson before that had done something in the landscape style, and Gainsborough had painted broad and bold landscapes, but not by any means carried so far. Perhaps the first of all of our great painters was Hogarth, who flourished early in the last century, and lived almost to the establishment of the Royal Academy, and that brought him to the first important establishment in this country for the encouragement of art. The Royal Academy was founded rather more than a century ago, and it struck him that perhaps he could not do better than occupy the short time during which he should trespass on their attention by instituting a brief and necessarily a very imperfect comparison between the state of some of the leading branches of art at this time and one hundred years ago. Now, with respect to quantity there could be no question, but quality was the more material consideration. In regard to the drawing of the human figure, he did not say that that was the highest branch of art, but a necessary element in the highest branch. On that subject he would ask anybody competent to judge to go to the South Kensington Museum and see the two cartoons by Sir Frederick Leighton, "The Arts of Peace" and "The Arts of War," and he ventured to say that if he was competent to judge he would pronounce no drawing equal to that was produced in the last century, not excepting those of Haydon, Fuseli, West, and even Sir Joshua himself. One might say the same thing to a certain extent of some pictures by Millais, Poynter, Tadema, and a few others. Then, again, he looked upon *Punch* as a landmark in the advance of drawing, while the other illustrated journals and publications proved that there could be no question that very great national progress had been made in the art of drawing, and more especially of that of the human figure. In portrait painting we must confess that Sir Joshua Reynolds had not found his equal, and we must further admit that Gainsborough and Romney in moments of happy inspiration seized upon what might be called the volatile essence of female beauty, which escaped some of the artists of the present day. A good deal of work of Gainsborough and Romney was very hasty and bad, and in point of drawing would scarcely pass muster in the present day; but, at the same time, he could not help thinking that, with that exception, portraiture would bear comparison with any in this country which had preceded it. It was more thorough and sincere, and less tricky and meretricious, than it was some time ago, and certainly than it was at the time of Sir Thomas Lawrence. In landscape he ventured to think that we were undoubtedly strong. He desired to say nothing in disparagement of the old masters of landscape, whose work was very much that of pioneers; still, he was one of those who thought that Mr. Ruskin did good service in removing them from their pedestals, which were rather too high, and in drawing attention to the greater merit of modern landscape painting, which was ignored by the people who were called connoisseurs, although he must regard Ruskin's adoration of Turner as blind. Turner was undoubtedly the first of landscape painters in range, versatility, and imaginative power; and yet he could not help thinking that at the present day we have a school of painters who, each in a narrower range, seize with still greater truth and vitality nature and scenes of beauty. There are at least a score who hold their own against all their predecessors, and more than that if we except Turner, and perhaps some people would say Constable. The water-colour school of landscape painting, which was almost entirely the product of this century, was unrivalled. Referring to sculpture, he supposed that Flaxman must be still considered the first of English sculptors, although good work had been recently done by Thorneycroft, Leighton, and others. He thought at any rate we might

console ourselves with the reflection that nowadays it would not be possible to produce so bad a statue as that of the Duke of Wellington at Hyde Park Corner. In architecture our position was attested by the numerous well-designed and artistic churches in most of our towns, and by our improved public buildings, although he thought that our house architecture still required improvement. Another branch of art on which he entered with some hesitation, because the subject was so large and there had been so much controversy about, was that of the decorative and industrial arts, which were still classed together. He did not object to the classification, but at the same time he must point out that although almost all industrial art was to some extent decorative, yet some decorative art, such, for example, as some paintings on walls, ceilings, and some bas-reliefs, lay beyond and above the mere industrial. By industrial art he understood the art of making every manufactured article which might be useful as beautiful as possible, so that they might not only contribute to our comfort, but educate our sense of beauty—one of the highest faculties given to man. It would be simply to deal in platitudes if he were to enumerate the advantages of that form of art. They knew how it employed labour, and how it employed female labour, which to his mind was of very great importance, for in that department of art women were as well qualified to excel as men. But it was important further, as providing opportunities for the discovery of genius, which otherwise would have remained neglected; and, above all, it was a matter of great national importance, for if they would sustain the daily-increasing competition with Continental nations, they must move on; they would have to improve in industrial art or they would be left behind by other nations. So far as decorative art was concerned, he knew there were some who thought that houses were decorated better in the early part of the last century than at the present time; there were those who looked back on the reign of Queen Anne and the First George with a lingering regard—days which he could not help thinking derived part of the enchantment from the distance from which they were viewed. It might be admitted that some part of house decoration might have been better done in the reign of Anne than was the case fifty years ago, for at that time decorative art was at its lowest ebb in England; but since that time there had been an immense revival. He was not only referring to the houses of the rich, but he was referring as well to the houses of the poor. It appeared to him that they saw fewer of those abominations of form and colour on the walls of cottages than they used to see, and he thought that they were replaced as a rule by more respectable works of art.

THEATRES.*

BY WALTER EMDEN.

(Continued from page 198.)

I WILL now refer to the action of the Lord Chamberlain, magistrates, and Metropolitan Board of Works, as regards the construction of theatres. In building a theatre within a certain district, before it can be opened, the plans, &c., have to be submitted and the theatre inspected by an officer appointed by the Lord Chamberlain, by whom theatres are licensed. Outside this district they are under the supervision of the magistrates. As a protection to the public that theatres are well constructed, no doubt the Lord Chamberlain's supervision was extremely useful, and the fact that the loss of life in theatres under the jurisdiction of the Lord Chamberlain has been so extremely small ought to be considered a proof of the benefits of this supervision. For this reason I cannot but consider much of the great movement now made about theatres in England as the result of general scare; still, when as now, a very large number of theatres are built in extremely contracted and varied positions it is no doubt very necessary that there should be some more regular authority, and one thoroughly conversant with building matters, in whose hands the supervision and guiding of the construction of such public buildings should be placed. That this supervision has so far been placed in the hands of the Metropolitan Board of Works is no doubt calculated to improve the safety of the public in theatres, and although it may create a considerable feeling of opposition and unpleasantness at first, particularly where theatres have been opened for long periods without accident, and the managers are called upon to make considerable structural alterations, still there is no doubt that when this feeling wears off it will be generally acknowledged that benefits have been derived therefrom. I do not wish to suggest that a speculator, for the purpose of making money, would build a theatre in any position and anyhow, but the supervision gives a surety to the public that there cannot be any possible risk of a theatre being built except with every possible facility for ingress and egress, and every other necessary precaution being taken. Of course, a theatre being a complicated building, it is extremely difficult for a body like the Board of Works or its officers to be at once so thoroughly acquainted with theatres as always to be perfectly correct in every opinion they express, or requirement they desire; but as the prin-

cipals in the office should be men of considerable experience in building matters, they ought not to take long before that difficulty is improved away. I can say from experience with the officials that they are in all cases quite open to reason, and if a question is properly stated, or a difference of opinion is properly laid before them, they will soon be found to take a correct view of the same, and rather facilitate than oppose the architect in his duties. No doubt in the Building Act itself there will arise many differences of opinion, and if the Board err, no doubt they will err on the side of over-precaution; but, at all events, it is better that a little more money be expended, and a little more trouble given, than that there should be any uncertainty as to the safety of the public for want of proper precautions. It would certainly seem desirable that, if the Board of Works are to have the supervision of theatres, there is no necessity for the supervision of the Lord Chamberlain's office, particularly where it is for one and the same object. It seems somewhat absurd that, after depositing the plans of a theatre with the Board of Works, and after passing through the stages of alterations until they express themselves satisfied and ready to grant their certificate, it should still be necessary to deposit plans with the Lord Chamberlain, for him to do the self-same thing which he does by his approval, and granting the licence for stage plays, &c. It may be said that if the Board of Works grant their certificate the Lord Chamberlain would not refuse his approval, but that is only another argument for not multiplying uselessly the difficulties and costs in building a theatre, which are already quite many enough. The Lord Chamberlain's censorship of plays is extremely desirable, and should, if anything, be extended, but still it would be very much better if the whole question of the construction of theatres rested with the Board of Works, or some such efficient authority. The magistrates—the other body in power—are likely to be misled, and, having usually no practical knowledge of the subject, are liable to take up impracticable theories, and then be very difficult to move from them. It seems to me that it would work more justly if in all public buildings under their authority, which have been approved as safe, and properly erected, by the Board of Works, a permanent licence were granted, subject to supervision or closing if they became disorderly houses; otherwise the licence once given should remain in force, the managers always maintaining any necessary regulations made from time to time for their safe and orderly working by the authority in whose hands such matters were placed. No taking out of yearly licences should be necessary. Many magistrates object to certain very respectable classes of places of amusement on some particular principle. Again, anyone, with or without reason, can lay a formal objection on some question of exit or other matter, which, after proper examination, turns out to be a myth; but it still gives no end of useless trouble on licensing day; in fact, the yearly licensing system of places of amusement is absurd, and in my opinion there is not a single argument in favour of maintaining such a system.

Prevention from Fire.

In dealing with this portion of the subject, the means of exit and entrance must be more directly referred to. It is now a requirement of the rules of the Board of Works, that there shall be at least two exits from every part of the house; that the floors of passages, staircases, lobbies, corridors, and landings shall be of fireproof or fire-resisting materials, and every staircase for the use of the audience shall be separate and enclosed by brick walls. There shall be no winding steps, and every opening in the proscenium walls—that is, between the stage and the auditorium—shall be closed by an iron door, and the openings are generally limited to one of a specified size. All theatres now in London are naturally not built of materials calculated to resist fire, although staircases, corridors, &c., may have been made to fulfil the requirements of the Board of Works; but in the event of a fire the passages, corridors, &c., would, I believe, in every instance take the whole of the audience without overcrowding; but the danger in case of fire principally arises from the fact that a panic ensues, and the people are apt to rush to one entrance, particularly the usual one to the building, and block it before they get into the corridors. As far as possible, one of the best arrangements for the protection of the public is that the different entrances to each part of the house should be on either side of such part, or as far apart as possible. If two entrances are close together the crush towards them would be but little relieved by the fact that there were two exits at one point instead of one, but by the entrances prominently situated being apart, the panic to a great extent ceases. The struggle and cries add to the excitement and panic, but when the way out is comparatively clear the panic soon ceases, and the danger in a theatre, as I have said, is the panic. If the crowd be orderly, less than ten minutes with the ordinary entrances at work will clear any London theatre. It is customary on either side of the gallery to have doors, which can easily be broken open, which doors lead into the staircases from the private boxes and upper circles to the corridors at the street-level, and it is also necessary now to have an extra separate staircase from the gallery direct to the street.

The pit arrangement is of a similar nature: it has doors which can be easily broken open at each side, and also an extra separate

* A paper read at a meeting of the Architectural Association on the 16th inst.

and direct exit to the street. The upper circle, dress-circle, and stalls have each staircases on either side leading to the corridor on the street-level; often the dress-circle is on the street-level. Of course, if the nature of the site will admit, on any level of extra exit-doors direct on to the street they should be made. There is also usually a royal entrance, which forms an extra exit in case of fire from these parts. No staircase can be less than 4 feet 6 inches wide, and that staircase can be used only to accommodate 400 persons. Staircases have to be increased by 6 inches for every 100 extra persons up to the maximum of 9 feet; but I consider that no staircase from the pit or gallery should be less than 6 feet in width, and, as far as possible, the staircases should be built in short flights with half-landings at the bottom of each flight. The proscenium wall must now pass right through the roof dividing the building into two distinct parts. It is necessary for the scene-dock, property-rooms, carpenters' shops, and store-rooms to be closed off from the rest of the house by brick and fireproof construction. The most constant source of fires arises from the use of gas. There are such a number of joints left ready for connection to floats and battens for lighting up the scenery, that there is always of necessity a considerable escape, and the material used for scenery is of such a highly-inflammable nature that but for workmen being continually at hand many more fires would occur. It would be extremely difficult, perhaps impossible, to construct a stage and work its machinery, which would be absolutely fireproof, with the present known materials, though much might be done to make it safer. The immediate neighbourhood of fire-hydrants, together with the fact that there are now no workshops allowed in the upper parts of a theatre, at least over the auditorium, all tend to reduce the chance of a fire on the stage. Taking it for granted that the regulations of the Board of Works are complied with, the real risk in theatres of fires is to the insurance offices. I do not believe, except the chance of suffering a few bruises in the worst of the rush, anyone would be seriously injured, though there is always the chance of an accident in the safest of buildings, which nothing can guard against, where fear governs a large number of persons. Over each extra exit there should be an oil-lamp, so placed that if the gas went out the exits could be seen at once. As the public are educated into the facts, and see promptly the means of extra exit—for all exits should be prominent and easily distinguished—they will divide into separate streams, when the greatest danger is done away with. The following are some few suggestions for the protection from or prevention of the spread of fire. In a new theatre it would be easy, without any considerable extra cost, to erect a building, as far as the auditorium is concerned, in a practically fireproof manner, although no doubt the use of wood in the auditorium very greatly assists the sound, and the loss might be very much felt in a large theatre; in one of this size it would not be of such vital importance. The means to be proposed must naturally partake more of the nature of prevention than absolute protection, as it would no doubt be impossible to build a theatre in all respects fireproof, although in the auditorium there would be practically nothing but the seats and curtains to take fire. In building warehouses where concrete and iron are used, no doubt there is a very considerable objection to the use of iron, as when it gets overheated it twists and possibly pulls down the whole of a floor which might otherwise have stood if it had been constructed of timber. But in warehouses there are large quantities of goods stored which serve as fuel to the fire, and are the cause of the heat which twists the girders. Remove this fuel, and the fire has not the means of life, having nothing to feed itself with. Therefore, where there are no stores to keep up a fire, a construction of iron and concrete would stand thoroughly well, and would not be subject to the same objections as in a building of the warehouse class. First, therefore, construct the whole of the circles of iron and concrete. This can be done in a very simple manner by rolled iron joists and concrete arches at a very little extra cost, and in new theatres might be made a regulation of the Board of Works. With regard to any woodwork which it may be necessary to employ for fixing the box-fronts, or to attach the lathing to for the under ceilings, the whole of it can, as well as the plaster and decorations to it, be coated in asbestos paint. The main structure of the roof can also be executed in iron, while the ceiling itself could be made in panels of a decorative class without any material in it likely to take fire. There is no insuperable reason that the whole of the circles should not be enclosed by brickwork walls, as the corridors and staircases have now, under the present regulations, to be entirely of stone or concrete.

These suggestions cover the auditorium. There is no doubt that an iron curtain is the ostensible means of cutting off the stage from the auditorium, but a curtain of this description is extremely cumbersome, and liable to get out of order, so that other means would be much more desirable if they are possible. In France an iron wire gauze curtain is used, but a curtain of asbestos cloth would certainly be effective, at least for a time. With the auditorium of fireproof construction, the whole question resolves itself into one of keeping the flames on the stage back, and staying a great deal of the draught so fatal in spreading fires, and thus giving the audience and *employés* sufficient time to get out of the building. In the construction of the stage a large portion of it could be very easily constructed of iron. There is no unalterable

reason why all the sides of the stage should not be constructed of iron and concrete, while the centre or working portion of the stage could be covered with asbestos paint, so as at all events to be able to resist fire for some considerable time; and such being the case, the question is either one of available exits or good appliances to extinguish fires. Referring to the greatest danger on the stage—the use of gas—if electric lighting were to become generally used upon the stage and auditorium the risk in theatres would be greatly reduced, and with such precautions as have here been named a fire of any consequence would be of very rare occurrence. Of course, in theatres there must be large quantities of rope and canvas, &c., as well as wood in the machinery and scenery which it would be impossible to render absolutely fireproof, and therefore for this reason prevention from spreading rather than thorough protection from fire must be obtained, which I would suggest can be done by some such means as are here pointed out, and to complete such course of prevention it only remains to remove the greatest cause of fires—gas—and substitute for it another means of lighting, which, so far as the inventions of the present day go, must be electricity.

THE EXPLORATIONS AT HISSARLIK.

THE following letter has appeared in the *Times* from Dr. William Dörpfeld, architect, in explanation of his article on the remains at Hissarlik, which appeared in the *Allgemeine Zeitung* in September, 1882:—

In March, 1882, I was engaged by Dr. Schliemann to assist him in his excavations at Hissarlik, and for five whole months have, on the one hand, along with Mr. J. Hoffer, a Viennese architect, investigated the different settlements already discovered there with special reference to their construction; and, on the other hand, have, as architect, aided Dr. Schliemann in the excavations he undertook to clear up finally the Trojan question. The results of these labours will be stated in detail by Dr. Schliemann in a voluminous work he is about to publish, which will contain illustrations of the most important objects found in the various strata. At the request of Dr. Schliemann I have given a brief outline of the chief results of the excavations in the article mentioned above; but there are some points in it which have been misunderstood by two of your correspondents, and which I should therefore wish to explain clearly.

The latest excavations have once for all established the fact that six different settlements have existed, one above the other, on the fortress-hill of Hissarlik. These may be severally recognised by their buildings, fortifications, and layers of *débris*. If Dr. Schliemann in his work on "Ilios" assumes the existence of seven settlements, this is because he adds to the other six a so-called Lydian one, of which, however, as he himself points out (p. 588), only pottery remains, and nothing in the shape of walls.

Among the six settlements two only are of importance, the second counting from below, and the topmost; they alone contain remains of buildings which are remarkable from their size or architectural character, and alone possess an artificially levelled platform which extends over the whole acropolis. The other settlements—the first, third, fourth, and fifth—were little better than villages, containing only small dwelling-houses, and with the exception of the fifth were probably confined to the limits of the acropolis. In the case of the fifth, we ascertained that its houses extended beyond the earlier acropolis. In contrast with the two principal settlements, we found, particularly in the case of the third, fourth, and fifth, no clearly marked stratum everywhere easily recognisable, but their layers of *débris* often overlap one another, and in different places are of different depth. This is due to the circumstance that their buildings have always been erected on the ruins of those below them, without the surface of the hill having been in any way levelled. Nevertheless the house walls of these three poor settlements can, if closely examined, be easily recognised. This brief description of the exact character of the ruins is no hurriedly conceived hypothesis, but the fruit of long and conscientious researches; I may add that it has been confirmed by all the scholars who have visited the site of Troy while the excavations were going on.

If, however, the existence of six different and easily recognisable settlements at Hissarlik can no longer be doubted, the question still remains open as to the precise age of the several layers representing them. Dr. Schliemann has hitherto refrained from assigning exact dates to the older cities, but he terms the five lower settlements "prehistoric," and justifies this name by the existence of extremely primitive pottery, stone axes, and hammers, and thousands of other rude stone implements discovered in them. Above these five settlements he places the Lydian one already referred to, since dark pottery of a peculiar kind is found in abundance just at this level, which he compares with the similar archaic Etruscan pottery of the *terramare* of the Emilia and early tombs elsewhere in Italy. In the uppermost stratum of the ruins he recognises, on the ground of the archaic Greek, Macedonian, and Roman pottery, sculptures, and coins found in it, the Ilium of the Hellenic and Roman periods.

On the other side it has been objected that the second city from below, which has certainly perished through some violent catastrophe, is the Macedonian Ilium destroyed by Fimbria, B.C. 85, and that no very ancient settlements can consequently have existed on Hissarlik. Such a theory, which displays an utter ignorance of all the facts, needs no contradiction. It is otherwise with a hypothesis which has found supporters in *The Times*, and which maintains that the uppermost city is the Roman one, the fifth prehistoric city being Macedonian, the fourth Greek, and the third pre-Greek, while the second must be the city around which the war celebrated in the "Iliad" was carried on, the first alone being of primeval origin. This hypothesis is certainly capable of scientific discussion, as it endeavours to harmonise in a simple manner the actual condition of the ruins with historical tradition. But this is not sufficient to prove that it is right. From an architectural point of view it can neither be proved nor disproved, since none of the buildings belonging to the first five cities display any architectural characteristics which could even approximately determine their chronology. The walls of the first, third, fourth, and fifth cities are built in the simplest way, either of rough stones cemented with clay, or of bricks of unbaked clay, and consequently exhibit a species of masonry which has been in use in the Troad from the earliest epoch to the present day. Architectural remains which belong to the archaic Greek and Hellenic period occur neither in the fourth city nor elsewhere upon Hissarlik. Of the two edifices which alone probably belong to the Macedonian age—the large marble temple of Athena and a small Doric edifice of porous stone—only the blocks belonging to their upper parts have been found; but their foundations, and consequently the exact sites on which they stood, cannot be determined with certainty. The other buildings on the acropolis of Novum Ilium, so far as their age can be ascertained, are of the Roman epoch; among these I may mention a magnificent *propylæon* and a large double *stoa*. Under these circumstances, it is true, the question as to the depth to which the remains of Greek and Roman buildings extend below the surface of the soil cannot be answered positively. On the other hand, Dr. Schliemann's statement that no Greek or Roman architectural remains are found at a greater depth than two mètres can be contradicted by no one, since it exactly describes the facts. The statement, of course, applies only to the hill of Hissarlik itself, as Dr. Schliemann has already pointed out in "Ilios," since even the Roman buildings erected on its sloping sides reach down to the level of the plain.

If, therefore, as architects we can find in the method of constructing the walls not the slightest ground for assigning a fixed age to the earlier settlements, we must turn, for an answer to this question, to the objects discovered in the houses, such as pottery, stone weapons and implements, ornaments, jewels, and the like. All these objects have till recently been exhibited for three years and a half in the South Kensington Museum, and are now to be seen in the Schliemann Museum at Berlin, where, as was the case in London, they are classified according to the strata in which they were severally found. It is the same system of classification as that adopted in "Ilios." I, as an architect, do not feel myself qualified to pronounce an authoritative judgment upon the age of these different objects; but prehistoric archaeologists, after a careful comparison of them with similar objects discovered elsewhere, have from the first agreed that the pottery found below the uppermost stratum—that is, at a greater depth than two mètres beneath the surface—must all be assigned to a remote antiquity.

SCOTTISH EXHIBITION OF OLD MASTERS.

THE Board of Trustees for Manufactures in Scotland have resolved to organise in Edinburgh a loan exhibition of paintings and drawings by old masters, and portraits of eminent Scottish men and women. According to the *Scotsman*, more than half a century has elapsed since the last of a series of six exhibitions of old masters was held under the auspices of the Royal Institution for the Encouragement of Fine Arts. It may, perhaps, be permitted to hope that the forthcoming collection will prove but the first of a new series, not limited to six; that, in short, we may yet realise on this side the Tweed regularly recurring, if not annual, exhibitions similar to those which, for many winters past, the London public have enjoyed at the hands of the Royal Academy. Much will, of course, depend on the amount of support accorded to the present enterprise, in the first instance by owners of works of art, and subsequently by the public in the way of attendance. As regards the former, a decidedly encouraging prospect is held out. In a circular they have issued, inviting contributions, the Board refer to the great additions made during the past fifty years to many private collections in this country; and it would seem that not a few of these are likely to be made available. Already the Board have received from various noblemen and gentlemen, as well as directors of public bodies, such offers of noteworthy pictures as lead them confidently to anticipate that the exhibition will prove the most interesting ever held in Scotland. Other collectors who may desire to contribute will be gladly heard of by Mr. Cornillon, acting secretary for the undertaking, at the Royal Scottish Academy

National Galleries, Edinburgh. It is in these galleries that the collection is proposed to be hung, the intention being that the exhibition shall be opened in July, and continued over August and September, the months when the city is thronged with visitors.

THE GLASGOW ARCHITECTURAL SECTION.

AT the closing meeting of the session of the Architectural Section of the Philosophical Society of Glasgow, on Monday evening, Mr. James Sellars, the president, delivered an address on "The Work of the Section: Past and Future." Alluding to the work which had been done during the session, he claimed for it that it had not only been of great practical value to the members, but of some public service. The paper on "Building Stones," by Dr. Wallace, was on a subject which deserved great attention in Glasgow in view of the important buildings in immediate prospect. Too little attention had hitherto been given to the selection of stone. Buildings erected forty or fifty years ago seemed to weather better than those erected four or five years only, but whether that was in consequence of the older buildings having been seasoned before the atmosphere of Glasgow got so smoke-laden and impregnated with injurious gases from the chemical works, or that the local stone had deteriorated in quality, he was unable to say. He was inclined to think that the somewhat remarkable extent to which buildings erected in Glasgow within the last eight or nine years showed evidence of decay, might be partly due to the extraordinary demand for building stone during that period, resulting in material being used which in quieter times would have been rejected as unfit for use, or, for the same reason, stones had been used immediately on being cut from the quarry, without any chance of being seasoned or of getting rid of the "quarry sap" before being built into the wall. The most eminent authorities were agreed that stone should be seasoned just as wood is seasoned before use. Passing on to the future work of the section—to subjects which might well engage the attention of gentlemen engaged in all branches of the building trade—Mr. Sellars first referred to a question which, he said, had arisen in connection with the proposed new Police Bill—viz., the desirability of having a separate Building Act, applicable not only to the city but to the suburbs, and dealing with all questions relating to the erection of buildings. That such an Act should be obtained was a view held very strongly by the Glasgow Institute of Architects as a body, and the present was undoubtedly a favourable opportunity for obtaining it if it was necessary. The principle of embodying building clauses in a Police Act was, its opponents said, out of date, and inadequate for the purpose in a great city like Glasgow. Mr. Sellars having described the clauses in the new Police Bill dealing with the construction of buildings and the provisions made for protection from fire, contrasting these with what was done in the same direction in the Metropolitan Building Act, next referred to the increased attention which was given to sanitary matters. He thought the public, and especially that part of them who had to do with the designing and construction of houses and their drainage systems, ought to be thankful that the subject was assuming an importance it had not before attained. The professional men—and there were many—who had given such things special attention for years, and the honest, conscientious tradesmen would have their work appreciated, while it would seem that it was no longer an economy to dispense altogether with the services of an architect, as was too much the case—especially in the erection of dwelling-house property—and to leave the providing of a large proportion of dwelling-houses to speculative builders innocent of an idea on sanitation, who built to sell, and who in turn left the laying and perhaps the arrangement of the drains as well, and the arrangement of the internal plumber-work, to whoever would do it cheapest. It was said that cheap work of any kind was dear in the end, and that was specially true in regard to everything about a house. It was a popular delusion that every house had an architect, and the result was that when such a state of matters had been revealed as had been done by these sanitary organisations it was immediately said, "The architects must be to blame." That feeling was certainly not discouraged by the new order of beings calling themselves sanitary specialists who had recently sprung into existence. It was too much the fashion to abuse the architect. He was the favourite butt of the riders of all sorts of hobbies, who charged him full tilt, and endeavoured to find a crevice in his armour that they might overcome him, and glorify themselves over his prostrate form. He seemed a convenient peg on which to hang all sorts of complaints; a sort of buffer placed between the public and the alleged sins of the builder and the plumber; a shield to receive the blows of righteous indignation which ought to fall on the layers of unjointed drains, the makers of unventilated traps, and the constructors of insanitary houses. Mr. Sellars wished to point the moral to be drawn from this increased attention to and extended knowledge of the subject on the part of the public—namely, that it was incumbent on architects and tradesmen of all kinds to give increased and more general attention to sanitation. In conclusion, the chairman called attention to a subject which he said had

before engaged the attention of the section—viz., the providing of better dwellings for the working-classes, the earners of less than 20s. a week, persons belonging to the labouring classes, who with large families were from force of circumstances compelled to herd—he had no other name for it—with the very dregs of society, the criminal classes. The problem was, he admitted, undoubtedly a difficult one, and whoever could solve it would deserve well of Glasgow.

A vote of thanks was awarded to the president for his address.

THE BIRMINGHAM EXHIBITION.

THE Spring Exhibition of the Royal Birmingham Society of Artists was opened on Monday. Including some 250 oil paintings, which are restricted to two galleries at the Spring Exhibition, and a small room full of etchings and studies in black and white, the collection comprises altogether some 900 works. Of these, the large majority are exhibited now for the first time; but a few of the choicest have been culled from recent Academy and other London exhibitions, or are lent for the purpose of the exhibition by private gallery owners. There are comparatively few works of dominant interest or excellence this time, but the average standard is satisfactory, and local art is on the whole very creditably represented. Some of the most striking and meritorious examples are by past or present Birmingham artists.

One of the rooms is occupied entirely by sketches and studies by the late Mr. Allen E. Everitt, for so many years honorary secretary to the Society. These are 160 in number, and, the *Birmingham Post* says, they will be quite a revelation to those who only knew Mr. Everitt's work by his later-exhibited pictures. A very large proportion of them illustrate Birmingham and its immediate neighbourhood, and these, we trust, may be secured for the town. If it be any way possible they ought to be secured, for it is scarcely once in several generations that the opportunity presents itself to any locality of obtaining records of so much artistic and historic value. The records vary from rapid and effective memoranda to the most elaborate and minutely-comprehensive expression of endless detail. Aston Hall he had studied from every point of view, within and without, and here its terraces and walks, its staircases, galleries, fireplaces, chambers, &c., appear and reappear in a succession of most admirable sketches. The old houses in Deritend and Digbeth, picturesque bits at Moseley and Handsworth, our older chapels and churches, bits of Birmingham that have now disappeared, but are not yet forgotten (e.g. Ann Street as it was in 1873), half-timbered and other houses in the outlying areas, the finer architectural features of our neighbour towns—Shrewsbury, Ludlow, Warwick, Coventry, Worcester, Lichfield—records of visits to more remote parts of England and to the Continent—all these are rendered with a fineness of hand and a soundness of judgment very remarkable. Mr. Everitt has gone over all this ground, taking portraits of all that is quaint, or beautiful, or interesting in the architecture, drawing with unaffected reticence, giving us an abstract of essential features, rightly accented, and instinctively refraining from the one touch more that would have spoiled them.

THE AMERICAN TARIFF ON WORKS OF ART.

THE news that the United States' Senate has voted an entrance duty of 33 per cent. upon all paintings is causing a great sensation in the French world of art. This ad valorem duty of a third is to be levied upon the price actually paid by the amateur to the artist, and in order to avoid fraudulent declarations a clause has been introduced into the Bill whereby the Government is authorised to acquire any picture coming into the country at a small advance upon the declared value. The avowed object of the measure is to protect the rising school of young American painters, and it is bitterly remarked that in the great majority of cases these artists have pursued, or are still pursuing, their studies free of charge, either at the French Ecole des Beaux-Arts, or in the studios of the great artists whose works are henceforth to be subject to this prohibitive duty. Furthermore, their reputation has been gained and consecrated by the prizes and medals of the Paris Salon. It is scarcely to be wondered at that this extraordinary notion of gratitude, towards the masters who have formed the "rising school of American artists" referred to should have aroused a lively feeling of indignation. M. Albert Delpit expresses the general sentiment in the columns of the *Evénement*, by demanding (1) that the School of Fine Arts shall henceforth be closed to all American students, except on the payment of heavy fees; and (2) that the Salon jury shall be debarred from awarding any recognition to the works of American artists. One can hardly help sympathising with our neighbours in this matter, particularly as England also, though, of course, to much less extent than France, receives many art students from the New World.

When the news of the raising of the United States' tariff on foreign works of art become known, the American artists residing in Paris held a meeting and protested energetically against this proposed tax. The following resolutions were passed unanimously:—

"Considering that the raising of the entrance duty into America on the works of foreign masters will exercise a fatal influence on the development of art in the United States; that the majority of American artists owe their artistic education to French masters; that they profit by the hospitality and free instruction offered by the French Government at the Ecole des Beaux-Arts, as well as that afforded in other private schools; that they are deeply sensible of the impartiality shown by the juries of the various exhibitions, the American artists residing in Paris declare that they experience a deep feeling of indignation at the thought that the works of the men to whom they owe so much should be subjected to any tax whatever on entering American territory; and that they hereby petition Congress to repeal the law."

The meeting finally elected as members of a committee to draw up this petition:—Messrs. G. P. A. Healy, F. A. Bridgman, J. S. Sargent, D. R. Knight, Ch. Sprague Pearce, J. Stewart, F. S. Dellenbaugh, and W. Blackman.

It may be added that a protest of similar kind has already been published in a New York journal, under the title of "Protest of the Society of Young American Artists."

On this subject our Paris correspondent writes that the exasperation of French artists at the preposterous act of the Federal Government is rising dangerously high. At the Beaux-Arts and in the studios of private masters it forms almost the sole topic of conversation, and an idea may be formed of the prevalent feeling from the fact that one of the most eminent of French painters, and the head of a great *atelier* in which there are many English and Americans, has openly declared before all his pupils that, unless the law was absolutely repealed before November next, he would never receive another American in his studio, and would strongly urge their absolute exclusion, not only from the Ecole des Beaux-Arts, but also from the Salon and all other public exhibitions.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of this Association was held on the 21st inst., the president, Mr. MacGibbon, in the chair. Mr. D. W. Stevenson, A.R.S.A., read a paper entitled "System and No System in Art Education," in the course of which a comparison was made between the opportunities for obtaining education in their art at the disposal of students of architecture in Edinburgh, London, Paris, and Rome, details being given of the architectural sections of the schools of the fine arts in each of these cities, that of Paris being the most complete. Out of seventeen professors in the Paris school there were ten more or less directly connected with architecture. The progress of pupils was tested, and their zeal stimulated by frequent competitions, while prizes to the amount of 150*l.* a year—the income of legacies left to this department of the school—were at the disposal of the directors; and, in addition, the "Grand Prize of Rome," each year granted by the Government, enabled the winner to spend three years in Rome, where recently a pupil of this school, M. Nenot, gained the premium of 2,000*l.* offered by the Italian Government for the best design for a memorial to King Victor Emmanuel. This fact was considered a practical comment on the neglect of the study of architecture in the schools of art in Rome at present. The Royal Academy of London had, since 1870, well-equipped classes for architecture, and classes also existed at Kensington. But nothing to be compared with the complete organisation of the French school was to be found in this country; while in Edinburgh the student of architecture was left to fight his way single-handed through difficulties which only the most enthusiastic could overcome. Provision for affording the students of architecture in Edinburgh a more systematic course of study was urged not only on the attention of the profession, but of the public. At the conclusion of the paper, a hearty vote of thanks was accorded to Mr. Stevenson.

On Saturday afternoon the members to the number of sixty-five travelled to Dalkeith for the purpose of visiting the old Collegiate Church, which stands on the north side of the High Street of the burgh. The company were met at the entrance gate to the church by Mr. Inglis, the clerk of works, and directed through the building. In the course of their examination, Mr. MacGibbon, president of the Association, read a few notes which had been prepared by Mr. Stewart, chamberlain to the Duke of Buccleuch, respecting the edifice. The first structure on that site was erected in 1368, and was dedicated to St. Nicholas. It was 78 feet long, 53 feet wide, and 35 feet in height. The tower was 85 feet high. In 1406 Sir James Douglas rebuilt the chapel, and it was formed into a collegiate church in 1477, under the deanery of Restalrig and diocese of St. Andrews. That deanery was dissolved in 1592. The church was rebuilt in 1767, and upon one of its two bells there is a Latin inscription "Decora domine tuæ sanctitas O Jehova Dierum in Longitudinem; John Milne, facet, Edinr., 1768." In 1854 the Duke of Buccleuch caused extensive repairs to be made

on the western division of the building, and it was then rendered more comfortable for a place of worship. The walls of the choir, however, are roofless, and nothing of the internal furnishings remain; even the stones of the floor have been removed. On the north side of the choir is the vault belonging to the Duke of Buccleuch's family. It contains many ancestral remains, beginning with the second earl, who died in 1651, down to the late Duke of Buccleuch, who was interred there. The recumbent sculptured figures of the first Earl of Morton and his countess, much defaced by the action of the elements, and broken, are lying in the choir. The company then adjourned to Dalkeith Park, where, after looking into the elegant little chapel erected within the grounds, they proceeded to the mansion-house of His Grace the Duke of Buccleuch, where they were shown through the principal apartments by Mrs. Gibson, the housekeeper, and Mr. Inglis. After hurriedly glancing at the numerous art treasures which have been collected within the palace since its erection, nearly a century and a half ago, the company returned to town.

THE RAPHAEL CENTENARY.

THE commemoration of the four-hundredth anniversary of Raphael's birth was celebrated in Italy on Wednesday. According to the *Times*' correspondent in Rome, the morning broke heavily, and drizzling rain was falling. But as ten o'clock approached, the clouds passed away, and the pilgrims from the Capitol to the tomb in the Pantheon were able to start at the time appointed. A platoon of the ancient corps of the Vigiles, in their brass helmets, led the way, and then followed the municipal band, which played along the entire route. Next came two of the Fedeli, as the municipal servants are called, in their quaint mediæval costume, carrying large wreaths of oak leaves, with gilt acorns, the gonfalon of Rome, borne by an officer of the Vigiles, and the banners of the fourteen regions into which Augustus divided Rome, displayed by men of the same corps. These preceded the Duke Leopoldo Torlonia, Syndic of Rome; Signor Baccelli, Minister of Public Instruction; the venerable Count Mamiani, representing the city of Urbino; Baron Tautphœus, the Bavarian Minister, expressly charged to represent King Louis on this occasion, and the Marquis Gravina, Prefect of Rome. The members of the municipal and provincial councils followed. Then came in succession the members of the Academy of St. Luke, the members and students of the British Academy of Fine Arts at Rome, headed by their vice-president, Mr. Charles Poingdestre, the professors and students of the French Academy of Fine Arts, and the members, professors, and students of the various other foreign academies of fine arts in Rome, each with its memorial wreath, the members of the International Artistic Association, carrying the flags of all countries, the College of Engineers and Architects, the Society of Amateurs and Lovers of Art, the Society of Water-Colour Painters, the Roman Society for the Encouragement of Art, the Mosaic Workers, the Municipal Commission of Archæology, and many others.

The line was kept by the Vigiles, and the streets traversed by the pilgrims were crowded with people. The great bronze gates of the Pantheon were thrown wide open; the procession passed in, and drew up beneath the dome; the black veil hung in front of the niche fell, and disclosed the newly-cast bronze bust of the Prince of Painters—a copy of that in the Glyptotheca of the Capitol—and the simple ceremony of placing the wreaths commenced. When the space around the niche was covered, the wreaths were laid temporarily in front of the altar, behind which Raphael's remains lie, and on the floor before it, until a large area was hidden; and while the wreaths were being deposited, there fell from all sides showers of small bunches of the violet, the "mammola bella Maria," which Raphael, writing to one of his uncles in July 1514, said he had found in Rome. Many of the wreaths were made of the loveliest flowers. That sent by the King of Bavaria was of oak leaves, with gilt acorns. That of the British Academy was of laurel, and every one presented by the academies was tied with broad silk streamers of the colours of the country which had presented it, with the name of the Academy in gold letters upon them.

At the commemoration in the hall of the Horatii and Curiatii, on the Capitol, in the afternoon, the King and Queen were present. The Commendatore Quirino Leoni's discourse in honour of Raphael was an admirable review of the great painter's life and works, and of the times which gave birth to his genius. The *cantata* composed by the Maestro Falchi for the occasion, and sung by the members of the Academy of Santa Cecilia, a chorus of two hundred voices, surpassed what was expected from this rising composer's high merits, and met with loud and long-continued applause.

The Hall of the Tapestries was set apart for the exhibition of the beautiful cabinet picture by Raphael, of *Apollo and Marsyas*, borrowed by the Municipality for the occasion. The King and Queen, on leaving, lingered a long time admiring the work, and congratulated its fortunate owner, Mr. Morris Moore. This gentleman's large donation towards the purchase of Raphael's house at Urbino, some years ago, was referred to with gratitude by Professor Leoni in his discourse.

The Trastevere witnessed a remarkable scene. The Duke Ripalda, considering himself ill-treated by the Government, has kept the Farnesina closed since the celebrated grove was cut down some years ago, but on Wednesday he withdrew his prohibition. A large crowd had assembled there long before the doors were opened at ten o'clock. The hall where the Cupid and Psyche frescoes are was literally crammed, and new comers streamed in all day long, delighted to see their old favourites again. Many thousands, among whom the Roman populace formed the majority, must have visited the Farnesina. At three o'clock in the afternoon the crowd waiting their turn to get into the hall extended out through the garden into the street. In the evening the Trastevere and the House of the Fornarina were illuminated.

ARCHÆOLOGICAL LECTURES.

A COURSE of lectures will be delivered by Professor C. T. Newton, at University College, London, during the ensuing term, on the useful and decorative arts of the Greeks and Romans, as follows:—(1) April 20, "Mines and Metals." (2) April 27, "Metallurgy." (3) May 4, "Writing and Writing Materials." (4) May 11, "Masonry, Carpentry, Materials used in Building." (5) May 18, "Fictile Art, Glass; Ivory as applied to Decoration." (6) May 25, "Materials of Clothing: Weaving, Spinning, Embroidery, Dyeing." (7) June 1, "Agriculture." (8) June 8, "Wine-making: Cultivation of Olive." The lectures will be given at 4 P.M. in the Botanical Theatre. The public will be admitted to the first lecture without payment or tickets.

By the statutes which the University Commission approved for Lincoln College, Oxford, a Professorship of Archæology and Art was to have been founded out of the revenues of that college. Through the opposition of the Bishop of Lincoln, visitor of the college, these statutes were opposed by the House of Lords, and did not receive the assent of the Queen in Council, so that the scheme for the Professorship consequently fell to the ground. Lincoln College, however, comes forward with a proposal to carry out the endowment of this chair, as originally intended, provided its contribution in this way is allowed in place of other contributions to the Fund for University Purposes. A statute will shortly be proposed for the creation of this Chair. The Professor is to lecture on the arts, manufactures, monuments, coins, and inscriptions of classical antiquity, and on Asiatic and Egyptian antiquities, or on some of these subjects. The electors are to be a representative of Lincoln College, the Regius Professor of Greek, the Corpus Professor of Latin, the Camden Professor of Ancient History, and the Principal Keeper of Antiquities in the British Museum.

AN AMERICAN STYLE OF ARCHITECTURE.

THE following circular has been addressed, by Mr. H. M. Congdon (the committee), to the members of the Institute respecting the competition for the proposed building for the American Institute of Architects, which is to be, if possible, American in style:—

Dear Sir,—You are invited to submit drawings for the above competition, upon the terms and in the spirit of the following report of committee to Board to Trustees upon a "National style." As a Committee of One to whom was assigned the duty of preparing a report for the action of the Board of Trustees of the American Institute of Architects, relating to the instructions given them at the last Convention, concerning the fostering of an "American Style of Architecture," by announcing various competitions to its members with a view to that end, I would report as follows:—

In my opinion the Board of Trustees cannot adopt in its entirety the results of the debate upon this subject, viz.: that a distinctively American style is probable, or even possible in the near future. Styles among civilised nations were born, not made to order; born, not new-fledged and complete, but gradually evolved from necessity and local circumstances, and the result is that which follows healthy growth and sound principles in construction and ornamentation. Such styles have endured, and are worthy of our admiration and respect to-day, and it is a perfectly natural sequence that in our new country, peopled as it is from the old world—all its nationalities being here represented—we follow precedent; and in the amazing hurry of our lives find time only to adapt, if we do not adopt the result of the lessons so learned. Moreover, the times are changed, and we change with them; travel, in its more comparative ease and safety, opens the world's highways and byways to us; steam, the telegraph, and illustrated books all tend to make the world's architectural history an open page for us to read and use to our own advantage. In this way, while we have gained in information, we have lost the concentrated energy that animated the builders of the olden time, and are apt to fall into the danger of ever seeking some new thing. Hampered by no traditions, we pick and choose here and there, and mould and adapt to our own uses, ideas of ornament and construction

that may or may not be suitable to the everyday needs of our intellectual life and our practical surroundings.

But out of this no distinctive ideal of any style that can be called national has yet been evolved. Our students have either been educated abroad, or instructed here by professors who are imbued with ideas so gained, and whose models and text-books refer rather to the past than to the future. Our colonial architecture was, of course, an adaptation of old-world ideas, often in a new form of construction, and was in so far a new departure. Gradually, the fact of timber construction being a necessity in extending the means of rapidly housing an increasing population has developed a vernacular style, which, having no artistic merit at first or, indeed, until recently, has at this present a decided charm in its best type—that of the country-house—both in its artistic effects, and its completeness in domestic comfort, without being a servile copy of anything known to us in books or illustrated magazines, and is owing to the best efforts of our architects having been put forth in that direction.

Ruskin defines architecture as a "political art," and therefore its highest development is to be found in cities, where wealth gives the means, and the highest type of intellect its impetus; and it is here that the greatest failures are apparent by their conspicuousness. The contrast between the cities of this new country and their prototypes is not one that causes any complacency on our part as far as their architecture is concerned; and yet we have the same starting-point, viz., that of sound construction and true principles of design, avoiding flimsiness on one hand and extravagance on the other. The question therefore arises, keeping these kinds in view, Can we graft upon the necessities required by local circumstance and honest truth in construction any new principles of design that may eventually be called "American"?

The attempt to answer this question has been decided for us, for the time being, in the instructions given the Board of Trustees as the result of the debate in the last annual Convention; the end will show whether those instructions were wise, and whether the consequence will be one of which American architects will be proud. With the above end in view, it is desired that the Board of Trustees present for open competition among its members a problem, or series of problems, to be worked out during the ensuing year, and the design submitted to be exhibited at the next annual Convention.

To remove the problem decided upon from the realm of the ideal, and to make it eminently practical, it may not be amiss here to announce that the nucleus of a building-fund has been started through the generosity of one of our Fellows, for a building in New York city, to be the official home of the American Institute of Architects, and for all its members. This building should contain a suite of rooms for that purpose, one of which should be sufficiently large to serve for lectures, conventions, meetings, exhibitions, &c. In addition, a parlour of moderate size, a library, and a reading-room. The rest of the building should be designed with such ample office accommodations for architects and other tenants, with stores and warehouses on the lower floor, that the rental would free the Institute from all such expense. The lot should be a corner one, say 50 feet by 100 feet, the longer side facing the south, the shorter one the west. Entrances may be on either street.

The competition will be hampered with no instructions as to material, design, or arrangement, other than the above, and is, of course, to include all necessary safety appliances and conveniences, sanitary heating, ventilation, and plumbing. Fireproof construction is to be desired. The fact that the records of the Institute have just been exposed to the great danger of fire in the building lately occupied by the secretary renders the question of fireproof qualities a very serious one. The Institute is now burned out, and the records, books, pamphlets, and photographs seriously injured, if not partly destroyed.

The rental of the proposed building must be based upon the average rates in this city, viz., from 1.25 dols. to 1.50 dols. per square foot of occupied floor space; and it is a necessity that this must cover the object named, viz., that of giving the Institute its accommodations free of the ordinary expense of rent, &c., where rooms are hired, and possibly render the Institute self-supporting in due time. Designs should at least show plans of floors and two elevations at a scale of one-eighth of an inch to the foot. The designs submitted to be forwarded to the Committee of Arrangements for the next annual Convention.

The Board of Trustees reserve the right to publish such designs as they see fit, without prejudice to the others. This, therefore, is the problem offered to those members who participated in the debate which resulted in the above instructions to the Board of Trustees, and all others who are interested in the subject, viz., the development of an "American Style" of architecture.

Mr. Chas. Forster Hayward, F.S.A., was lately called in to advise the Committee of the Colchester Corn Exchange Company in selecting the best out of three designs reserved by them under the distinctive letters A, B, and C. The one chosen was found to be the work of Mr. Edward P'Anson, jun., who has accordingly had the work put into his hands.

JOHN OF BOLOGNA.

A BOOK on Jean Bologne, which is based on manuscripts discovered by M. Foucques de Vagnonville, of Douai, has been lately published in Paris. In reviewing it the *Times* gives the following account of the sculptor's career:—

Jean Bologne was born in 1524 at Douai—a time and a place as favourable to the career of a great sculptor as could well be imagined. His youth coincided with the ripest and greatest period of Michael Angelo's glorious career; and although his home was far removed from the birth country of the Renaissance, the artistic relations between Italy and the Netherlands were, and had been for years, of the most intimate kind. Ever since the days of the Van Eycks Flemish artists had journeyed to Italy, and some of them had gained high honours there. Michel Coxie and Bernard van Orley had been admitted to the studio of Raphael, whose famous Cartoons were executed in tapestry under their superintendence at Brussels; and Jean Schoorel, of Alkmaer, was intrusted by his countryman Pope Adrian VI. with the direction of the works at the Belvedere. Jean Bologne served his apprenticeship under the famous Jean Dubroeuq, "gentilhomme de race, graveur et tailleur expert et sachant bien l'architecture" at Antwerp; and thence he set out in 1551 for Italy, to complete his artistic training in the city where Michael Angelo was still living and working. His personal relations to his master and model seem to have been slight. Jean Bologne used to tell his pupils many years afterwards how he went with his first independent study in clay to Michael Angelo's studio, and how the great sculptor remodelled it entirely with a few touches and, returning it to the astonished beginner, said: "Or va prima ad imparare e poi a finire" (Learn first and finish afterwards). Whether the young man was encouraged by this somewhat abrupt reception to repeat his visit we are not told; certain it is that, to use Cicognora's words, "he formed his taste and his style on the modern works of Buonarroti." After two years' stay at Rome, during which he copied many famous works of ancient and modern sculpture, the resources of the artist were exhausted, and he was compelled to cut short his Wanderjahre. But before recrossing the Alps he determined to see the city of the Medici. "Heaven," says Baldinucci, "which had predestined him to embellish our dear Italy with his works, no doubt inspired him with the idea." In Florence, at any rate, he remained for the rest of his days, leaving it only for occasional visits to Rome and other Italian cities. His own country he never saw again. His first protector was Bernardo Vecchiotti, a senator of noble origin, whose family is mentioned by Dante in the "Divina Commedia." He was famous as an enlightened lover of learning, and his patronage of artists was not limited to mere admiration or good advice. "Seeing," as Baldinucci naively says, "that the poverty of the young man stood in need of help rather than of counsel," he offered to receive him in his own palace and support him for three or four years so that he might finish his studies. Giovanni Bologna, as now he must be called, accepted the offer of a home; but rather than abuse the liberality of his friend he undertook decorative work for his maintenance. He, for instance, executed in *pietra serena* the altars and window-facings of the fraternity *del Ceppo*, and also worked under the architect Bernardo Buontalenti, at the ornamentation of the Griffoni palace. Very soon, however, a higher sphere was opened to the artist; Vecchiotti introduced him to Francesco de Medici, the eldest son and heir of Cosmo, who soon recognised Giovanni's merit and continued to employ him for the rest of his days, jealously watching over him, and only under extreme pressure allowing him to work for others. For soon the artist's fame began to spread, and princes and cities vied for the honour of possessing his statues and bas-reliefs. When Vasari in 1572 introduced him to the Pope he called him "the prince of Florentine sculptors," and he relates how the flying Mercury—molto ingegnosa cosa e certe tanto rarissima—excited the unbounded admiration of connoisseurs. Later on the Emperor Rudolph, the son of Maximilian, after having tried in vain to allure the sculptor to his court, conferred upon him the nobility of the Empire—an almost unprecedented honour for an artist in those days. In his later years Giovanni lived the simple and monotonous life of a man wholly wrapped up in his work. He was not rich, for he cared little for money, and his protector had not inherited the liberal instincts of his ancestors, the merchant princes of Florence. "He is by no means avaricious," a contemporary letter says of Giovanni, "and is indeed very poor; his thoughts are bent on glory, and his only ambition is to become a second Michael Angelo. He is in the habit of buying back the juvenile works, which he considers imperfect, for more money than he had ever received for them, in order to destroy them, and more than once he has asked the Grand Duke to let him remodel the *Venus* which His Highness has in his chamber, but he despairs of ever obtaining it." In another letter written by the artist himself he asks a friend to intercede with the Grand Duke for an increase of his pension, seeing the number of works he has executed for his patron and the splendid offers from the Emperor and the King of Spain he has refused on his account. "Plead for me with His Highness, and only say four words in my favour. These words," he adds with manly pride, "I could not utter myself. I have only learnt to act,

not to speak." One is glad to find that this modest demand was complied with, in a modified way, and at little expense to the Grand Duke it is true. For it seems that the estate granted to Giovanni, instead of the money he asked for, was the confiscated property of Giulio Landi. Little else is known of the artist's life. He was married, but left no children to inherit his name and his genius. His noble career came to a close on August 13, 1608, when the artist died at his house in Borgo a Pinti, aged 84. The next day he was buried in the Chapel del Soccorso, erected by himself.

The chief works of Giovanni Bologna are known to every student of art. Most of them appear heliotyped in this volume with the addition of historic and critical notes as to their date and value. His first important marble statue was a *Venus*—"una statua di marmo bellissima," Vasari calls it. It is among the few of Giovanni's works in which the female type of his Flemish home can be discovered. Generally his women show little of the substantial charms in which Rubens delighted. Grace and lightness, almost airiness, of composition are the qualities he most generally strives for. The female figure in the *Ratto della Sabina* is placed in the arms of her captor with masterly ease, and still more marvellous, even from a mechanical point of view, is the famous *Flying Mercury*, poised with one foot on the head of Boreas, or rather on the breath which issues from that head. In such powerful compositions as *Samson and the Philistines* and *Hercules killing the Centaur* the influence of Michael Angelo is most plainly shown. But perhaps the versatility of Giovanni's genius appears to greatest advantage in the elaborate bas-reliefs executed for the gates of the Duomo of Pisa, known to every art student. The models for this vast design were completed in a few years by the all but octogenarian master, with the assistance of his three favourite pupils, Franqueville, Tacca, and Susini.

DEFECTIVE BEDDING OF COLUMNS.

ON the 16th inst. the roof of the Kingston Mills, at Stockport, belonging to Micholls, Lucas & Co., Limited, fell, and five men were killed. An inquest was held which, after adjournment, was resumed on Wednesday for the hearing of technical evidence.

Mr. E. Micholls said that he and Mr. Salomons had the general superintendence of the Kingston Mill. It had been necessary to make alterations in the internal construction of the mill, and in the course of those alterations the engine had to be removed from the old engine-house. The engine-house extended right across the mill, with the exception of a staircase, and was four storeys high. The walls of the engine-house had to be removed, and in order to support the new floors and roof, columns and beams were inserted in place of the old walls. The work was carried on under the general superintendence of the architects, Messrs. Potts, Pickup & Dixon, of Manchester and Oldham. The iron work was supplied by Messrs. W. Milburn & Sons, of Stalybridge, and the builder was Mr. S. Robinson, of Hyde. When the accident happened the sixth or top floor was very nearly finished, and the fifth floor was being proceeded with. On the day of the accident the fixing of the ironwork was nearly completed, and some of the men were engaged in taking down the walls. On that day—the 16th instant—he (Mr. Micholl), arrived at the mill about half-past nine o'clock in the morning, and remained until noon. About ten o'clock there was a noise heard in the mill, and he was informed of it by the manager (Mr. Hart), who said, "There has been a noise, and I am just going to tell the men working in the engine-house to go away and not to commence work again until the cause of the noise is discovered." The clerk of the works (Mr. Todd) was then sent for, and told to go round and try to find out the cause of the noise. In about half an hour Mr. Todd came back into the office and said he had discovered that one of the columns had "bedded" itself in its socket, and a bit had been broken off it. He (Mr. Micholls) then asked Mr. Todd whether the work was safe, and Mr. Todd replied that he had been clerk of works for about thirty years, and he had never seen any safer building. Witness then went to Mr. Hart to inspect the column, and he also inspected the other parts of the works. He made an examination of the whole of the ironwork, and Mr. Hart pointed out to him that one of the brick arches on the top storey of the mill, which had been put in by Mr. Robinson, the contractor, had settled a little. Witness got up on a ladder and saw that it had done so. He shortly afterwards left the mill and came to Manchester. Shortly before two o'clock he received telephonic information of the accident, and at once returned to Stockport. When he arrived at the mill he found that the whole of the ironwork had given way, and the roof of the mill had fallen. Several people had been taken to the infirmary. Mr. Clegg, architect, of Manchester, was called in the next day in order that an independent witness might see the ruins, exercise his judgment, and ascertain for himself the cause of the accident. Witness himself never interfered with the fixing of the ironwork, nor did anyone on his behalf.

Mr. J. A. Hart, the manager of the mill, then stated that since

the alterations were commenced he had never heard any workman complain of the dangerous character of the work. He had heard the architect tell the men to use every possible care; and on one occasion when Messrs. Milburn & Sons' foreman was away, the men were told to stop work, and a telegram was sent for the foreman to return. On the day of the accident, about eleven o'clock in the morning, he (witness) was standing in the room on the fifth floor, directly over the engine-house, and he saw the men running away from the place where they were then working. He heard no noise, and did not feel any shaking motion. He asked the men why they were leaving their work, and they replied that they had heard a noise as if somebody had been moving a heavy weight, apparently in the room above them. He then went upstairs to the sixth floor and asked the men there if they knew anything about the noise. They told him that they had felt the place shake, and had heard a noise as if someone had been moving a heavy weight, and it sounded to them as if it was on the roof. Witness then returned downstairs and told the men that all work must be stopped until the origin of the noise had been discovered. About twenty minutes afterwards Mr. Todd, the clerk of the works, entered the office, where witness then was, and brought a piece of iron off the bottom of a column, and said that one of the columns had "bedded" itself and that piece had been broken off. Mr. Micholls, who was present at the time, asked Mr. Todd if he considered the building safe, and Mr. Todd replied that he did. Mr. Micholls and witness afterwards inspected the column, and everything appeared to them to be safe. When the accident happened he (witness) was at dinner, but on hearing of it he at once went back to the mill. The piece of the column which was broken off was about two and a half inches wide and from three to four inches long.

Mr. E. Potts, of the firm of Potts, Pickup & Dixon, architects, Manchester and Oldham, said that he had had twenty-three years' experience as an architect, and during that time he had taken part in the erection of a large number of mills. He had also carried out many alterations like those at the Kingston Mills. Mr. Todd was the clerk of the works appointed by the proprietors of the mill. The first contract for the entire work, with the exception of the old engine-house, was with Mr. Robinson, of Hyde. Subsequently a separate contract was made with Messrs. Milburn & Sons, for the whole of the ironwork required in connection with the removal of the walls of the engine-house. Messrs. Milburn & Sons executed the whole of the fixing of the ironwork. He himself was not aware that any of the beams or columns were tested in any way before being placed in position. A man named Bateman was placed in charge of the fixing of the ironwork by Messrs. Milburn & Sons, and he was told that he was not to leave until the work was completed. On February 8, however, witness went to the mill and found that Bateman was away from the works. Witness thereupon telegraphed and wrote to Milburns, and Bateman returned on the following day. Witness visited the mill once a week, and made a careful examination of the whole of the works. He never had any fault to find with any of the workmen except the man above referred to. As the work proceeded he suggested alterations for attaining greater strength and security. One of those alterations was that a tie rod should be placed from one column to the other, but this had not been done before the accident occurred. The strength of the beams was also increased at his suggestion. The last time he was at the mill prior to the accident was on Thursday the 8th inst., and then the columns in the old engine-house as well as all the beams, had been placed in position, and the wall of one storey had been removed. He at that time made a very careful examination of the pillars and beams of the top storey when the supporting wall had been taken away, and he was of opinion that everything was perfectly safe. On Friday the 16th inst. he received information of what had happened, and he came to Stockport at once. He saw that the place had collapsed, and was informed by Mr. Hart of what had happened to one of the columns. He observed that one of the pillars left standing in the walls had an exactly similar fracture to the one spoken of by Mr. Hart. He then made a careful examination of the ironwork so far as could be seen, and he found that the swell of the boss where the tie rod went through the pillar had been too high, and this faulty construction, in his opinion, was the cause of the accident. In his opinion the sudden shock of the bursting of the pillar bottom withdrew the support suddenly from the wall-plate or skew-back, thus throwing the whole of the weight on the arching of the roof upon the old skew-backs, a weight which it was never intended they should carry. In reply to the Coroner, Mr. Potts said that the cause of the accident was the pillars not being properly bedded. The man in charge of the fixing ought to have found that out. No outside person could have told that anything was wrong. Care should have been taken that the columns were properly fixed in their sockets. It was possible that the man in charge of the fixing might have been deceived by the pillar bottom only happening to rest on the projection on one side of the pillar, not on the other. This might have been avoided by the socket and rod being fixed previously. If a careful examination had been made of every one of the pillars, the accident would never have happened.

The inquiry was then adjourned.

MANCHESTER ACADEMY OF FINE ARTS.

AT the quarterly meeting of the Council of the Manchester Academy, held on Tuesday evening at the Royal Institution, a communication was read from Mr. Joseph Knight expressive of a desire to rejoin the Society. Mr. Knight was unanimously re-elected a member. Mr. J. Yates Carrington was elected a member, and the following gentlemen were elected Associates of the Academy:—Z. Pritchard, J. B. Lethem, H. Hardy Simpson, and Alfred Goodfellow. After the elections, the important subject of the anomalous position of the lady exhibitors was discussed, and a feeling was expressed in favour of abolishing the title of "Lady Exhibitor" by putting the ladies on an equal footing with the gentlemen, and making them eligible for both associatship and membership. The consideration of this alteration in the constitution of the Academy, as well as some minor alterations of the rules, was adjourned to a future meeting. The question will have to be finally decided at a general meeting of members.

MANCHESTER CATHEDRAL.

A MEETING was held in Manchester on Wednesday to consider the proposed restoration of the Cathedral. The mayor presided. An abstract of the report of Mr. J. S. Crowther, architect, was read, and it referred to the dangerous condition of certain portions of the Cathedral, and the consequent necessity for undertaking the restoration.

The Bishop of Manchester moved—"That this meeting of citizens and parishioners of Manchester, having heard the report of Mr. J. S. Crowther, architect, as to the structural condition of the nave and such other portions of the Cathedral and Parish Church of Manchester, for the maintenance of which the Chapter revenues are not available, is of opinion that measures should be immediately taken to carry into effect the recommendation of the said report." He said the resolution presupposed a certain amount of acquaintance on the part of the meeting with the arrangements of the present church, which was now known as the Cathedral Church of Manchester and the diocese, which were very special in this particular case. He did not know, in fact, that there was any other cathedral in England occupying exactly the same position as the Manchester Cathedral. It was still a parish church; it had still its churchwardens and vestry meetings; there was a certain portion of the fabric for which the churchwardens, as representatives of the parishioners, were supposed to be liable, and there was only a very limited portion of the fabric of the choir which was maintainable out of the caputular revenues. And these, as they knew, had been dealt with in a very special way. There was an Act called the Manchester Parish Division Act, which was passed in 1850, and which laid down the principles upon which those revenues were administered, and the purpose for which they were applied. The particular part of the Cathedral which was described in the report, written by a most competent architect, a man perfectly qualified to judge of the matter upon which he reported, was represented to be in a critical and dangerous state; and when they realised the fact that there were sometimes at Sunday evening service as many as 2,000 people present, and when this statement was made that the building was in a critical and dangerous state, he thought they would agree with him that the time had come when it was necessary to take some decided steps to remove the danger. It was astonishing, no doubt, what was done and permitted in the name of restoration seventy or eighty years ago. What their grandfathers could have been thinking of when they laid all those coats of Roman cement, having first chipped the masonry basis until, as the architect said, in some places the bearing stones, less than five inches, carried the whole weight of the roof, it was almost impossible at the present time to conceive. He did not mean to say that all modern restorations were satisfactory, but it was a matter to be rejoiced over that they were seeking not to improve the original design of the fabric, but to restore it as nearly as possible to the condition in which it stood when it came from its designer's hands at first. It was hoped, therefore, that no one would suppose they were going to turn out a brand new thing and call it restoration. They were going to place the Cathedral as it stood there some centuries ago. He did not know whether Manchester people regarded it more as Cathedral or Old Church, but he confessed the old title had an attraction for him which the new title did not possess. The building did not quite represent to him a cathedral, but something very much better. The cost of the restoration was estimated at 30,000*l.*, and he did not think that was at all an extravagant sum to expect to raise. He believed the general volume of wealth in the district was larger than ever before, and he wanted to see all their institutions rest not merely on the liberality and wealth of a few but upon the generous support and sympathy of the many.

Lord Egerton of Tatton, who seconded the resolution, said the Old Church of Manchester was one of the most ancient and one of the few links which connected Manchester with the mediæval past. If Sir John Lubbock and others who thought with him could be enthusiastic about the preservation of Stone-

henge and other ancient temples, he thought the citizens of Manchester would desire to preserve a building which was so closely associated with the past history of this country. With regard to the spirit in which the work was to be done, he was glad to hear it was to be done in a conservative spirit. He understood that it was the intention to follow upon the ancient lines of the old parish church. Against any restoration not carried out upon that principle he had always entered his protest. It was resolved "That a public appeal be made in the ancient parish of Manchester and the diocese generally for the purpose of raising a fund of not less than 30,000*l.*" The sum of 13,224*l.* was announced as having been promised.

THE PALACE OF THE POPES AT AVIGNON.

A CORRESPONDENT of the *Daily News*, writing from Avignon, says:—"Many of your readers will, I feel sure, be glad to hear that the French Committee for the Preservation of Historical Monuments has at length succeeded in making an arrangement by which the Palace of the Popes in this interesting old city will shortly cease to be used as barracks for the garrison. This act of vandalism dates from the first year of the reign of Louis XVIII., and since that time much irreparable damage has been done to the frescoes, while many of the rooms have been disfigured by whitewash. Party-walls have been knocked down in some places, and wooden partitions run up in another, and despite all that has been done the palace has not, as may readily be imagined, been at all comfortable as military quarters. Remonstrances against the barbarous use to which this historical building was being put have been made from time to time for the last fifty years, and just before the fall of the Empire it seemed as if the scandal would shortly cease, for some new barracks were built for the garrison close to the station. But just as they were ready for occupation the war with Germany broke out, and after it was over the French pontoon corps, whose headquarters were formed at Strasburg, was sent to Avignon to do their exercises upon the Rhône, now that the Rhine was no longer available. So the ordinary garrison perforce remained in the Papal Palace, and some fresh arrangement had to be made. M. Viollet le Duc, the eminent architect who restored the ramparts of Avignon with so much ability, did his best to obtain the consent of the Minister of War to the erection of fresh barracks, but he died before anything was settled, and the Committee for the Preservation of Historical Monuments has experienced great difficulty in extracting a definite promise. This promise has, however, been given, but the palace will not be evacuated until the new barracks are finished."

The Street Memorial.

SIR,—May I appeal to all who love and honour Street's memory to help towards completing his memorial by Mr. Armstead in the Great Hall of Justice. The complete design includes a statue, with an appropriate and symbolical pedestal. But for the latter our means are still deficient. At the recent committee meeting, however, we resolved, on the motion of the Prince of Wales, not to acquiesce in a half success, but to make a vigorous push to fulfil our work in its completeness by raising the still needful 600*l.* Our friends' contributions should be sent to the treasurer, A. Waterhouse, Esq., 20 New Cavendish Street, W.

Very faithfully yours,

A. J. B. BERESFORD HOPE.

The Ipswich Competition.

SIR,—As a young man who is obliged to go in for competitions, both as a means of showing what he is capable of doing and also as a wise precaution against getting rusty, I should like to add to Mr. Christian's letter. Mr. Christian says that the response to the invitation for the above is appalling. Might I suggest that for all men who, like Mr. Christian, love Gothic architecture, this great response, even for so poor a church, is a matter of sincere congratulation, for is not church building to the Gothic architect the very height of his ambition? And certainly to build a cheap church that is to be a beautiful building is a difficult task, requiring much thought, for effect can only be produced by plans, proportions, and the form and arrangement of window and door openings.

As regards competitions, I think two rules are generally acknowledged. First, if the competition is to be decided by the committee alone, then it is a waste of time going in for it unless you have great influence among a considerable number of the committee; and also that any means to gain over a sufficient number of the committee to vote for your design is allowable, all being fair in love, war, and competitions of this class.

Secondly, if a professional referee is to be appointed, make

every inquiry as to who he is, and whether his award is likely to be adhered to; and if you are satisfied then do your best. In this Ipswich instance the clergyman's name almost was sufficient guarantee he was backed up by names on the committee whom everyone could trust. Hence the result.

Would that more often a cheap church was put up to competition; we should not have so many vile, ugly erections, worse in their hideous forms and detail than the vilest of jerry-builders' concoctions.

Might I add another word; that is, when a certain surveyor who has talked and written much about competitions conducted under a professional referee is known to be the judge, I would advise men to think twice before going in for that competition.

I remain, yours truly,

9 Argyll Street, W.

SYDNEY VACHER.

SIR,—Mr. Christian's letter in your last is very straightforward and so far satisfactory, but the impression it leaves on the mind of a general reader is that there is something that ought to be looked into as regards the origin of the competition. It cannot be disputed that the introduction of a highly-respectable name like Mr. Christian's into such a transaction confers upon it a sort of substantial respectability which it might not otherwise possess; and I cannot help asking whether this ought to be allowed by Mr. Christian himself except upon proper inquiries. Suppose the case of a competition instituted upon false pretences altogether, but bolstered up by the appointment of a first-class architect as "assessor." Is such a gentleman to rest satisfied with performing his task, for no matter whom, for the mere sake of his fee? After all, he might, perhaps, never get it; and would it not serve him right in such circumstances if he never did? On the other hand, if Mr. Christian, before entering upon his work of adjudication, were to ask for full explanations of the motives and means of the promoters, and, failing to find these satisfactory, were to refuse to lend his name to the business, I am inclined to think no one else would take it up, and the cause of fair dealing might be not considerably well served, even if the temper of the parties were a little ruffled.

In the present case we have a local paper describing the competition as one for a church *in nubibus*; and if this is really true, and the promoters have represented it otherwise, are they not liable for the trouble they have given, and would it not be better to let the competitors at once withdraw from such a contest and claim compensation *pour encourager les autres*?

I am happy to be able to sign myself,

NOT A COMPETITOR.

ARCHÆOLOGY.

American Explorations at Assos.—The Bulletin of the Archæological Institute of America for January 1883, according to the *American Architect*, gives evidence of great activity on the part of its agents, as well as of the increasing public interest in the matters with which the Institute deals. The explorations at Assos, under Messrs. Clarke and Bacon, have progressed steadily; and although the Bulletin only mentions results very briefly, the editors preferring to leave detailed descriptions for the special report, it is evident that many interesting discoveries have been made. The platform of the Stoa, that picturesque and stately promenade above the town, overlooking the bay, has been excavated with great care, and the remains of the Agora, or market-place, the council-hall, a bath-house, and an adjoining temple have been exposed, measured, drawn, and photographed with such success that, in the words of the Bulletin, "it seems probable that when the work is completed the remains at Assos will not only present the most perfect idea of a Greek city that is anywhere to be obtained, but will afford a better insight into the life of an antique city than is to be gained even from the streets and houses of Pompeii." The Street of Tombs has also been the subject of special investigation, and many fragments of sculpture, with minor works in terra-cotta and metal, have been found, together with several interesting inscriptions, one of which records the burial of the Archon Basileus and of the Basilinna, his wife, showing that the institution of the archons, established in Athens after the downfall of the tyrants, was closely imitated in the colonial city across the Ægean. Although not, perhaps, the most interesting, the most important discovery in some respects is that of works of fortification belonging to at least six different epochs, all in a state of preservation which permits their complete restoration. Like the stone bridge below the city, the only example of such a structure of Grecian workmanship which has ever been discovered, the fortifications at Assos are in many respects unique; and Mr. Clarke is probably right in believing that, as showing the consecutive development of masonry during the whole classical period, they will be henceforth the standard by which the date of all Hellenic walling of historical times will be determined.

A Design by Mr. Mountford has been adopted for the new infirmary at Stratford-on-Avon.

GENERAL.

Mr. McBrair, of Oxford, has been appointed city surveyor of Lincoln.

Mr. J. Young, of Devon Street, Glasgow, has obtained the contract for the western section of the Glasgow City and District Railway.

Mr. J. W. Tonks will read a paper on "Architectural Revivals" at the meeting of the Birmingham Architectural Association on Tuesday next.

Tidal Baths are about to be erected at Ramsgate, from the designs of Mr. A. R. Pite. The semi-circular roofs, gallery, and other ironwork will be constructed by Mr. A. D. Dawney.

Mr. W. Leiper delivered the first of a course of lectures to the members of the Glasgow Architectural Association on Tuesday, the subject being "Architectural Rambles."

Mr. James Smart, of Brechin, has given 500*l.* towards the foundation of a scholarship in connection with the Engineering Chair in the University College, Dundee. The scholarship is to be open to general competition.

The Marquis of Bute has presented the Cardiff Free Library with a complete set of the books, maps, memoirs, drawings, and other publications issued by the Palestine Exploration Fund.

The New Courts of Justice have cost 1,846,683*l.* The original estimate was about 1,500,000*l.*, but the revised estimate was 1,933,000*l.*

A Chancel, which was constructed from the designs of Mr. Norman Shaw, R.A., at a cost of about 2,500*l.*, has been added to the church of St. Michael's, Bournemouth.

A Stained Glass Window, which was designed by Mr. Westlake, F.S.A., has been placed in the Roman Catholic Cathedral, Newcastle-on-Tyne.

The Dundee Gas Commissioners have, subject to certain conditions, given the lighting of the town for a series of years to the Brush Electric Lighting Company.

Society of British Artists.—At the general assembly of the Society of British Artists the following gentlemen were elected members:—J. Adams-Acton, Leslie Thomson, and A. W. Weedon.

Royal Society of Painters in Water-Colours.—At the general meeting held on Monday, Messrs. John Burr, H. G. Glindoni, Frank Holl, A.R.A., Edward J. Poynter, R.A., and W. J. Wainwright were elected associates.

The South Kensington Museum was on Monday visited by 34,603 people. Last year the number was 32,818. At the Bethnal Green Museum the number was 6,930, an increase of 270.

A Convention between the Municipality of Rome and Messrs. Baring & Hambro, of London, for 15,000,000 frs. towards the loan being raised for city improvements, has been signed.

Mr. G. E. Wright, F.S.A., announced at last week's meeting of the British Archæological Association that the course of the intended railway from Portsea to Bristol, designed to pass through the Avenue and the Cursus of Stonehenge, had been modified to avoid those interesting objects of antiquity. It was also reported at the same meeting that Earl Granville had been elected president of the Association.

The Sheffield Town Council on Wednesday adopted the report presented by Mr. Gatt, of Bradford, the borough surveyor, providing for the complete sewerage of the roads with outfalls. At Blackburn, about three miles below the town, twenty-three acres of land have been obtained, and on the site it is proposed to erect works for dealing with the sewage on the precipitation system, the effluent to pass into the river Dan. The cost of the scheme is estimated at 150,000*l.*

Ventilation of Public Buildings.—Messrs. Robert Boyle & Son, of 64 Holborn Viaduct, are at present applying their system of ventilation to Westminster School and Ashburnham House, Westminster; Boys' Home, Regent's Park; new Public Offices, Kimberley (Cape Colony); new Somerset Hospital, Cape Town; Wesleyan Garrison Chapel and School, Malta; and "Fairhill," Tonbridge (Kent), the seat of the Earl of Derby.

Eugène Delacroix's picture, *The Shipwreck of Don Juan*, for which the sum of 12,000*l.* was offered some years ago, has been presented to the Louvre by Madame Moreau, the widow of a well-known connoisseur, on condition that her husband's name be retained on the frame, and that the picture be not hung among the modern works upstairs. The picture was first exhibited in the Salon of 1841, and later on at the Exhibition of 1855.

Mr. Alfred Clint, late president of the Society of British Artists, died on the 22nd inst. at the age of 76, after having ceased for about five years to exercise his profession owing to failure of sight. He acquired his technical knowledge of painting from his father, George Clint, then A.R.A., and he studied the living figure along with other members of a society of students in the Savoy. After trying portrait and landscape he fixed on marine painting. He was one of the original members of the Society of British Artists, which was formed in consequence of a belief that the Royal Academy did not give sufficient space on its walls to landscape painters. After exhibiting in the Suffolk Street Gallery from its first opening, he succeeded Mr. Hurlstone as president, and on retiring was made honorary president.

SUPPLEMENT

TO THE

ARCHITECT

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MARCH 31, 1883.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK,
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

THE ARCHITECTS' BENEVOLENT SOCIETY.

CHARITY ORGANISATION is said to fulfil its purpose fairly well; but it is to be hoped it will never supersede that exceedingly genial, because so peculiarly fraternal, kind of almsgiving which our trade and professional "Benevolent Societies" represent. Political economy, that is to say, social philosophy and the rest of their category of advanced

scientific mysteries made plain, must not be allowed, however admirable they are in themselves, to sweep away entirely that more emotional philanthropy of "the tribe," in its form of "the craft," which is the nearest approach in the world of affairs to the love of the family.

Amongst other institutions of this description there has existed in London for the last three-and-thirty years one which bears the name of the architectural profession—*The Architects' Benevolent Society*—of whose operations we last week gave a few brief financial notes, as our readers will remember, in announcing the intention of Mr. WHICHCORD, who holds the office of President of the Society, to bring before the Institute of Architects next Monday some information on the subject, and, as we understand, some further proposals for its encouragement.

That the architectural profession of Great Britain and Ireland ought to possess such an institution at the present day is, on the face of the thing, scarcely necessary to be proved; and it is a somewhat remarkable fact that the initiation and growth of the Society before us can be shown to correspond, in point of date, so closely with the growth of the need for it, that this of itself seems to afford as good evidence as could be desired in favour of the substantial and serviceable character of the enterprise. Thirty years ago, as our senior men will readily remember, the architects of England, although much more numerous than they used to be, were beginning to advance in numbers rapidly. The impetus which was given to all kinds of artistic and scientific business by the great International Exhibition of 1851 was beginning to tell at once upon business architectural. The good taste of the public had been started on a new career in building, as in all else; provincial architects, as they were then called in a more distinctive way than now, were establishing themselves, in smaller towns as artists of pretension; minor practitioners, as a rule, were acquiring greater professional weight; the Royal Institute of Architects was beginning to aim at embracing the whole profession in its lists; the Architectural Association had been some years established, essentially as an educational venture; young men were entering the offices of all sorts of architects, nominal and real, as enthusiastic pupils; and in every way the foundation was being laid for a large British confraternity of well-equipped architectural men of business, which should extend its influence in good earnest, as it is now so conspicuously doing, throughout every corner of the country, wherever church or chapel, school, mansion-house, parsonage, or even wayside inn or street-front, has to be designed with care as a matter of local interest. It was at that very time, accordingly, that the Architects' Benevolent Society was established, as if in immediate anticipation of the need for it (for with increase of prosperity there must come in this world increase of misfortune—the more the success the more the failure), the capital stock at the end of its first year of existence being equal to 30*l.*, and the total of distributed benefactions at the end of its second year, the year 1851, just 10*l.* and no more. The growth of the undertaking since then has been slow but steady, until the returns for the year 1882 show capital stock 5,336*l.*, and the year's pensions and grants 527*l.*, of which latter amount 370*l.* is contributed in the form of annual subscriptions, and the remainder derived from dividends. The expenses of management charged to the fund are at the same time entered at so moderate a figure that the total is only 14*l.*; and this satisfactory circumstance leads us to notice, lastly, that the Institute has recently assumed the place of chief contributory, in a most commendable and indeed graceful manner, by taking

in hand the whole of the secretarial work free of expense, including, in effect, even the cost of printing and stationery. Taking these figures, then, as a whole, and being able as we are to intimate that the work of the charity is done with almost too scrupulous delicacy and privacy, we need scarcely suggest that the amount of benevolence effected is very considerable, although still unequal to cope with the growing necessities of the occasion.

It may interest the reader to be informed how far he is quite correct if he supposes that the principal supporters of a professional Benevolent Society will not be found to be always identical with the great leaders in artistic fame. The names to be applauded as donors to this thoroughly practical institution are often those of very practical men. First comes the late Mr. JOHN JOHNSON, the estimable and able designer of the Alexandra Palace, who bequeathed 1,000*l.* to the fund in 1879. Another architect, of less celebrity, Mr. PALGRAVE, having more recently appropriated an equal sum to the cause by a codicil to his will which he did not live to sign, it was left to his two nephews as residuary legatees to fulfil his wish on their coming of age, and one of those gentlemen having accordingly done so within the last few months, takes the second place on the list, to his own great credit and the due honour of his ancestor's memory. Following these, although at a very considerable interval, come in order Mr. T. H. WYATT and a Miss RATRAY; then the well-remembered names are seen of Messrs. MOCATTA, C. C. NELSON, DECIMUS BURTON, and SALVIN—these being good friends deceased; whilst at the head of those still living we have Messrs. CHRISTIAN, GEORGE GODWIN, GOOD, BOULNOIS, MAIR, and WATERHOUSE. If without invidiousness we may quote with honour a few of the next succeeding names, they will be those of Dr. PHENÉ, Messrs. H. JONES, T. H. LEWIS, C. BARRY, ANDERSON, TURNER (the excellent honorary secretary for twenty-five years or more, now deceased), PORTER, SCAMELL, BARLOW, CATES, BRANDON, DEVEY, and WHICHCORD, with the late Sir G. G. SCOTT, Sir DIGBY WYATT, Sir W. TITE, Mr. SYDNEY SMIRKE, and Mr. R. L. ROUMIEU. This short list is at least long enough to warrant us in congratulating the Society upon the breadth of its basis as regards individual support; and although, when it is often remarked that architects are not so free as many other people with their money, no doubt there is some good reason for it if it were worth seeking out, we may also, perhaps, be permitted to congratulate these individual supporters whose names we have presumed to mention, upon the honourable position which their liberality confers upon them in a cause so generous and kindly.

Amongst those whose personal exertions have been most warmly devoted to the establishment and advancement of the charity, we ought to place foremost Mr. JOHN TURNER, as having so long done the duty of the secretaryship and general management; Mr. SYDNEY SMIRKE, the president for more than twenty years; Mr. GEORGE MAIR, the present treasurer; and Mr. T. H. WYATT, who was the means of a well-directed appeal being made to the profession some four or five years ago, which resulted in a very considerable augmentation of the amount of invested capital. We hope Mr. WHICHCORD, in now taking up the work of Mr. WYATT, may meet with even greater success.

The ground upon which the professional brotherhood at large is especially urged to take into consideration the claims of this charity is stated to be the fact—which surely requires explanation—that out of the 1,100 architects in more or less comfortable circumstances (we trust we may say with not too many exceptions) who constitute the Royal Institute of British Architects, the annual subscribers (distinguished from compounders or "donors") number no more than 226. According to COCKER, so to speak, there ought surely to be, say, at least 500 more; and that the guineas of so many additional friends would form a most welcome increase to an income which is now, as we have said, only a little over 500*l.* *per annum*, is of course sufficiently plain.

We do not pretend to be able to advise the directors of the Society how to improve upon their system, but all the world knows how such work is *quasi*-scientifically done, and we may be permitted to mention two or three well-known means of obtaining funds which may possibly be worth trying here.

First, it is always advisable to circulate such statements of the actual work that is done from year to year as shall show a good reason for the support of the cause. Names and addresses are, of course, not to be published; but general

particulars of cases, with the amounts of benefactions granted, can be given in such a way as to excite approbation and sympathy, without transgressing in the slightest degree the limits of delicacy. We do not remember having seen such details of the current beneficence of this charity, and there can be no doubt that the publication of them would of itself be worth a considerable addition to the subscription list.

Half-guinea subscriptions have been of late years more encouraged than they used to be; and few facts are more remarkable in the science of collecting money than the increased readiness of the English public to contribute small sums. Almost anyone could subscribe half a guinea to this Society.

There is only one other proposal we have to make, and it is simply the establishment of the customary annual dinner. It is no secret that this is the very sheet anchor of scores of our public charities. Why should not the festival of the Architects' Benevolent Society be the annual convivial assembly of the architectural profession—the great dinner of the Institute, of the Association, of the Conference, of the Picts, Scots, Nomads, Fabs, and what not besides in the way of brotherly nobnobs? With a prince, a cabinet minister, a great building noble, a poet occasionally, even a bishop or a cardinal in the chair, and a fair glass of wine on the table, to say nothing of a cigar and a song, why should not the cash come rolling in as pleasantly to this as it does to so many other benevolent societies?

M. J. BASTIEN LEPAGE.

[BY A CORRESPONDENT.]

THE residence of M. BASTIEN LEPAGE in the Rue Legendre is devoid of pretension. The *atelier* is plain and workmanlike, with a single embellishment, which is, however, replete with historic interest. In a poor *bottega* on one of the smaller canals of Venice, M. BASTIEN LEPAGE discovered the sculptured woodwork, in Byzantine style, of a small chapel. Its possessors informed him that it had been in St. Mark's till some 250 years back, when a family inscribed on the *libro d'oro* purchased the privilege of erecting a costly private chapel within the *duomo*, now in the course of rebuilding. M. LEPAGE acquired the relic and sent it home. Some months later, while searching among ancient Italian engravings in the Galerie des Estamps at the Bibliothèque Nationale, M. BASTIEN LEPAGE found the prints of the sixteenth century in which this identical chapel is accurately represented. The carving on the small altar and on the spiral columns is uninjured.

On easels in the middle of the studio, at the time of our visit, were two large-sized water-colour drawings, which were a revelation of the skill of the artist as a landscapist. It might almost be said they are the creation of a poet as well as of a painter. In *Sunset* we have a scene of extraordinary effect. Before us is a vast expanse of firmament. Clouds like the waves of a wild sea heave and roll in dark masses, while an indescribable light of pure rose breaks from between the barred clouds, intensified to a scarlet halo, which streaks the central heavens in keen flashes brighter than lightning. This blaze of gorgeous colour is produced by the setting sun. Below stretches a grass-covered plain; over its level surface the shades of night are fast gathering. Two labourers, shadowy in the half light, hastily collect their implements and hurry homewards, for the clouds are laden with rain, which will fall as soon as the sun sinks below the horizon. The sense of immeasurable depth of skyscape is given by imperceptible gradation of grey-blue tones. M. BASTIEN LEPAGE has in fact depicted a momentary action of nature which he observed one evening as he was returning to his country home in Lorraine.

In *Le Colporteur* we have another expression of this artist's careful study of the varying aspects of the heavens, to him more fascinating even than the ocean surface. This drawing expresses somewhat fiercer manifestations of elemental energy than *Sunset*. Tossing clouds, rushing wind, waving curtains of rain, foretell the coming tempest. Small wonder is it that the thinly-clad colporteur huddles his grey coat closer round his lank form, and hurries along the wet and slippery road, while skirts a common overgrown by poor, stunted grass, broken here and there by ragged shreds of rock. The pitiless storm drives him onward. It is indeed "chill October."

Scattered mists, floating towards the North, will presently gather in masses as dark and dense as are depicted in the companion picture. But it is midday, and, desperate as is the weather, light fills the landscape. The salient feature of both these works is the rendering of moving mist, flying clouds and coming storm.

A carefully-executed small likeness of M. *Emile Lepage* recalls, in tone, finish, and correctness, the portraits of *Sarah Bernhardt*, of *M. Albert Wolff*, and of *H.R.H. the Prince of Wales*. In the treatment of the head there is the same patient research and the same minuteness of detail; in the drawing of the hands, which rest on a map, spread on an oak table, the same finish and precision. The attitude of the figure, simply clad in grey, is easy and natural; the fidelity of portraiture striking. The background is partially hung with grey-green plush. The woodwork of the table is remarkably rendered; a refracted light falls on it with curious effect. Next to this small picture hangs an admirable likeness, in *repoussé* bronze, of M. *Bastien Lepage*, by SAINT GAUDENS, an American artist of great talent. Fair, slight, of middle size, M. BASTIEN LEPAGE is almost boyish in appearance. An intense student of nature, his home and working *atelier*, at Domvilliers, in Lorraine, have more attraction for him than his house in Paris, which he merely considers as a *pied à terre*. In his native Lorraine, where his family reside, he secures absolute seclusion, and there he works safe from interruption. With a laudable pride he pointed to a landscape, by his brother, of their home, on a rising ground, partly surrounded by an ancient orchard. The church, with its square clock tower, crowns the heights; beyond is a distant view of the town. Domvilliers is not far from the Argonne district, inhabited by a race of glass-blowers, on whose ancestors PHILIPPE LE BEL, in 1448, conferred a charter, conveying to them the right to blow glass, and granting them exemption from taxes, *gîte et chevauchée*. HENRY IV. confirmed and renewed this charter. The inhabitants supply France with bottles to this day. It was in the studio at Domvilliers that the picture was painted which M. BASTIEN LEPAGE has sent to the Salon. The title is *L'amour au Village*, defined by a couple of lovers who inhabit contiguous cottages. Their gardens are separated by a paling. They watch each other through openings in the trees, each too shy to allow the other to perceive the ruse.

The attention of the public was first attracted to M. BASTIEN LEPAGE at the Salon of 1874 by a life-size portrait of his grandfather, which now hangs in his dining-room. The old gentleman has a Socratic cast of head; the expression of his countenance is rendered by that untranslatable term, "narquois"; the blue eyes sparkle with a kindly malice, the nose is broad, the lips are ready to utter a humorous repartee. The beard of silvery whiteness falls on a vest of the tone of dead leaves; a handkerchief of grey-blue is spread on his knees. Thoroughly he enjoys the cool of evening beneath the old tree which overshadows him. Although in half-light, the shadows are projected with uncommon skill, without altering the subdued tone which pervades the whole work. The out-of-door atmosphere and faithful rendering of country life in the picture took the Parisian public by surprise. "I wish," said BASTIEN LEPAGE, "to represent genuine country life in all its phases. The public in Paris are accustomed to an opera comique representation of it."

In his own apartment the artist has hung the portraits of his father and mother. He has painted Madame LEPAGE as he is accustomed to see her—clad in soft grey, her summer hat by her side, and seated in her garden. The likeness must be good, as it bears a striking resemblance to her son. An earnest, searching glance, an indefinable expression of goodness in the mouth, and, if one might commit an anachronism, an attitude expressive of cordial greeting, are given with distinct individuality. There is in all these portraits the same subdued tone, observable in the *Mendicant receiving Alms*, exhibited two years back, and in the *Boy in the Wood*, as also in the *Girl with Flowers*. We fain would crave a higher note of colour, but M. LEPAGE has his own theory of art, which would in that case be radically altered.

The country, with life in the woods, is his ideal. He neither exaggerates nor poetises nature's aspect under whatever phase he delineates it, but he renders the scene he undertakes to put on canvas with earnest and scrupulous fidelity. The peasant child, who holds the primrose she has gathered in the wood shyly behind her, gazes at you with the nervous inquiring glance of a country child unaccustomed to strangers.

The forehead is low, but does not lack intelligence; the hazel eyes, with overhanging lids, have a somewhat *farouche* expression; the square chin indicates the hard-working race whence she sprang; the wide mouth is half open, the poor frayed garments are dull in colour and coarse in texture, yet, spite the lack of beauty in a plastic sense, an underlying sentiment is expressed in the child's figure, and even by the depth of forest behind her, which has a strange interest. "We have too much painting," remarked the artist, "of a merely amusing type. It makes no impression on the mind, because executed without conviction. It is our duty to strive to render 'Cet intime rayonnement des êtres et des choses, qui est le vrai beau'; in a word, he added, "we must return to the principles of the old masters, and paint with sincerity and faith."

Born in 1850, at Domvilliers, M. BASTIEN LEPAGE has remained true to his native province. His compatriots are proud of his success, as they may well be. It is the dream of his life to do credit to their enthusiasm. Love for his family is as marked a feature in his character as his attachment to his native place. The happiest event of his life was the reception of his *Portrait du Grandpère* at the Salon. The following year he exhibited with equal success those of his mother and father. Strange, is it not, to note that BASTIEN LEPAGE, essentially the delineator of peasant life, made his *début* at the Salon by a pastoral scene in the style of WATTEAU?

La Petite Communicante and *The Portrait of M. Hagem* were exhibited at the Salon of 1875. The former represents a young girl of some fourteen summers, enveloped in veils and draperies of snowy whiteness. One might compare her to a peach, half-ripened by the sun, on which there still remains the *duvet*. The child's faith is evidenced by her earnest gaze, which, however, has none of the soft ecstasy of a saint. Here is the unquestioning faith of a child; transparent muslin falls around her, every fold finished with searching care. The background is a faint grey-blue. This little gem created a sensation, and M. LEPAGE refused to part with it. The following year he competed for the Prix de Rome. M. CABANEL, whose pupil he was, considered his success as a foregone conclusion. The Academy, however, reserves surprises for its victims, and *Les Bergers* did not carry the day. Disappointed, but not discouraged, BASTIEN threw himself with redoubled energy into the study of nature. He sympathises with peasant life, with its toil, its hardship, its privation, and conceived the idea he expressed to us of illustrating its various phases. He wishes to trace the peasant child of Lorraine, from its birth to its burial. As yet the pages he has given the world of these pictures of rural employments are *Les Foins*, *La Saison d'Octobre*, and *Le Mendiant*. There is something in the attitude of the reapers, in that of the sower in the act of casting the seed, reminiscent of biblical scenes; but we have no authority for attributing their peculiar character to have been derived from the sacred volume.

The artist has painted some portraits of Englishmen, and he descants with pleasure on the English character, and is grateful for the hospitality and friendliness he found in England.

SOME SPRING EXHIBITIONS.

CERTAIN pictures of very various schools now in the French Gallery, Pall Mall, would alone repay a visit to one of the best exhibitions held there for some time past. A brilliant example of the most brilliant manner of MADRAZO occupies a chief place. The subject—*Une Matinée Musicale*—shows the parti-coloured boudoir of some Spanish *artiste*, full of objects, stuffs, and furniture, gay as a flower-garden, wherein an easily-attired lady twangs a guitar accompaniment to her own song, while two *caballeros*, in full national costume, gaze and listen and forget to smoke the everlasting cigarette; a lady in a lace mantilla pauses at the piano; and an old *abbate*, half hid by a Japanese screen, drinks, in the scene with open-mouthed satisfaction. The *chic* of the dainty drawing and cunningly-cast situation is amazing as the dexterous harmony in audacity of the motley colour. The whole thing is a kind of artistic apotheosis of frivolity, and unsurpassable in its way. In utter contrast of subject and style is the pastoral by M. BILLET, *The Harvest of the Poor*. Once again a poem of rustic life is made out of a group of gleaners bending over the scanty leavings of the reaped corn. BILLET has cast upon the scene a lurid light from a sky of warm grey-blue and piled-up electric cloud. The figures stoop

this way and that in a radiated circle, with attitudes of hurried motion very skilfully suggested. The artist seems to have fallen, like so many, under the influence of M. LEPAGE, and to be leaving the tradition of BRETON, under which he started; but fortunately he has not yet lost the charm and tenderness which lifts his rustic themes out of merely realistic truth. The same cannot be said of M. LAUGÉE's *Les Choux*, the power of which is quite as indisputable as its unflinching ugliness. The projection from out the canvas of the head of the peasant-woman watering her cabbages reminds one yet again of the feats of M. LEPAGE. The emphasis fixed on the clumsy feet in sabots, the enormous strong hands, and the big watering-pot, are so many marks of the gospel of a certain French school, which will not allow us to pass through the outer husk of homely labour to its higher suggestion and meaning, but insists on the husk, which indeed it renders with an artistic verity that is startling.

The pictures of M. MIGNAN belong to another category; the study of a female figure called *Un Reliquaire* is a magnificent piece of colour—heavy greens and blues shot through with gold, gold ribbon in the dark chestnut hair, and Oriental blue on the background. The large picture, *La Repudée*, an exiled queen, with an old crone for companion, cast out upon a dreary landscape with her infant in her arms, has a fine poetic thought, the reflex of some sad old tale of long ago; but the artist mistakes slovenly work for grandeur, and has marred a fine conception by execution that leaves the picture inchoate. Below hangs the result of study that has shirked none of the laborious degrees that lead to completion, namely, the *Arab School*, by Professor MÜLLER, a capital example of his work. Mr. WALLIS has been fortunate in securing a number of sketches from nature, heads, landscape, and building, the material out of which this skilful Orientalist among painters constructs his vivid pictures of the land and people that "lie beneath the sun." The sureness of both hand and observation in these clever sketches is very notable. Another "feature" of the exhibition is the well known *Ferry Boat*, by TROYON, about which much has been heretofore written at various times. The beautiful luminosity of the picture has been marred by a coat of dirty varnish, which will of course have to be removed. This work, which is composed under the influence of the Dutch school of CUIJP, BERGHEM, and BOTH, but has qualities of refinement quite its own, is an example of the shifting favour of the public. The *Ferry Boat* now commands as many thousands in the market as some eight or ten years ago it fetched hundreds. The German school, if not so numerous present as of late, is well represented by the *Zither Player* of the famous Tyrolean DEFREGGER; the *Horse Fair* of VON BOCHMANN, the ladies in tasteful toilettes suitably surrounded, and painted in a supremely artistic way by C. KIEREL, and many good landscapes by HEFFNER, and others. A charming, if somewhat artificial landscape, with figures *Une Promenade sur l'Eau*, by the Parisian-Prussian M. HEILBUTH, takes the head of the room. Italy finds clever representatives in sparkling work by PASINI, PRADILLA, CORRODI, &c. The impressive manner of the Dutch painter, M. ISRAËLS, is lightened by humour in a study of *The Church-warden taken chez lui* with his worthy dame opposite him, as he smokes the domestic pipe over his official books. Altogether we are glad to congratulate Mr. WALLIS on an exhibition as full of interest as it is cosmopolitan in nationality.

In the same week which reopened the French Gallery in Bond Street, the Fine Art Society has inaugurated a little picture show, set forth with dainty surroundings of china, blue cretonne, and other devices, judged suitable for the subject matter, "pictures of children." This will doubtless prove a popular exhibition, for the names which stand in the catalogue are those of popular favourites. We must confess to have found very little that is most characteristic or fairest in childhood within the room; but, this important consideration apart, the gathering is sufficiently striking. Mr. MILLAIS sends a romantic young lady in fantastic costume, handsome and golden-haired, styled *The Captive*. The execution is closer and—must we say it?—heavier than we have seen before from Mr. MILLAIS. The picture is showy, and will make a popular engraving. Also destined for engraving, or already published, are Mr. LESLIE's delightful and thoroughly childlike little girl on *The First and The Last Day of the Holidays*; Mr. CALDERON's handsome boy, *The Captain of the Eleven*, standing radiant with frolic and health against a background of laurel; Mr. HERKOMER's *Grandfather's Pet*,

which retains its attraction; and Mr. ALLINGHAM's pretty water-colours, *In the Hayloft*, *The Children's Tea-Party*, and *The Little Customers*, which, when exhibited in the Water-Colour Society's gallery, drew down the approbation of Mr. RUSKIN and made sure the artist's repute. Mr. LONG, R.A., has put good work and some delicate flesh-painting into a portrait of a rather plain little fair girl in a black frock, *Little Maud*. Mr. JOHN COLLIER makes a clever full-length portrait of another little girl, also no beauty, but brightly intelligent, as she draws *A Sonatina* from her violin. Sir F. LEIGHTON's *Gasmunch* has the exquisite pearl and roses of his later flesh painting, and the graceful touch in the white draperies, though these are rather overmuch crumpled and twisted. About the *Babes in the Wood* of Mr. MORRIS, A.R.A., and the veiled baby called *Hilda*, by Mr. SANT, R.A., we would rather say nothing. Mr. ARCHER's sketch profile of a child holding wallflowers is one of the sweetest and most artistically painted things in the room, and Mr. MARCUS STONE's dark-eyed little girl grieving, with a *First Sorrow*, over her empty bird-cage, though a little over-smooth and artificial in tone, is refreshingly pretty and pathetic. Mrs. KATE PERUGINI and Mrs. ALICE MORGAN have done well in rather large pictures; Mrs. MORGAN's especially is somewhat ambitious in elaboration of brilliantly-coloured stuffs. Mr. ALMA TADEMA shows character and the dry solid execution of the Dutch school in a little interior with children.

We regret to learn that illness has prevented Mr. TADEMA from finishing to his satisfaction the children who, as *Mars and Venus*, were to have been his contribution to the exhibition. The remaining pictures have been shown elsewhere too recently to need comment.

Some correspondence has been called forth in the pages of a weekly contemporary by the comments passed on the shortcomings of the works in the exhibition of the painter-etchers, held this year at the Windsor Gallery in Savile Row. The president, Mr. SEYMOUR HADEN, has endeavoured to convince the public that the absence or slight appearance of more than half of the most distinguished members of the Society, including nearly all the Americans, is a fact that has only served to show what a genuine enterprise and artistic success the exhibition is. It is a dangerous thing to contradict Mr. HADEN, so we will not venture to do so; at the same time, he may allow us to deplore that his not very remarkable, if vigorous, sketch-plate of *Cowdray Castle*, and another equally unremarkable version of the same, with a change of living objects from cows to geese, is all that represents him, and that nearly all the French members, including in the list our Slade Professor, M. LEGROS, and M. TISSOT, and the English etchers, Messrs. HESELTINE, HODGSON, HOLL, HOOK, HAIG, HAMERTON, HEYWOOD HARDY (H is a distinguished letter in the etching dictionary), HELMICK, and Mr. HERKOMER, are absentees, together with others "too numerous to mention." However, some good achievement and some interesting tentative effort rewards the visitor to the gallery, and maintains the status of the Society. As examples we cite Mr. COLIN HUNTER's vigorous, broadly-etched sea-piece, *Lobster Fishers*; the grave, solid, a little heavy, work of Mr. WALTER BURGESS, in a view of Romanesque *Limburg Cathedral*, seen from the meadows below; the admirable woodland studies of the two Messrs. SLOCOMBE, the hasty little bits by WILFRID BALL, clever plates by C. HOLLOWAY and C. W. PLATT, reminiscences of Old London by NED SWAIN, the effective mezzotint landscapes of JOSEPH KNIGHT, and a study of a lioness *On Guard* while the lion sleeps by T. G. COOPER. In figures the work of Mr. STRONG, imitative of early schools in a simple broad mode of work, firm and deep in outline that ignores detail or texture, and generalises with a view to trenchant character and impressive sentiment, is very notable. In the vignettes likewise of rustic figures, complete drawing of excessive delicacy and a line that is seductive in playful ease could hardly go further. Mr. JACOMB HOOD sends only one clever sketch, Mr. R. MACBETH two, and the heads by G. RHEAD and by Mrs. MERRITT are worthy to be looked at; so are perhaps two tricky but clever subject plates by young students — *A Stormy Way* and *Shepherds*, respectively by Miss E. FORD and Miss E. HALLÉ. It is not one of the best signs for the school of original English etching that the use of all kinds of "dodges" in the treatment of background, and the mixture of methods without discrimination, should prevail among beginners in the art, and this sign is unhappily apparent in the exhibition before us. It is one thing for Mr. HADEN or Mr. HERKOMER, or any other proficient, to play with methods;

quite another for students who have not even mastered the sure draughtsmanship which should be the basis of all good line-work.

THE BUILDING EXHIBITION AT THE AGRICULTURAL HALL.

(Continued from page 207.)

CONTRARY to the usual custom with exhibitions on such a gigantic scale as the building exhibition at the Agricultural Hall, on Monday the last touches were given to the various exhibits, and it could be discreetly said "the house was in order"; and, considering the extent of the exhibition, the management may be congratulated upon the success of their labours. Mr. SHRAPNELL, the energetic secretary to the exhibition committee, has been indefatigable in his exertions, and we trust he will meet with a fitting reward for his labours. There are about fifty exhibitors in excess of the numbers of last year, which have helped to swell the numbers in the galleries, of which nearly three sides are now occupied with exhibits of the most artistic and interesting description. A large number of architectural drawings and proofs of art plates are to be seen exhibited on screens; and the walls are well covered with samples of decorative work. Looking down from the galleries upon the serried mass of exhibits on the ground floor, we believe there is a decided increase in the number of those firms exhibiting purely building materials, and although we notice one or two absentees of the artistic class, the exhibition does not appear to have suffered on this head, as their place has been filled by others, who exhibit goods, if different in their ensemble, are not the less interesting to the architect or builder. Artificial stone appears more conspicuously than on any previous occasion, and some of the makers of terra-cotta ware appear determined that it shall take a more prominent position in the future. Wood-working machinery figures more largely than it has heretofore done; and, as if to "point a moral" to the British carpenter, the display of foreign joinery clearly indicates the extent to which his labours may be dispensed with. The arcade is well filled with features in consonance with the exhibition, the absence of the "bazaar" element being noteworthy. We may add that a small room has been provided for the convenience of members of the press, an accommodation the absence of which has hitherto been much felt, and which will no doubt be fully appreciated by those for whom it has been erected.

MESSRS. JAMES STIFF & SONS, of the London Potteries, Lambeth, make an extensive display of architectural terra-cotta, combined with sanitary stone ware, through it is clearly evident that they rely in the main at this exhibition on the former production as their *pièce de résistance*, and we may honestly compliment them on their collection. Crowning the structure on which the bulk of their goods are, so to speak, built up for inspection, and forming the most conspicuous feature of the whole, is a life-sized figure in terra-cotta, standing with its plinth 6 feet high, of an "indigo planter," which is to form one of a group intended for the adornment of a "public building abroad," and there is also a specimen of a large enriched cornice standing 3 feet high on the face, which has been supplied (we presume) for the same building as the figure is destined for. Probably our friends have alighted upon some "happy hunting-grounds" unknown at present to their competitors, in which case we may account for their reticence. The figure is well portrayed, the folds in the habiliments natural and effective, showing not only the capabilities of the material for this work, but the skill of the artist also. The cornice, which is very handsome in design, the detail standing out sharp and clear, also appears very hard. Another commanding feature is a lion 5 feet 2 inches long and 22 inches wide, and like the other articles named, a meritorious production, the object sought to be attained being that works of large size may be "fired" very hard, yet be drawn from the kiln perfectly straight and true. There is also a red terra-cotta panel 4 feet 6 inches long and 2 feet 6 inches high, enriched with griffin vase and foliage, designed by Mr. A. CROFTS, as used in the new buildings erected in St. Mary Axe under the professional supervision of Mr. P. DASHWOOD. The colour, although called red, approaches somewhat of a purple, which is said to be the natural colour of the clay, and the tint we are informed can only be brought out by intensely hard firing, that many red clays will not sustain without injury; and it is

claimed that the heavy firing to which it has been subjected makes it practically imperishable. The work is decidedly effective, and we imagine the colour will become a favourite one. The other architectural features comprise a number of caps and capitals, window heads, medallions, panels, balconies, terminals, &c. There is, in addition, a bold keystone with fruits and flowers, and a collection of ornamental arch-filling from 4 to 20 inches on face; nor must we omit to mention some attractive specimens of garden vases. Chimney-cowls in terra-cotta also figure amongst the collection, the "scientific" being perhaps the most notable, and the usual accessories connected with this industry, such as ventilating bricks in different colours and sizes, and Crown stoneware help to swell the exhibits. In addition to the above noted, is their patent ventilating damp-proof course. The firm also exhibit a collection of embossed wall-tiles for dados, &c., in various colours and effective patterns; and amongst their sanitary stoneware we would call attention to the WEAVER and Interceptor sewer air-traps, and the WEATHERBY sink and waste water-trap. Their "Adamant" terra-cotta steps, suitable for the roughest wear on account of their hard firing, are also worthy the attention of the profession.

Messrs. DOULTON & Co., of Lambeth, are, to use a hackneyed expression, almost conspicuous by their absence. We understand it was not the intention of the firm to have been present on this occasion at all, but to have reserved their efforts for the furniture exhibition to be held here next month, when we believe it is their intention to remove their late display at the rooms of the Society of Architects, in Conduit Street, *en masse* to the Agricultural Hall. They have, however, furnished one of the bays in the gallery with three of their elaborately furnished open fire-clay grate suites, and one or two close stoves, supplemented by a few specimens of majestic hand-painted vases, and selections of their "DOULTON" ware as enrichments, but the *monstre* display we have been accustomed to look for from this eminent firm is this year denied us.

The Hartshill Brick & Tile Company are as usual well represented, and exhibit amongst their well-known productions several new and well-designed finials, panels, and string courses. A new sheet, forming page 14 of their illustrated designs, has recently been issued by the Company, and may be obtained at their stand. It is almost unnecessary for us to indulge in any lengthened eulogiums on the goods manufactured by this firm, which compare most favourably with any brought into the market; we may, however, remind our readers that the Hartshill tiles are non-porous and considered to be capable of standing any kind of weather, and that their "finials" are adapted to any angle of roof, keeping it perfectly water-tight without the aid of lead or any other material. Any colour in which these appliances are usually manufactured can be supplied, the "shade" being regulated by the firing. Paving tiles are also exhibited, on the quality of which the firm lay great stress, and claim that they will compare favourably with encaustic for quality, and especially for endurance. Garden tiles, stable, paving, and other blue vitrified bricks are shown on this stand; and we doubt if the variety of patterns of their various productions, or the quality of their goods, are surpassed by any house in the trade.

The demand for non-poisonous wall-papers is fortunately on the increase, and the visitor to the building exhibition will be enabled to view a commendable assortment shown by Messrs. JEFFREY & Co., Essex Road, Islington. The speciality of this firm, if we may select one where several are claimed, is that of being enabled to produce machine-printed papers either with or without gold embellishments, and in designs that may be classed as "artistic," at prices that compete with those of the most commonplace character; and we may mention in particular a staircase decoration of terra-cotta character in light-red and buff, with a Pompeian red dado and border, that may be obtained at a cost cheaper than any ordinary marble papers, and that may be varnished in the same manner if desired. Turning to the higher class of papers manufactured by this firm, we find dado decorations, friezes, &c., at correspondingly low prices; and there are designs executed by Mr. J. D. SEDDING and other artists of known repute. The firm also show a few specimens of embossed leather papers, hand-painted, of rich character; and we may fairly recommend a careful examination of the patterns shown by Messrs. JEFFREY & Co. by those interested in paper decoration.

The Bracknell Pottery, Brick and Tile Company, Bracknell, Berks, show a varied selection of the articles after which their

firm is named, comprising several new patterns in moulded, facing, and other hand and machine-made bricks, rubbers, chimney-pots, garden edging tiles, ornamental glazed tiles, and last, but by no means least, every description of roofing tiles, ridges, and finials. These latter are a specialty of this firm, and the exhibit, as regards quality, holds its own with anything in the hall, while less cannot be said of the erection they have put up to display them. It consists of a few courses of brick-work, above which is a specimen of weather-tiling, and covered with an ordinary roof with a gable end; and as the height at the eaves is under 5 feet, one has a fair chance of thoroughly examining them. The hips, valleys, and angles, especially the latter, are exceptionally clean and true, and we understand the firm always have in hand a considerable stock of these at various inclinations. Though all the tiles, including the weathering, are merely tacked to battens, they have every appearance of being set in cement, thus demonstrating what we have already said of them. The ridges and finials are of excellent design, and both for shape and finish leave nothing to be desired; in fact, many of them look more like samples of woodwork than what they really are.

MESSRS. ARCHIBALD SMITH & STEVENS, 48 Leicester Square, show samples of their various lifts, including a working model of STEVENS and MAJOR'S patent hydraulic balance-lift and full-size "complete" self-sustaining single and double dinner-lifts. The former is now pretty well known, being in use in many of our large public buildings, and among the advantages it possesses are safety, rapidity, and the ease with which it is controlled. The "complete" lifts possess many advantages, and are quite self-sustaining, no matter how great the difference may be in the weight of the loads (in the double one), or how much heavier the load may be than the balance weight (in the single one). The endless hand-rope is all that is required to work them, and immediately this is let go the break comes into play automatically by means of an ingenious action fitted to the shaft overhead. A patent self-sustaining sack hoist with hook, and a patent self-sustaining bracket hoist, constructed on similar automatic principles, are also shown.

The stand of Messrs. GEORGE FARMILOE & SONS, 34 St. John Street, West Smithfield, the old and well-known glass, oil, colour, and plumbers' merchants, possesses several attractive features. They have of late become manufacturers of many articles, no doubt feeling the truth of the adage that what you want done well you must do yourself; and, judging from the specimens of valve closets exhibited by them (that being the most particular form their ideas have assumed), their efforts have been very satisfactory. They are well made and offered at a price, we believe, lower than any other at present in the market. Ornamental leaded-glass panels, too, is a *spécialité*, and samples are shown from the very simplest to the most *recherché*. Another salient feature in their display is the collection of American drawn-lead traps and bends, and American gun-metal valves. The former are made by hydraulic machinery in the same manner as lead pipe, and having no seam, and being of uniform thickness, are much superior to cast-lead traps, and as evidence of the favour in which they were held, the supply, when first introduced, was not equal to the demand that at once accrued for them. Messrs. FARMILOE are, however, now prepared to supply any quantity. The valves are highly finished, and fitted with seatings made of a patent fibre that is warranted to stand either hot or cold water. Amongst their pumps the "GIBSON" Patent Cistern Pump is new this season, and is an admirable invention. It consists of a brass pump enclosed in an iron casing, the lower part forming a vacuum chamber, and when made as a lift and force pump the upper part forms an air chamber. It is so constructed that it is claimed it will work easier with a 1-inch suction pipe than ordinary pumps with 1½-inch, and that it is the simplest, most complete, and cheapest first-class brass pump yet introduced.

In noticing the various inventions that the requirements of the times have called into requisition, a large number of hands are now constantly employed in the manufacture of "lifts." From the most simple appliance for conveying goods from one floor to another they have developed into scientific apparatus worked by gas, steam, or hydraulic power, as well as by hand labour. We need scarcely call attention to the varied uses to which they are now applied, the handsomely-furnished little rooms for carrying the inmates of an hotel to their various landings being amongst the most notable. In this industry Messrs. R. WAYGOOD & Co., Falmouth Road, S.E., have always played a conspicuous part. At this exhibition they

show several worked by manual labour for various uses, the facilities of the hall precluding the introduction of the power machines. One of these—a patent hand-power lift of their Class B character—is made self-sustaining or otherwise, suitable for warehouse purposes, and made to carry any amount of weight, according to the requirements of the firm using them. The self-sustaining gear is of course recommended, and the makers give the preference to ropes over chains—first, because they are noiseless; and secondly, that the wearing away of a few strands are at once detected, whereas a breakage of a link from any untoward circumstance may not so easily become known, and an accident may be more likely to occur. There are also a single and double self-sustaining dinner-lift, adapted for either public or private buildings. These are excellent specimens of workmanship, and the makers claim for them several advantages over other apparatus professing to effect the same purposes. A neat little hand dinner-lift for a private residence forms another example in the collection. This is worked from the kitchen, and is so arranged that no overhead gearing is necessary, and is one of the simplest and most inexpensive kind manufactured. Messrs. WYGOOD's illustrated pattern-book shows drawings of every description of lift or hoist manufactured by them, including a sumptuously upholstered one for a large hotel, the arrangements in one or two instances being of a unique character. Everything shown bears the impress of sound workmanship and careful manipulation in the various details of the appliances.

The Thames Bank Iron Company, Upper Ground Street, Blackfriars, make an imposing display of warming and heating apparatus as well as of ornamental ironwork, such as lamp-posts, brackets, &c., and pipes and tubing for different uses. The specimens of boilers shown, both wrought and cast, are numerous, and comprise such as are suitable for any sized building, and for horticultural use. One of the most noteworthy features in this exhibit is the improved base-burner gill stove manufactured by the firm, one of the earliest of this class of heating appliances introduced, and which has formed the basis for some imitations. A peculiar feature in this stove is that it is built up in segments, that is to say a series of rings several inches in depth, having deep gills cast upon them, are fitted one upon the other, each fitting into an air-tight joint having no bolts, and being free to expand or contract without injury to the stove. The top portion is made of conical form, and contains the flue pipe and feeding aperture, and from the arrangement before-mentioned it will be seen that the top section can be placed to allow the flue-pipe to stand out in any position required. Another great advantage is that the gills are cast in a vertical position, causing them to give off the heat more rapidly, and to intercept and more readily diffuse the current of heated air rising through them. They are made to be fed from the top as well as the front, and when once filled require no further attention beyond an occasional removal of ashes, and have no fire-bars or dead-plate, the fire burning on a plain base, the draught being regulated by a sliding door in front, and by a damper in the smoke-flue. The heating power of this stove is probably greater than that of any other of the same dimensions in the market, the one of 12 inches diameter and 3 feet 6 inches high, containing 50 superficial feet of heating surface. Its third commendable feature is that when properly set there is little fear of burning the air should the stove be neglected, as the greater the heat of the surface of the gills, the more rapidly is the air impelled through it, and the area of the gills exceeding that of the stove in the proportion of 9 to 1, it must be clearly seen that the temperature of the burning fuel is rapidly reduced and given off into the building. The firm also exhibit several ornamental skirtings for covering hot-water pipes, amongst them a facsimile of that fitted up by them at the rooms of the United Arts Gallery in Bond Street.

Mr. R. ADAMS, of Great Dover Street, Borough, who generally manages to introduce some novelty at this exhibition, is not found wanting on this occasion. The new feature is a very simple arrangement of a compensating character, to enable any householder where the contrivance is fixed to take up or obviate any warping or expansion of a door, and it is applicable to any class, not even excluding railway or other carriage doors. It consists in affixing a slip of wood the entire length of the door between it and the framework to which it is fixed by set-screws, and the door in its turn is hung to the slip. The set-screws are three or four in number, placed equidistant along its surface, and in the event of the door binding at any particular point a turn or two of the set-screw will generally

obviate the nuisance, and set it in working order. Another invention of Mr. ADAMS that we think has not been yet mentioned in these columns is a "panic" door for a theatre or other place of public entertainment. These doors may be of iron or wood, and several may be arranged around the building or at the most convenient points of egress. At the side, and covered by a small glass disc similar to that of the fire-alarm posts erected in the streets of London, is a handle, and, on breaking the glass and giving a turn to the handle, the door, which is counterpoised by balance-weights heavier than itself, rapidly ascends into the recess prepared for it, and offers free egress to the occupants. This idea is certainly worthy of attention. It is quite within the range of probability that a large number of buildings at present in existence may be rendered comparatively safe in the case of panic by the adoption of such means, which may be added at an expense that would be but trifling when compared with the amount of safety they would provide. The remains of Mr. ADAMS' exhibit is made up of the several appliances with which his name has become associated, all of which have been mentioned in the columns of *The Architect*. The most notable of these is his patent secure "fanlight-opener"; the "anti-accident window," which provides a ready and simple means of inverting the sashes for cleaning from the inside; the "spring-sash bolt," to secure the windows when open a few inches for ventilation; his patent sash-fasteners; "converging and regulating spring-hinge and adjustable shoe"; not forgetting the effective little cord-holder for Venetian blinds, the "Toby."

Messrs. SHANKS & Co., Sanitary Engineers, Barrhead, near Glasgow, are occupying the same position as last year with, it is needless to say, an equally admirable assortment as they exhibited upon that occasion, and with the addition of one or two important improvements. The handsome bath combining plunge, spray, shower, and douche, with fittings for hot and cold water and waste arrangement, which all visitors will doubtless remember, has undergone a complete transformation. It is termed the "Eureka" bath, and in its present form may be called the acme of luxurious bathing. The canopy and that end of the bath is made more circular than before; so that the spray jets all converge to the centre, and also gives the bather more room. A no less important feature in this bath is the arrangement of the fittings; hitherto it has been found necessary to have as many as sixteen pipes for the hot and cold supply and waste, but by Messrs. SHANKS' patent only six pipes are required, thus saving a considerable amount of labour in fitting and fixing, and consequently reducing the expense, thereby putting it within the reach of a greater number. Their new Patent Citizen Bath is another specimen of combination, in which the waste and overflow are cast on; but by arranging them differently the cost is modified, and a bath produced at about the same price as an ordinary one with loose fittings. Another speciality worthy of note is the branch-valve closet, with a new patent waste-preventer under seat, and by means of regulators of larger size than usual is rendered very efficient and is easily kept in order. Lavatories, including some of very elegant design, BUTLER's sinks, fittings, and other sanitary appliances, make up this firm's exhibit.

Another firm of sanitary engineers have taken up their stand at Bay 1. We refer to Messrs. R. F. DALE & Co., Bear Lane, Southwark. Their exhibit comprises DALE's patent "European" side-outlet and other closets; baths and bath fittings; lavatories of various kinds, from the cheapest to some very elegantly-fitted ones; pumps for house, factory, and other purposes; and a first-rate assortment of plumbers' and other brass-fittings. On looking over the goods here brought together, one cannot fail to notice the solid and substantial appearance of each and all of them—a fact not to be lightly passed over nowadays, when the tendency is to turn out things of a lighter and more showy character. Amongst the closets their new patent "European" side-outlet valve closet possesses many important features, particularly the combination in one apparatus (as its name implies) of the advantages of the "flush-out" and "valve" closets, at the same time avoiding the individual defects of each, the result being a thoroughly sound closet with double seal. Another point is that the overflow is so arranged and of such dimensions that for it to become blocked is practically an impossibility, and as the outlet is central with the basin it can be fitted in the place of an old-fashioned closet with very little trouble.

Mr. C. D. PHILLIPS, Emlyn Works, Newport, Mon., again occupies Stand 53 with his patent "Lock-jaw" tiles, that

caused so much attention last year, and which are now coming into very general use, being highly appreciated as soon as their advantages become known. The name is a very appropriate one, and has been given on account of the manner in which the tiles lock into each other at each side and top and bottom, making a perfect roof, at once wind-proof, snow-proof, and rain-proof. So great has been the demand for these tiles that at one time the patentee simply had to refuse many large orders for them; he has, however, established works at Bridgewater, Burnham, Cardiff, Ipswich, and other places, and is now able to turn out any quantity. Mr. PHILLIPS has introduced another pattern which he terms the "Double Grip Lock-jaw" tile, the difference being that it has a double joint, and is more ornamental in appearance. Several very good designs of finials, crests, and other terra-cotta work are also shown at this stand, manufactured for the exhibition by the Pencoed Brick and Tile Co.

The Sneyd Colliery and Brickworks Co., Limited, Burslem, have of late been turning their attention to white and other glazed bricks, and, judging from the samples on show, what they are turning out are not second to anything that is in the market. In saying this we refer principally to their durability and quality, for the firm admit there are bricks of a more perfect whiteness being made at several manufactories. It is claimed that the glazing will, under no circumstances, chip or peel, and will not come off without bringing a piece of the brick away with it—a thing impossible to take place with fair usage, the clay of which they are made being exceptionally dense and tenacious; and, as we had an opportunity of witnessing an erection of these bricks at the stand, can so far testify to this, and this special feature is attained by putting the glazing on the brick in its green state, and so insuring a thorough amalgamation; and the firm have doubtless acted wisely in preferring to sacrifice the production of a perfect whiteness of surface to the total immunity from risk of peeling or cracking. The Sneyd Company are also manufacturers of general fireclay good, drain-pipes, &c., and are represented in town by Mr. E. HOLWILL, Walbrook House, E.C.

MESSRS. ARCHIBALD KENRICK & SONS, West Bromwich, the eminent firm of hollow-ware manufacturers and builder's ironmongery in cast-iron, contribute a rather unique exhibit. Inside a solid square erection of considerable dimensions, approached by two entrances facing each other, are arranged a considerable assortment of the numerous small wares made by the firm for the carpenter's and builder's use. Great taste and tact has been evinced in the ornamentation of the stand, both in and outside, and has shown what good effects can be obtained from the most commonplace materials when in the hands of an intelligent manipulator, the ornamentation in question being made the medium of showing a variety of the firm's productions. Around the interior, on cloth-covered panels, are artistically set-out patterns of the numerous hinges made in cast-iron, many of these being of ornamental character, and in various styles of finish and colour, including nickel-plating, *verd antique*, and other colour bronzes, Berlin black, &c. The collection of door-handles, from the common "hotbed" to the highly ornamental and massive outer-door handle, are so numerous, both in size and pattern, that it is impossible to say more about them than that the designs are quite equal to the best in the market made of the richer metals, while the price is but a fraction of what the latter would cost. The common drop and stable latches are shown in designs that a few years since were not procurable; in fact, the Messrs. KENRICK have thrown an amount of *verve* into these little *bric-à-bracs* of the building trade that is worthy the highest commendation. A panel of patterns of letter-box plates are also on view, and the foregoing remarks may equally apply to them. Nor must we overlook a new collection of door-knockers, shown for the first time, balanced most perfectly for the "fall," excellent in design, and very narrow, fitting them for the most narrow-framed door. A few patterns of fire-dogs help to vary the display of ornamental work; and there are articles of domestic use to which for the first time, that we remember, an artistic character has been given to the designs. The many examples of pullies, amongst which are several of their patent action (some being shown that have been worked twenty thousand times), are worth notice; and an assortment of HATFIELD'S patent rollers, of which the firm are the manufacturers, complete this portion of the exhibits. There is also a commendable collection of cast-iron enamelled sanitary ware; and a striking feature in

the exhibit, as they form two of the largest articles shown, is a nickel-plated and a bronzed flower-stand, each having fifteen plates, and decidedly American in character as regards design and casting, the firm having essayed the style of our Transatlantic friends in many of their productions with much success.

MESSRS. ASHTON & GREEN, Bury Street, St. Mary Axe, and other addresses, occupy their usual position in the hall, and have a somewhat similar display to what they annually bring together for inspection. Mantel-pieces in marble and enamelled slate, of which the firm are extensive manufacturers, stove grates, and their accessories form by far the largest portion of the exhibit. There are six superb suites of *entourage de cheminée*, two of the mantel-pieces being of the finest statuary marble, and containing some rich and delicate carving. A black and griotte marble forms a splendid dining-room appanage, and all have either dog-grates with rich hand-painted tile slabs, or register-grates with similarly decorated tile cheeks. Most of the tile hearths are now made in only three pieces, a "picture," so to speak, forming an attractive feature in the centre; and, where a dog-grate is used, the side slabs should be in keeping with the design of the hearth. The grates exhibited are so numerous and so varied in style and quality, that the buyer must indeed be fastidious who cannot make a selection from Messrs. ASHTON & GREEN'S stock. Our attention was drawn to an enamelled slate mantel-piece, with hand-painted flowers on a gold ground, which the firm consider a *chef-d'œuvre*; but we consider a design more in consonance with the present style of decoration would have been preferable to the pattern selected by the artist. Turning to kitchen ranges, we find the assortment as varied (considering the more prescribed limits) as in the grates, and could not but admire a fine specimen of a combined gas and coal range, about 7 feet long, with all the modern improvements. In this range the gas is kept thoroughly distinct from the coal section, has its own oven or roaster, and hot-plate or boiling arrangements, and the mountings are all nickel-plated. Messrs. ASHTON & GREEN, who, it will be remembered, are extensive slate-quarry owners, exhibit a complete set of samples of slates, including the "permanent green" as supplied by them for the New Law Courts; and they have brought together a most complete set of samples of building appliances made of clay, from the "quarry" to the crest-tile and finial, in many patterns and qualities. We may remark, in conclusion, that the ramifications of the firm are of the most extensive character, and include the supply of every appliance and material for both indoor and outdoor use required by the builder.

MR. THADDEUS HYATT, of Farringdon Road, is present with his patent lens and prism lights of various patterns and descriptions, suitable for pavements, roofs, &c. One very satisfactory arrangement in which the lens lights are shown is in connection with silvered glass reflectors, which, fixed beneath the range of lights, can be raised or lowered to any required angle to throw the light in a basement to any required spot. Another example shows them fitted in connection with an encaustic-tile pavement, and a completely flat surface called a "safe-walking surface." In this arrangement the iron framework is completely hidden from sight, and forms an agreeable walking surface. An extra strong and new roadway light is in addition exhibited, which is capable of admitting horse-and-cart traffic passing over it with safety. Mr. HYATT also exhibits several illuminated coal-plates, besides vertical and other lights, the arrangement in each case being of a perfectly satisfactory character.

Stand D 134 is quite an attraction, and justly so, to all who are in any way interested with wall decorations. In the centre of the exhibit, which is that of Messrs. WOOLLAMS & CO., manufacturing paper stainers, of 110 High Street, Manchester Square, W., is a tapestry pattern, their No. 14,996 in Venetian style, and of very handsome design, consisting of a bold zigzag strap ornament, with overlying pattern of rich flowers and foliage, and an underprint of gold. The design itself is 21 inches by 42 inches, but the colour being varied no actual repeat occurs in 42 by 42 inches, thus giving unusual variety, and though no written statement could convey to one anything like an idea of a thing of this magnificence, we may mention that it contains thirty-eight different tints, which, multiplied by variation in position in the various sections, are equal to ninety-four ordinary printings. To the right of this is a Jacobean decoration, "Lyre Bird," designed by Mr. OWEN DAVIS, in a new colouring; to the left a dado decoration in ADAM'S style,

in shades of terra-cotta, red and gold, the work of Mr. A. F. BROPHY. Amongst the other specimens is a fine chintz "magnolia" and an Italian tapestry pattern in soft velvety tints, both on milk grounds, with imitations of Genoese and Venetian tapestries in "Cheviot" flock. The patterns of raised flocks finished without paint on plain, coloured, and mica grounds, as well as some of the patent embossed ones with and without gold, are very richly modelled. Dados in real embossed leather and embossed leather paper are also shown, as well as a variety of smaller patterns too numerous to describe.

Messrs. CLARK, BUNNETT & Co., Rathbone Place, W., occupy Stand E 168, and show a variety of their well-known manufactures. Each side of the stand faces an avenue, and is fitted with pilasters and facias, as used for shop fronts, &c., respectively complete with their patent, revolving, noiseless steel and wood shutters, and in addition specimens of revolving shutters recently fitted by them to forty openings in the new landing stage of the Transatlantic Steamship Company at New York. Lifts, for the manufacture of every description of which it is needless to remark this firm are especially noted, are represented in the shape of an average-sized warehouse lift in working order, showing the patent safety-gear that they fit to every apparatus, and which grips the cage to the chase should an accident occur to the centre rope. A windlass, with patent gearing, recently introduced, is well worthy of attention, its salient feature being that it occupies less than half the width of the ordinary ones, and so is of exceptional advantage for use in city warehouses, and in fact in any place where every inch of ground is an object. A working model of a patent hydraulic railway truck hoist gives an idea, albeit but an idea, of the heavy engineering department of Messrs. CLARK, BUNNETT & Co., while an assortment of sections of metallic shop-fronts, fancy castings, metallic Venetian blinds, and numerous other sundries completes this collection.

The hygeian rock building composition, that was the object of keen astonishment to all visitors to last year's exhibition, under the supervision of the patentee, Mr. W. WHITE, Abergavenny, and 3 Westminster Chambers, Victoria Street, is here again in the same position, and, judging from the number who constantly congregate around the stand, the interest in it is unabated. This is not to be wondered at when we mention that, upon approaching the exhibit, a block of brickwork 9 inches thick, 4 courses deep, resting on supports with bearings of only $5\frac{1}{2}$ inches, and a span of 5 feet 6 inches, with a massive chain fastened round the centre, suspending a tray and a number of 56-lb. weights amounting to upwards of half a ton, is the sight that presents itself. Upon closer examination, however, it will be seen that a flitch about half an inch thick of the composition binds the two ($4\frac{1}{2}$ inches) walls together, they being built up separately with mortar; and it is in this flitch of composition alone that the secret of the strength lays. At a test made in the hall on the 4th inst. with this same block—which, by the way, has been built but a short time—in our presence, 56-lb. weights were placed on the tray until the total weight reached 1 ton 9 cwt. 3 qrs. 3 lbs., which failed to make even any deflection, much less to break the mass; and at a test made some time ago in Birmingham, bricks of the best quality were completely crushed, but the flitch of the hygeian rock composition was not fractured. It will be readily understood, then, that walls built with this material must be considerably stronger than without it, and will, we believe, take something like double the strain of an ordinary wall; and plans are shown of buildings—notably a chapel of a considerable roof span, of which the architect was Mr. A. W. BLOMFIELD—where 9-inch walls built with this composition have been used that in ordinary work it would have been necessary to use 18-inch walls. The hygienic rock composition is also an excellent material both for horizontal damp-proof courses and for vertical impervious lining, especially the latter, for which it is admirably adapted.

At Stands B 59 and C 88 Messrs. ESDAILE & Co., of Wenlock Basin, City Road, have brought together a good assortment of machine-made English and foreign joinery, comprising various descriptions of outside, front, and back doors, inside doors, balusters, trellis-work, &c., all of which appear to be made of well-seasoned stuff and equal in finish to the work usually turned out by this firm, which is now of such reputation that any more remarks we could make to demonstrate this fact would be quite superfluous. Besides the above, a large assortment is shown of ships' blocks and fittings, and a

variety of other pulley-blocks for building and other purposes, which leave nothing to be desired.

Another system of glazing without putty is that patented by the Pennycook Glazing and Engineering Co., Limited, of Glasgow, and 57 Chancery Lane, W.C., which combines the advantages of separate lead and zinc systems without their individual defects. It consists of a series of sash-bars, constructed of sheet zinc, copper, or other metal, in such a form as to give the maximum of strength with the minimum of metal, and at the same time to form a double gutter in each sash-bar for carrying off moisture condensed on the inner surface of the glass. The glass is kept in its place by the simple folding down of narrow flanges of sheet lead, which are rolled in with the zinc or other metal of the bars, while broken panes can be replaced with as little trouble. It has been adopted by many public and Government bodies, for roofing railway stations, docks, &c., and, we should think, has an excellent future before it.

Messrs. HOWARD & SONS, of Berners Street, Oxford Street, whose name has become so associated with the manufacture of parquet flooring, have made an excellent display of their speciality, their stand having a double frontage, the ground of each space being covered with many specimens of different pattern parquet, all of which evince good taste; while the bay or recess is furnished with a few examples of wood mantel-pieces and articles of furniture. There is an unique mantel and overmantel painted in pure white, the fire-place holding a quaint wrought-iron dog-grate that is certainly a "feature" in the entire exhibition, the sides of the fire-place containing a pair of handsome tile slabs. A door and overdoor, designed as a companion to the mantel-piece, is also shown, and the overdoor is arranged to hold small pieces of pottery ware. On the opposite bay is a handsome mantel and overmantel in rosewood, having a "classic" touch about it, though the artist has not trammelled his fancy by following any decided style; it is, however, a very meritorious work, and in some points different to any other in the hall. In this is set a last-century bright open grate, a "frame" of Sienna marble encasing this. The fender and irons are quite in keeping with the grate. A few good wood dados are also exhibited, and the specimens of furniture in this bay, though "severe" in style, evince considerable taste in their outlines. A collection of LOUIS SEIZE chairs, upholstered in cretonne, are very commendable; and another "pronounced" feature here is an old mahogany door, in a frame, and overdoor coloured in one of the neutral tints—a dull pink. Messrs. HOWARD also occupy two bays in the gallery, these being devoted exclusively to drawing-room furniture. Here the chairs are also upholstered in cretonne; but the most interesting items in these bays are in our opinion a three and four-panel fire-screen. The smaller of the two is, beyond the wood frame, filled in with silk panels, with floral hand-paintings artistically executed; and the larger contains small panels of silk at the top, also hand-painted, the pencilling in this case being of course very small, on account of the reduced size of the squares; but both are veritable art-works, and deserve much praise.

It is sometimes almost impossible to select distinctive features, in speaking of parqueterie, to call the attention of the reader to, each manufacturer's production, if placed side by side, oftentimes showing but little difference; but we must not pass by the work of Mr. HENRY BASSANT, of the West London Parquet-flooring Manufactory, Wells Mews, Wells Street, Oxford Street, who appears well able to hold his own against his many competitors. He has a large selection of patterns on view suitable for dados as well as floorings, many of his designs being decidedly original, and great care has evidently been taken in the selection of the woods, the grain of most of them being well marked and rich. This is very much the case with those patterns that are partly made up of polished oak, and it is but justice to say that Mr. BASSANT's designs will compare favourably with anything of the kind in the exhibition.

What can we say more than we have on previous occasions of the Albissima Paint Company, 34 Lime Street, E.C., whose small, artistically-built stand has lost none of its attractions, though somewhat dwarfed here by the larger erections around it? But few of our readers require to be told that "Albissima," as its name implies, is one of the few pure or non-poisonous paints of reliable worth of which we can boast; and the Company have recently, at the wish of many of their customers, introduced it in various colours, in small tins, for domestic use, which will bestow a great boon, for the advantage of being

enabled to obtain a paint for any little purposes paterfamilias may think proper to undertake in his own household, that he can use without evolving the sickening and injurious odours arising from white-lead paints, cannot be over-estimated. Until a comparative recent date it was argued, as an objection to this class of paint, that the bright and rich colours could not be obtained; but this has been proved to be quite erroneous, and even emerald greens can be supplied perfectly innocuous in their composition. The neutral tints and low-toned colours now so popular suit the "Albissima" admirably; but it is to its great virtues as a non-poisonous pigment, its body, and consequently great covering power, its free working under the brush, its qualities for resisting the powers of the sun, that has made it such a favourite at watering-places, and its attributes for withstanding the sulphurous compounds of the atmosphere in manufacturing towns, on which the Company rely for their success. Some of the most notable royal and public buildings bear testimony to its worth, while numerous hospitals and kindred institutions constantly patronise it; and it is not too much to say of it that a family may remain in their home while it is being repainted without suffering in health from it.

A well-known firm, from the East Riding of Yorkshire, Messrs. VERITY BROTHERS, of Leeds, contribute specimens of their patent window and frame, designed for swinging the sashes for the convenience of cleaning from the inside, and an easy arrangement for opening for ventilation, combining security at the same time, and is of a most simple construction. By the mode in which the swinging sashes are arranged, it is impossible for them to fall bodily into the street, a misfortune that has before now befallen some of the "sûre" windows, and the construction of the sashes can be altered to meet the fancies of those requiring them, or according to the conditions of the place where they are to be fixed. The action of opening or closing the top sash when required to swing, is accomplished by means of a small chain, and may be worked by a child. It is almost needless to add that the action can be applied to any class of window, fan light, &c. Messrs. VERITY also exhibit several frames, showing patent window openers, casement stays, bolts, and weather bars, window security having evidently been well studied by them. They, in addition, have sent a small collection of good wood-working machinery.

Mr. GEORGE PORTER, 23 Cullum Street, E.C., exhibits an interesting collection of his patent pneumatic bells, by which he dispenses with the perishable indiarubber bags. The system of pneumatic signalling, when well laid down, is undoubtedly one of the most reliable, and it has this recommendation over the electric principle, that no recharging of batteries or any attention is required, and should last as long as the material employed, unless wantonly tampered with. By Mr. PORTER'S arrangement perfect reliability appears to be secured, and as regards the "pushes" for driving the air, they are made either to push in, to act as a quadrant, or as a pull out. Mr. PORTER in addition introduces us to a patent metallic diaphragm gas governor, that appears to answer its purpose admirably. Broadly speaking, it is based upon the principle of all other gas governors, viz., regulating the admission of the supply from the meter and to the burner, but it differs from most others in the fact that the diaphragm that works the valve or regulator is composed of a metal which it is claimed is utterly impervious to the action of gas, steam, or water, and so renders repairing or replenishing as regards the diaphragm unnecessary. The saving of gas, besides obviating the singing, the sudden raising of the lights, &c., when part in a house are turned off, are all recommendations to these economic appliances, which when once fixed require no further attention.

Since the exhibition has become fully developed, additions have been made to some few of those displays we noticed last week that deserve further remark. Thus Messrs. WELLS & Co.'s, Limited, exhibit has assumed more extensive proportions than we had anticipated, and contains some choice *morceaux*. The display of ironwork is decidedly good, and comprises articles covering a wide range, from a tomb railing to a weather-cock and crestings. A section of a noble verandah is a conspicuous object; there is a handsome spiral staircase, and numerous examples of gates, railings, &c., both in cast and wrought iron. The gas-fittings form quite an exhibit of themselves, and, being arranged in a single row, each one is clearly seen, a great improvement on their former mode of arranging them. Hall lanterns form a conspicuous feature in these, and there

are some tasteful brackets and gaseliers in plain-polished brass, in which a floral decoration has been introduced with excellent effect; others, again, favouring the æsthetic outline. There are some elegant china vase and dish gaseliers, and a pair of double brackets, gilt and electro-plated, that carry a *distingué* air with them. A massive eight-light gaselier, suitable for a large public room, is suspended from the ceiling of the hall. This is in steel bronze, relieved with a group of figures in the centre around the down rod in real colour bronze. It is a very striking feature, and a fine bold conception. A collection of electric bells and alarms, fitted to doors, windows, &c., forms another department in this extensive exhibit, and we can but compliment the firm on the spirited manner in which they have carried it out.

Messrs. HODKINSON & CLARKE are another of the firms we mentioned last week who have introduced some entirely new features. These consist of some charming festoon spring blinds, the body being composed of Madras muslin, the festoons towards the bottom being formed of different coloured cloths, and fringed with lace. They are attracting a great deal of attention, and have quite a *recherché* look with them. The Madras muslin, while retarding the rays of the sun from entering the room, does not obscure the light, and give to the apartment that dismal and funereal appearance inseparable from a solid cloth or Venetian blind, and the pretty patterns and colours of the Madras muslin are more interesting to the eye to rest upon than a self-coloured material.

The attendance up to the time we write has been fair, but by no means large; as a rule the great bulk of the visitors do not attend the building exhibition until the second week, and it is a matter for consideration whether a fortnight is sufficiently long for an exhibition of this character, particularly when we consider the great expense many firms incur in the sending of their exhibits and their erection in the hall.

PARIS NOTES.

THE competition for the Prix de Rome in painting has now opened. The following categories of students are exempt from the first stage: (1) those who have previously gained a second prize or mention in a Prix de Rome competition; (2) those who have already been admitted to *loges*; (3) those who have gained a first medal in one of the chief competitions of the Ecole des Beaux-Arts. This first stage consists in the execution of a painted sketch in oils on canvas 16 inches by 13 inches within a space of twelve hours, and the number of competitors is limited to twenty, without, of course, counting the exempted. In the second stage candidates have to execute (1) a sketch in oils, and (2) the painting of a figure from nature, the model for which is placed in position by a member of the Académie des Beaux-Arts. Finally, from this ordeal, only ten students can issue to take part in the great competition, for which they enter *loges* and have to paint a canvas 58 inches by 46 inches.

The members of the French Senate and the Department of Fine Arts continue to be at loggerheads over the Luxembourg Palace. The former have for some time past been attempting to take possession of the galleries on the first floor, devoted to paintings of contemporary artists, and offer in return the Palace Orangery, for which they have no use. The Administration des Beaux-Arts is doing its utmost to resist these encroachments, and affairs seem now to have come to a crisis. On the one hand the Questors of the Senate bring forward in support of their pretensions a decree of the Consuls of the First Republic, issued at the very beginning of the century, whereby the palace was set apart for the deliberations and service of the Upper Chamber; while on their side the Conservators of the Museum produce another decree, devoting the Luxembourg rooms and galleries to the reception of works of living artists. Neither side appears willing to give way, and the matter will have to be referred to the Conseil d'Etat for settlement.

Statistics have just been published showing the number of applications for authority to build received by the City authorities, and of private buildings commenced in the French capital, during the first eleven weeks of the last four years. These figures are interesting in view of the crisis now threatening the Paris building trade. As regards applications, in 1880 they numbered 270; in 1881, 467; in 1882, 580; and this year only 324. In

1882, 190 out of the 580 buildings for the erection of which permission was demanded, belonged to speculating syndicates, whereas this year applications of this sort have fallen to 324. From these figures it will be seen that the applications have decreased by about 45 per cent.; but when we come to look at those relating to buildings absolutely commenced during the same periods, the decline is found to be only 12 per cent.—from 366 to 323. It is evident, therefore, that the crisis, if such there is to be, has not yet reached an acute stage, the decrease in the actual building going on in Paris now as compared with April of last year being very small; and the outcry already set up by the workmen, or rather by their officious friends, would appear to partake somewhat of the nature of crying out before they are hurt. The falling off in the number of applications will, however, towards autumn, bring about a serious decline in actual building operations.

In order to guard against the danger of inequality or patchiness in the interior decoration of the new Hôtel de Ville, M. Vauthier, a member of the Paris Municipal Council, will move at the next meeting of that body a resolution to the effect that, seeing the importance of this interior decoration being conceived and carried out in a homogeneous manner and by artists of distinction, the administration be invited to study the question as a whole, and lay proposals before the Council for approval. The resolution will probably be voted, and must have a good effect upon the conduct of the work, which it is now seen cannot possibly be finished, as hoped, for July 14. A sum of no less than 2,000,000 frs. is standing in the estimate for artistic and decorative work still remaining to be done within the building. The decoration of the larger rooms is not yet commenced, and the plans for that of the Grand Salons and Salle des Fêtes are not even made out. The latter, the walls and ceiling of which are entirely bare, is being used as a workshop, wherein fifty stone-carvers are engaged upon the ornamental sculptures for the tribunes of the Salle du Conseil Municipal. In the Hall of St. John, where the drawings of the City of Paris Lotteries and Bonds will take place, men have just commenced laying down the marble floor, and Messrs. Gauthier and Gauthier, the sculptors, are working upon the caryatides. On the other hand, the outside of the building is almost entirely completed. All the statues, with the exception of three not yet delivered by the artists, have been raised to their places; on the side facing the Place Lobau the finishing touches are being put to the mosaic work of the top storey, and in a few days the exterior ailings will be erected, and the eighteen bronze doors hung. It is stated that several artists, natives of Alsace and Lorraine, propose to demand permission to decorate one of the large rooms of the building, which would serve as a perpetual souvenir of the lost provinces. The design would include escutcheons of the various towns of Alsace and Lorraine arranged in a frieze round the ceiling, portraits of French celebrities born in the two provinces, and landscapes of the local scenery. The artists in question offer to execute the work purely as a labour of love, and would not accept any payment whatever.

Three more of the newly-painted decorative panels at the Panthéon, or Church of Ste. Geneviève, have been uncovered during the past week. They are situated to the left of the altar dedicated to Sainte Geneviève, and represent further incidents in the life of the shepherdess of Nanterre, and patroness of Paris. The progress effected in the decoration of the edifice makes it probable that before August 15 all the frescoes of the Sainte Geneviève chapel will be finished. There will then only remain to be completed the paintings in the chapel of the Virgin, the two large panels to right of the chief entrance, and the mosaic work on the demi-vault surrounding the grand altar, the whole of which are expected to be finished before the end of next year.

The Institute, the classic home of the Academies, is being put into a thorough state of repair, both within and without. The restoration of the central dome is now completed, and the next work to be taken in hand will be the redecoration of the hall, in which are held the grand receptions of the French Academy. The cost of this portion of the repairs is estimated at 150,000 frs.

The experiments in the electric lighting of the Salle des Séances of the Municipal Council are being continued. The Swan lamps now in use will shortly be replaced by the Edison system, in order that a decisive opinion may be arrived at as to the respective merits of the two methods before the Council moves into its new quarters at the Hôtel de Ville.

ILLUSTRATIONS.

ST. MARY'S CHURCH, FULFORD.

THIS church, which is now being erected at the sole cost of His Grace the Duke of WESTMINSTER, is situated about five miles from Chester, on the Wrexham road, the site being just outside of the boundary of Eaton Park. The plan of the church consists of a nave, porch under the tower (which is placed at the north-west angle); chancel, and north and south transepts. The north transept is fitted up with the children's seats, and in the south one are the organ-chamber and vestry. The total accommodation provided is 277. The walls of the building inside and out are of local red stone, the outside scutch-faced and the inside chiselled. The roof, which externally is covered with brown Ruabon tiles, is composed of principals, purlins, and rafters, the whole of which, together with the rest of the woodwork, is of oak. The spire is of timber framing covered with oak shingles.

The east and west windows are to be filled in with painted glass by Messrs. HEATON, BUTLER & BAYNE, and the organ is being made by Messrs. WHITELEY, of Chester.

Provision has been made for heating the church by means of hot water.

The masonry has been executed in an admirable manner by Mr. GEORGE PARKER, builder, of Eccleston, and the woodwork is being carried out by the estate workmen, under the superintendence of Mr. POWIS. The architect is Mr. JOHN DOUGLAS, of Chester.

ORGAN CASE FOR MRS. O. BURKE, GORTMORE DUNDRUM, CO. DUBLIN.

THE case shown in the illustration is to be made of oak, and is to be executed by a Dublin cabinet-maker (Mr. SCOTT, of Abbey Street), his estimate of 288*l.* being the lowest of eight; the highest was 520*l.* The design is by Mr. THOMAS MANLY DEANE, architect, Dublin. The style is Italian Renaissance, treated rather freely and of a late type. The organ itself was built by Mr. TELFORD, of St. Stephen's Green, Dublin.

STUDIES FROM THE LIFE, BY M. LECHEVALIER CHEVIGNARD.

EDINBURGH ARCHITECTURAL ASSOCIATION

THE usual fortnightly meeting of the Association was held on Wednesday evening, the president, Mr. David MacGibbon, in the chair. After the preliminary business was disposed of, Mr. John Kinross, architect, Edinburgh, read a paper entitled "Some Notes on Italian Buildings." He prefaced his remarks by stating that the first feeling experienced after seeing several Italian towns was regret of the want of unity in design and in completeness of structure which so many of their best churches exhibited; and also that these incongruities put the different styles in strong contrast, and enabled one to judge their merits clearly. The lecturer pointed out that the salient internal features of the basilican churches of Central Italy are the great width of nave (so desirable in order that all may have an uninterrupted view of altar or pulpit); the rich effect gained by the close spacing of columns; the broad decorated surfaces and the apse conchas, with their figures of Christ or Madonna, might with advantage be adopted in our own churches, in order to make them "more attractive everyday resorts and resting-places"; and that the prominent external feature of the churches of Lombardy and Venetia, their great breadth of wall surface decoration with different coloured materials in course or geometrical pattern, would give something brighter and much needed in our cold streets. He then compared the Roman, Florentine, and Venetian palaces, showing that those of Florence have a grandeur suited more for civic buildings than residences, but that the Venetian ones have a grace and elegance desirable in residential buildings, and quoted the opinions of different authorities on the much disputed subject of the Ducal Palace at Venice. Reference was then made to the small houses found in the mediæval towns, more particularly in San Gimignano, near Siena, remarkable for their simplicity and fitness; and lastly, the tenements now being built for the middle classes in Rome, and their very solid construction was pointed out, external and partition walls being much thicker than usual here, and that the fireproof nature of their floors and roofs are of a sufficiently inexpensive character to warrant their adoption in this country.

At the conclusion a cordial vote of thanks was accorded to Mr. Kinross.

STUDY FROM LIFE.

STUDY FROM LIFE.
By M. LECHEVALIER CHEVIGNARD.

NOTES AND COMMENTS.

THE judges on Wednesday wisely upheld the award of the arbitrator in the case between the Countess OSSALINSKY and the Manchester Corporation. The Countess claimed 95,000*l.* for the purchase of her interest in land at Thirlemere, which was required in connection with the new water supply of Manchester. The highest valuation of the property which was made on behalf of the Corporation was 25,451*l.* exclusive of timber, while the lowest was 21,000*l.* Mr. HUSKISSON, of Everston, who was appointed sole arbitrator, assessed the value at 64,000*l.*, with contingents amounting to 4,000*l.* or 6,000*l.* The Corporation endeavoured to set aside the award on the ground mainly that the arbitrator had, "in estimating the value of the land, improperly taken into consideration the enhanced value, or the alleged enhanced value, by reason of the water that should be collected, diverted, and impounded upon the said land, and also by reason of its natural and peculiar adaptation for the construction of a reservoir." It was contended that the arbitrator was not to consider the capability of the land for the purposes for which it was required. If this theory were accepted it would revolutionise the existing principles of valuation in regard to both land and houses. The judges, however, opposed it, and approved of the dictum of the arbitrator when he said: "If land from natural circumstances is suited for particular purposes, that is an element of value and a fit matter for consideration." Besides, as their lordships said, the great advantage of arbitration was its finality, and lightly to set aside an award would be seriously to impair the value of arbitration.

As might have been expected, the Standing Orders Committee have refused to dispense with the Standing Orders to enable the Metropolitan Board of Works and Commissioners of Sewers to introduce Bills to amend or repeal the provisions of the Act of 1881, giving power to the Metropolitan District Railway Company to make openings in the Thames Embankment and other open spaces for the ventilation of the railway. It would be a novel precedent in Parliamentary practice if Acts could be so readily set aside, and the application was hardly made in earnest. The authorities were remiss at the right time, otherwise so absurd an enactment could not have passed through the two Houses. It should therefore be known that the responsibility for the hideous openings by which some of the best parts of London will be injured rests not with Parliament, but with the two bodies who are supposed to be the guardians of the amenity of the metropolis.

NEARLY twenty years ago a Free Church was erected in Kenning Park, Glasgow; but, as is not unusual, the tower was not completed. Lately, the tower was carried out, but not from the plans of the original architects, Messrs. BOUCHER & COUSLAND. The surviving partner took an action, in which the sum of 40*l.* was claimed as professional fees in connection with the work, on the ground that the firm was entitled to be employed to complete the original design. But one Sheriff decided against the plaintiff, and, on an appeal, a Sheriff Principal, on Saturday, took the same view. It was laid down that the facts did not support the pleadings, in which allegations were made throwing doubt on the *bonâ fides* of the defendants. The architect was accordingly mulcted in full costs. The allusion to the allegations would suggest that there was more in the case than the natural desire of an architect to see his work accomplished as he intended it to be. But it would also appear that *esprit de corps* is not stronger in Scotland than in England, or else why did another architect accept the commission for the tower?

THE Financial Secretary of the Treasury lately stated in the House of Commons that although one of the five designs for the Dublin Museum might be selected, the Government were not bound to select the author of it as architect of the building. The remarkable thing about this statement is that it reverses the terms of the original condition. According to the twentieth clause, "the committee of selection shall report to the Treasury upon the five selected designs, and the Treasury will

select the author of one of them to execute the new building;" or, in other words, it is incumbent on the Government to select an architect out of the five competitors, but it could be contended that he was to prepare a fresh design. Mr. COURTNEY's reply was so startling a discovery that it became necessary to investigate its conditions, and on Tuesday night he was asked whether, on a review of the case, he was still prepared to maintain "that no guarantee was given that one of the selected five should be the architect of the building." Mr. COURTNEY said, in reply, "that, under the tenth paragraph of the memorandum of the terms of appointment of architect, provision is expressly made as to what should be done supposing no one of the select five was appointed architect; and I, therefore, adhere to the conclusion that no such guarantee was given." It is plain from this that the Government have outwitted the competitors. They did not anticipate that there would be any variance between the spirit of the first and second set of conditions, or that the original guarantee was to be evaded. Under the circumstances, the prospect of those who may enter into the new competition is not assuring.

It is proposed to compile a history of the county of Worcester on a new plan. NASH's work on the subject does not come down later than the end of the eighteenth century. But it might be utilised for a great deal of the past history. The project now is to ask as many residents as are competent to co-operate in the preparation of a history which is to contain not only an abstract of the discoveries which have been made by investigation of old records, but what to many will be of more importance, information concerning the condition of the manufactures and people of Worcestershire. If the experiment is successful it is likely to be imitated, for there is a great want of trustworthy books upon English counties. It may be remembered that in Ireland the publication of works of the kind was commenced by the Government, as a corollary to the Ordnance Survey; but, owing to causes which have never been revealed, no more than one volume appeared.

THE conditions of the new competition for the design of the national monument to be raised by the Italian nation to the memory of VICTOR EMMANUEL are now published. They are too long for reproduction as a whole, but the following are the most important:—Art. 1. Artists of all nations may compete. Art. 3. The monument is to be erected on the north side of the Capitoline Hill, in perspective with the Corso, and on a line with the axis or central line of that building. Art. 4. The monument is to include—(a) An equestrian statue in bronze of the King, situate in an exact line with the axis or central line of the Corso. (b) An architectural background, which, as it has to shut out the view of the buildings behind, must have an elevation of at least 23 mètres over a width of 30 mètres in the centre, and of at least 24 mètres over the remainder of the edifice. The design and form of this construction is left entirely to the discretion of the artist, who must, however, take into account the perspective effect of the sides. (c) Flights of steps, giving access to the esplanade upon which the monument is to be erected. Art. 6. Competitors must submit—(a) A model, measuring 32 inches in height without counting the pedestal, of the statue. (b) Sketches of their designs as a whole, on a scale of $\frac{1}{200}$ th for the ground plan, and $\frac{1}{100}$ th for the elevation. (c) Detailed plans of the monument in $\frac{1}{40}$ th scale, including the statue and the central part of the architectural background. (d) A description of the work and a detailed specification, drawn up, as far as regards the buildings, from the list of prices attached to the contract for the works rendered necessary by the removal of the seat of Government to Rome. No estimate is, however, required for the foundations, to which a total sum of 1,000,000 francs is devoted. Art. 7. The cost of executing the work must not exceed 9,000,000 francs; this sum to include the construction of the buildings, foundations, &c., as well as all sculpture, painting, and other decorative work. Art. 8. The designs must either bear the name and address of the competitor, or a device, a duplicate of which is to be enclosed in a sealed envelope together with the name and address. Those envelopes will alone be opened that belong to prize-winners in the competition. Art. 9. All designs must be sent in at latest on or before December 15, 1883.

THE EDINBURGH ASSOCIATION SKETCH-BOOK.*

THE architecture of his own country should never cease to have interest for a student. There is much to be said in favour of the study of foreign work, and it may have a close connection with the style that happens to be popular; but however fashions vary the admiration of the old buildings which we have in Great Britain should not be left altogether to archæologists and amateurs. We are, therefore, glad to find the members of the Edinburgh Architectural Association persevering in the publication in their sketch-book of drawings of old buildings which are found in Scotland. The third volume is larger than usual, and consists of fifty plates. The sketches vary in merit, and while there are none which can be compared with the plates in Mr. Kinross's Italian sketches, or with Mr. Hutton's sketch of the crown of St. Giles's Cathedral, Edinburgh, lately published in *The Architect*, there are several which are so roughly drawn that it is difficult to believe they are accurate. Scotland has as good draughtsmen as England, but probably they are not members of the Edinburgh Association, or they have been overlooked by the committee when materials were sought for the last volume of the sketch-book. Whatever may be the reason, the plates before us do not represent the average draughtsmanship of the North.

The subjects belong to many periods, from the early Romanesque churches to eighteenth-century mansions. But it would have been an advantage if some particulars had been supplied respecting the history of the buildings. In Scotland there may be little or no need of the information, but it is different in England. Gazetteers are not always trustworthy, and many of the buildings are in out of the way places, which are not even mentioned in works of the kind.

The first building we find in the book is Dalmeny Church, a small but typical twelfth-century building, which is adequately shown in full detail on six plates by Mr. J. T. Hetherington. The corbel heads are curious, and there is a bold chancel arch. The two most perfect Romanesque churches in Scotland are, we believe, Dalmeny—which was a manor of the Anglo-Norman family of Avenel—and Leuchars. Both have the semicircular apses by which they are differentiated from English churches of a corresponding period, and it may be mentioned that a view of Dalmeny church appears in "Chambers's Encyclopædia" as an example of an apse. Mr. F. W. Lyon, who seems to possess a rich collection of sketches of Scottish mansions, contributes views of Roslin Castle, Leckie House, Grandtully, Scotts Tarvet, and Fawside. The Montgomerie Monument in the parish church of Larges is a fine Italian work, but the drawing by Mr. J. W. Parsons seems like some others in the sketch-book to have been done in a hurry. In another drawing by him we find two old-fashioned high-backed chairs, one of which is supposed to have been made from the wood of Admiral de Witt's ship. Mr. J. W. Small's two drawings of a part of Linlithgow Palace are geometrical, and are to be preferred to rough sketches which are supposed to be picturesque. Mr. Anderson's two plates represent St. Ninian's, Whithorn, and, whatever may be the value of the remains, the site is one of the most hallowed in all Scotland. Ninian or Nynius rescued the North British tribes from idolatry, and, after a visit to Rome, he built a church of stone at Whithorn in a way that was said to be unusual among the Britons. It was dedicated to St. Martin of Tours, and for centuries was a shrine which attracted people of all ranks from abroad. The interest of the remains was not recognised by Scottish archæologists until one of the Tractarian writers identified the site and explained its historic importance. The doorways shown in the plates have remarkable symbols on the voussoirs, but the meaning of them is a puzzle. The two Fife steeples drawn by Mr. Lyon have also an historic interest, but it is of a different kind. One belongs to the church of Dairsie, and displays some unusual corbelling. This building was erected by Primate Spottiswood, in order to manifest to his countrymen what a church after the English form should be; but it must be owned that it was not a good model to be set up for a pattern. The name Restalrig excites some associations, but the building sketched by Mr. Dewar has evidently been neglected, as if it were useless. It is filled with rubbish of unknown depth. Mr. Dewar is, we believe, a clever man, but his style of sketching will be always a

bar to his success. This building, as well as those at Newark, Balgonie, and Lundin, exemplifies his mannerism. He puts down a line here and there, and leaves the spectator to form a whole out of the chaos. Everything is sacrificed to attempts at producing shadows by coarsely-ruled lines. If Mr. Dewar would restrict himself to outline drawing, he might do justice to himself. The old wrought-iron work drawn by Mr. Schultz, from examples that are to be found near Edinburgh, is without the broken-backed curves that are common in English work, and for which the only explanation that can be offered is that they were supposed to form the letter G, and thus to express loyalty to the throne. A more elaborate specimen is the gate at Gongar House, in which the rose and thistle are introduced, the latter being a rather difficult thing to forge. Mr. A. W. Anderson sketches the iron railings around the tomb in the collegiate church at Bothwell. The bars are bent so as to form vase-shaped openings. The subject of another sketch is an iron bracket for the support of the baptismal basin in Lyne church—from which a pulpit, dated 1644, is also taken. A Renaissance doorway from the Auld College, Maybole, is sketched by Mr. J. Wallace. Mr. R. Watson gives one from Dundrennan of a different character, and Mr. P. N. Scott selects a third from Inchmahone Priory, which is accompanied by a description. A house in the Lawnmarket, Edinburgh, furnishes a fine seventeenth-century fireplace and mantel, with fluted pilasters and panels. The drawing, and one of Queen Mary's sundial at Holyrood, are by Mr. R. W. Dick. There are some "bits" by Mr. Menzies from an Italian cabinet in Gala House, as well as a curious old Dutch cabinet. Mr. Small contributes sketches of a massive oak press in Rowallen Castle, and an entrance door and door-heads from Hamilton Palace. There are some curious examples among the sketches of woodwork by Mr. R. R. Anderson, A.R.S.A. The carving on the door from Amesfield Castle represents, among other things, a man in sixteenth-century costume, wrenching apart the jaws of a nondescript, that is a compound of hog, poodle, and bird. The subject may be Samson and the lion. There is also a good drawing of the ruins of Lincluden church, near Dumfries, which must have been a good example of the Scottish Decorated. The remains of northern military defences are not numerous, and Mr. T. Ross does well in putting on record details of the fortified castle of Borthwick and of a fortified grange at Haddington, which is over half an acre in area. Modern improvements are supplanting the little that is left of Old Glasgow, and there may be many inhabitants of the city who are not aware of the existence of the old houses in Nightingale Close, which are drawn by Mr. J. C. T. Murray. A curiosity in its way is the shutter-board from Aberdour Castle, and the capacious fireplace, although the masonry over the lintel is rather clumsy. Mention should be made of the sketches of the mortuary vault at Walston, which is seventeenth-century Gothic, and the doorway of Lamington church, to which the jousts are still attached, although they have ceased to be a terror, both by Mr. H. F. Kerr; and the Lumsden monument in Crail churchyard, dating from 1598, which is of a somewhat original type of memorial. The sketch by Messrs. Bonnar and Waterston, jun., of the coloured decoration on a roof at Culross is a characteristic piece of work, in which emblems of the virtues are introduced, with sundry wise saws for the edification of the inmates. From this catalogue it will be evident that the subjects of the plates have been selected with judgment.

INTERIOR DECORATION.*

THE "Studies" by Mr. Batley can be considered from two points of view. We can criticise them in their pictorial aspects, and as designs for furniture and decoration. In both forms they will sustain examination. The etchings are excellent, and with such drawing and management of light and shade defective furniture (which Mr. Batley's is not) would assume picturesqueness. People who are not thinking of ordering fresh furniture, and who have to be content with the decoration their landlords will grant under pressure, can find pleasure in looking at the plates. May not a nineteenth-century house have a glamour thrown over it? There is no reason why the etcher's art should be restricted to old buildings and the landscape and figure subjects which are most

* Sketch-Book, Edinburgh Architectural Association. Vol. 3. 1880-82. Edinburgh: G. Waterston & Sons.

* A Series of Studies for Domestic Furniture, Decoration, &c. Designed and Etched by H. W. Batley. Published by Sampson Low, Searle & Rivington.

generally selected for representation. Many of those subjects depend for their interest on the introduction of ruin or decay. But art is, or should be, regardless of time, and if it be possible in rich men's houses to have beauty and grandeur, it is not necessary to wait until the objects are old before they are shown on a copper-plate. Mr. Batley's interiors are all modern, and new and costly, but critics who would undervalue them in consequence must be either over-enthusiastic about antiquity, or carried away by what has been well called the "pathetic fallacy." The plates form a series of pictures which are so artistic that they appeal to the imagination, and they are so good as to be capable of being employed as suggestions for backgrounds in pictures. Mr. Batley is no novice in designing furniture and decoration, and in his studies he shows objects corresponding with those which figure painters very often lose time in endeavouring to produce whenever an occasion demands their use.

The studies have also their utilitarian aspect. They can be made the means of inspiration, although so-called practical men are likely to object that there is a difficulty in applying scales to the figures, and that there are no full-size geometrical details. Men of that class have an aversion to the labour of thinking, and they are always willing to patronise (especially if the price to be paid is moderate in amount) compilers and publishers who supply them with drawings that can be copied without alteration. But fortunately there are artists who will recognise a kindred spirit in Mr. Batley, and will employ his studies while they endeavour to surpass what he has done.

The designs, although most of them might be employed in the same building without appearing to be at variance with one another, show the influences which have been in the ascendancy during the present generation. There are traces in them of Gothic, Japanese, and Renaissance work, and probably of other styles. The author in a few words of preface explains the spirit in which he worked: "The Gothic revival some years back, although sound and good in its way, was," he says, "soon found to be too heavy and severe for domestic use, except for very special purposes. We have naturally dropped into a more comfortable, easy, a more wooden and less stony style of furniture and surroundings, yet still keeping the early principles of sound construction and honest work." The first design represents a vestibule or hall formed of woodwork, carving, tiles and stamped leather. In the centre panel is a massive swag, but with flowers and leaves of more definite character than is usual in such forms, and in the space over the swag is a swallow. There is a deep frieze filled with fruit and leaves, divided by caryatids in low relief, their outspread wings and flowing hair forming a kind of bracket. The notion is rather quaint, and in favour of the arrangement it must be said that the cornice does not seem to be entirely supported by the hands of the figures. The wall-space is well divided by horizontal and vertical lines, which express strength and make the decoration appear subsidiary to construction. The second design is a very rich staircase, in which armour and family portraits are combined with stained glass, furniture, tapestry, and surface decoration, forming a rich *ensemble*. Next follows a dining-room, which is Egyptian in style. It is certainly ingenious in treatment, and there is an entire absence of the heaviness that generally characterises modern adaptations of Egyptian. But we doubt if the style is ever likely to be popular, for it would inevitably suggest the appearance of the mummy and the predictions of the priests, the thought of which would be enough to chill the most agreeable party. There are ten etchings in all, and the remainder are mainly filled with work which may shortly be described as being among movables. In one plate, besides some suggestions for a dining-room frieze, are a *repousse* scone, and a quaint corner bracket for china and glass. The subject of another plate is an elaborate mantel-piece, the original of which was exhibited in the Paris Exhibition of 1878, where furniture designed by Mr. Batley was much admired. The corner cupboards, brackets, and clock cases which are shown in the next etching are in a style that would correspond with Eastern pottery. The eighth plate contains designs for curtains or *portières*, in which the Japanese spirit has been realised, but without slavish imitation. A fine dwarf cabinet is given on another plate, which combines with a series of hinged frames to hold etchings and drawings, and with a deep Japanesque frieze above so as to form a complete scheme of decoration. The deep frames of the drawings in this case become part of the archi-

tectural design, and the arrangement is very effective. The last plate is a design for a stair-head, in which the newel is carried up to the roof, and the walls are panelled and are intended to be filled with stamped leather or painted decoration. The whole of the designs have been carefully worked out, and are evidence of skill that is the product of artistic training, experience, and natural ability. From their treatment the etchings deserve a place in the portfolios of collectors, and they would give grace to the premises of furniture manufacturers and decorators.

TRUE ART.*

BY JAMES ORROCK, M.I.P.W.C.

CARLYLE says: "The gifted man is he who sees the essential point, and leaves all the rest as surplusage; it is his faculty, too, that he discerns the true likeness—not the false, superficial one—of the thing he has to work in. To the mean eye all things are trivial, as certainly as to the jaundiced they are yellow. No more gifted eye can exhaust the significance of any object. In the commonest human face there lies more than Raphael will take away with him." Again, in speaking of Shakespeare, Carlyle says: "It is not a transitory glance of insight that will suffice; it is a calmly-seeing eye—a great intellect, in short. He must understand the thing"; and "to the poet, as to every other, we say first of all, see." These searching words of the great philosopher who has recently passed from among us apply with equal force to the painter as to the poet.

In these days, when the art of painting has not only become a fashion but a fever—when everybody discusses art, and almost everybody practises it—the reflecting connoisseur pauses and wonders what will be the outcome of so much zeal. We seem now, in consequence of schools of art and literary teaching, to have the prospect of having so great a multitude of so-called artists that it becomes a matter of serious question whether even England in her best days of prosperity can hope to support them.

The contrast between these times and those, for instance, of Crome and his contemporary landscape-painters is indeed startling. He, we all know, although one of the greatest of English masters, was despised and neglected, whereas nowadays a scrap "done on the spot," as it is called, will frequently command as high a price as that which Crome received for one of his best works. Is painting, then, in consequence of the modern system of wholesale art instruction, an exception to the sister arts of poetry and music? We all freely admit that no education can produce a true poet or a gifted musician; but education is, of course, a mighty help for the bringing out of genius when it appears. On every side, however, in these days, when art is taught methodically and mechanically, we are told that we are surrounded by a cloud of geniuses. If this be true, then picture-painting cannot, after all, be so rare a power as we have always been led to suppose. But is this really the case? Have we now, in truth, multitudes of great painters among us? or have we even as many now living as we had during the half-century which preceded the establishment of the Kensington School of Art, or prior to the time when literature became an art-instructor? In those days lived Turner, Etty, Wilkie, Crome, Cox, Dewint, Constable, Linnell, Landseer, Müller, Bonington, Barret, and before them Reynolds, Hogarth, Gainsborough, and Wilson. These are great names; but, in addition, there were many who stand almost as high on the scroll of English art. Those masters did not paint because it was the fashion or "the correct thing," for the landscape artists (England's greatest men) had to pick up their knowledge as best they could, by carefully analysing and studying, when opportunity offered, the works of the great masters who had lived before them—to my thinking the only safe and sound mode of study, in conjunction, of course, with that of nature.

The great feature of the present times is so-called mechanical skill—smoothing, dotting, hatching, and mapping, and, above all, painting the startling effects of nature in a black and white key; modest, retiring work, like nature's own modesty, being at a discount, especially in a public exhibition. The demand is for smiting effects, or mechanical elaboration of the surface truths of nature. Picture composing, as in the days of Turner and other masters, is now reduced to painting bits from nature, and anything will be cried up so long as the work looks real, like scene-painting half a dozen yards off. The art of painting, as practised for centuries by the masters, is simply ignored and looked upon as obsolete. The cry is, "Get out to nature, get out to nature!" Take a sketching-umbrella and painting gear, and you are safe. Anything whatever "done on the spot," whether you are skilled in the art of painting or in the use of the materials or not, must be right, as if nature's beauties and effects were all of equal artistic value, and needed no selection whatever.

We are told nature will, in a word, do everything for us, so

* A lecture delivered at a meeting of the Society for the Encouragement of the Fine Arts.

throw overboard at once all that has ever been painted up to this great time. Reasoning from analogy, I should say that, like poetry and music, something more was required than a dictionary and a musical instrument. Plainly, then, and emphatically, the art of landscape-painting is not taught now, nor is it practised as an art except by a few. A quarter of a century ago we had great masters teaching for a living, not only in London, but in the provinces. The greatest of them had pupils, and, of course, taught their art as masters only could. What would some who love the great art give now if they only could be privileged to have a few lessons under the direct guidance of some of the great English painters whose names are household words—when instruction was direct, in the shape of a picture or drawing being painted before you; when old Crome of Norwich taught, and Cox and Dewint, and Copley Fielding, and Prout, and Hunt—not to go further back—and have a few solid and sound courses of training from brave old John Varley, the instructor of most of the luminaries of the great school of English water-colour painting?

The truth is that now not only have we no teachers of that art which Turner learned and mastered, but our schools for the most part do not even possess ordinary examples of any of those masters' works. I have lately been informed that at several important art schools the pupils have to be contented with chromo-lithography, photography, and bad drawings. Surely this wholesale business lacks the vital element for the cultivation of true art? Again, in Wilson's and Gainsborough's time there were few painters of any kind, and those few painted, not from fashion, but because their peculiar natures were restless and unhappy without it. They were amateurs, in fact, and in the highest and purest sense of the word. One wonders how much fashion and hope of professional place, together with the pleasant life, go to swell the ranks of artists in these days! It would be curious to see a list of painters' sons, and other relatives and friends, and those also of collectors and people whose lives have been engaged in art matters, who have simply taken to art because their lot happened to be cast there, for we know that nowadays multitudes take to art as they might to law or physic, and who at the outset would have chosen either profession as a matter of absolute indifference. Fancy choosing poetry or music as a profession without any particular bias in that direction! The fact is, mechanical art is comparatively easy, and, like plan drawing, it can, with a fair amount of practice, be readily acquired. One wonders how many among the living legions will take rank with those great ones just named, who painted pictures for the same reason that Burns or Byron wrote their verses. I have often tried to count the number of young men who became painters in consequence of their intimacy in early life with an eminent English master of one's own acquaintance, and whose genius announced itself from comparative darkness.

I have actually heard audacious men, who call themselves connoisseurs, openly declare that the great landscape-painters of England have passed by, and that Turner and all his brother painters who have made England famous produced their matchless works before literature and the art-teaching companies began. I have, moreover, heard that same profane authority boldly and fearlessly assert that after all that has been written and taught (in place of the direct personal teachings of those great men), not one in 50,000 knows one of their pictures when it is put before him; and, further, that Turner and others had their high places assigned to them before anything was written about them at all! That same individual, calling himself a judge, insists that he and his brother judges knew all about Turner's power and that of the other great painters without the help of any literary teaching whatever; and consequently that literature, however classic and poetic, has as much to do with painting and its practice as it has to do with music and its practice. Lastly, this audacious man persists in saying that, without the aid of him and his brethren, the subtle art would never have been recognised at all, and he will prove this at any moment by simply testing the knowledge of the majority of artists, and of course of the public, by their appreciation of the quality of the finest landscape and figure-painting.

It is absolutely certain that the great painters of our own school, and many of the best in past times, when they painted broadly, were never appreciated by most artists, nor of course by the general public; and it is only when a broad painter and colourist is acknowledged by the judges that he becomes fashionable and his works are purchased at high prices. This accounts for the vast multitudes of spurious works of these masters being everywhere palmed on the public; and it is simply laughable to see hosts of so-called Coxes, Dewints, Cromes, Müllers, &c., which are hung for inspection, with no other recommendation than the name which the possessor has so frequently heard. No broad painter, therefore, be he never so excellent, can hope at the outset for a hearing, and even broad painters, who are coarse and vulgar, not unfrequently usurp the place of the true ones—hard lines certainly for the genuine painter.

But who is this so-called connoisseur who takes so much upon himself? Popularly he is considered greatly inferior in knowledge to the merest tyro in art, and this because he does not practice painting; popularly he is considered nothing more than an expert, which means a man who knows the handwriting, so to speak, but cannot give judgment on the subject matter of the theme, whether

it be poetry, painting, or anything else. Now is this really so? I think I can prove to you that it is precisely the reverse. Carlyle contradicts the statement of the witty Frenchman, that "no man is a hero to his *valet-de-chambre*," and says, "for the valet does not know a hero when he sees him! Alas, no! it requires a kind of hero to do that; and one of the world's wants, in this as in other senses, is, for the most part, want of such." Yes, these words of Carlyle are true, for in art there are almost as few fine judges as fine painters. This is a startling assertion, but nevertheless a true one. If it were false, then the greatest of our most gifted painters, mostly landscape, would, instead of pining a lifetime, have had their places assigned to them at once. But with nearly all our greatest landscape painters it has ever been their doom to suffer neglect and scorn, and that sometimes through their whole lives. Who, then, kept them out of their birthright? The majority of artists in high places and nearly the whole of the now admiring public! The connoisseur, therefore, as Carlyle says, is a kind of hero, for, although he cannot produce the work of the genius, no matter whether he be an artist or not, he is at next best, for he can at least appreciate it. He may, in the words of our philosopher, be said to be the "silent man," possessed of strong inward feeling, but without the power of utterance—that is, without the power of painting. There are two kinds of instinctive judges: he who paints and is a judge of other artistic power out of his own line, and he who judges but cannot paint; and it is not too much to say that the non-painting connoisseur is always a safer and better judge than at least fifty out of a hundred artists. The reason partly is that few artists take any interest in other branches not practised by themselves; and there are hundreds who do not know the pictures in our own National Gallery of almost any other master except those in their own department of art. This, of course, also applies to modern exhibitions, and it will hardly be believed that many painters in oil, even of eminence, not only do not know the works or names of some of the best of our water-colour painters, but they have never actually been in their galleries. The connoisseur, on the contrary, is constantly studying the peculiar beauties of the finest art, no matter by whom produced, or in what material. Of course the painter-connoisseur is the better man always, although, as I have said, most people think that to be a true judge of anything, that judge must be a practical man. If this were so, the landscape-painter should have no judgment of the works of a portrait or figure-painter, and for such a man to appreciate a picture by Reynolds or Vandyck it would be necessary to have the power to paint one, and to thoroughly enjoy and understand the beauties of a tazza or cup by Benvenuto Cellini he ought to be able to design and make one! The simple truth is that any great master's work is hopelessly beyond the power of any ordinary artist to execute, but does this prevent his appreciation of it? Most certainly not. The finest landscape-painters are always fine judges of colour and artistic feeling, and to be a first-class landscape-painter, as I shall presently show, the artist must be himself a colourist, for on this, and almost on this alone, his rank depends. No great landscape-painter has ever been other than a colourist, and his most searching qualities are always to be found in his silent or neutral tints. All the great painters for centuries—figure, landscape, and all else—have invariably been colourists, and I for one hold that this peculiar power is the chief bond of union between them throughout. A careful study of this will prove what I say.

The connoisseur, therefore, be he painter or otherwise, has always this peculiar instinct; for it is born with him, so to speak, and no amount of training and hammering will ever create this inherent faculty. You might as reasonably hope to give tune where that gift is absent. Besides all this, the true judge, from his peculiar nature, is ever on the look out for that which answers to his instinct, and by such a process of cultivation his perceptions are quickened. The connoisseur, then, is one of the most valuable of men, for through him and him alone the great art of the world has been religiously preserved. But of course all judges have not equal social influence; and many are of retiring habits, and may not have opportunities of recommending, or the means of purchasing, what they know to be fine.

I may here remark that, curiously enough, almost without exception the best and most searching judges I know never appeal to literature as a help to their judgment of painting; on the contrary, they judge on the merits of the work alone, and when disputes arise—which happen almost daily—books, no matter how poetically written, are never consulted; and this for the plainest and best of reasons, that no word-painting can supply the place of the keen perception of the subtle qualities which are alone found and expressed in the work itself. Many of those judges are non-painters, but give their opinions with almost unerring instinct.

Figure-painters, as a rule, have greater attractions for the public than landscape-painters, especially if they represent scenes of interest in everyday life. Human interest, in a word, has always the attention of the public, but it by no means follows that figure-pictures of great popularity are of the highest class in fine art. In the case of Hogarth's *Marriage à la Mode*, or Wilkie's *Blind Fiddler* or his *Distressing for Rent*, we have popular subjects and fine art combined; but these pictures are popular solely on account of their subjects. In the *Bacchus and Ariadne*, by

Titian; *Peter Martyr*, by Bellini; *Crossing the Brook*, by Turner; or the portrait of *Philip IV. of Spain*, by Velasquez, the fine art alone is the attraction. Policemen are never needed to keep the crowd from pressing forward to see those masters' works.

The connoisseur, therefore, conserves the fine art, and the public have to take on trust what he says, as they indeed must in all branches of literature and science. In process of time the great names become known and are echoed everywhere, but at no time whatever are their works intrinsically understood by the masses. Thus it happens that Turner is talked about, and his genius eloquently descanted upon; and many who have read with delight Mr. Ruskin's poetic prose writings feel that they know much about Turner and his pictures. Not one, however, in fifty thousand can tell you a real from a false one.

(To be continued.)

THE BISHOP OF CHICHESTER ON CHURCH-BUILDING.

ON Saturday last additions to All Saints' Church, Lewes, were consecrated by the Bishop of Chichester. The additions included a chancel and large east window. The plans were prepared by Messrs. W. Bassett Smith and E. J. Munt, and the stained glass was executed by Messrs. Clayton & Bell. The bishop, in addressing the congregation, said he remembered, some eleven years ago, preaching almost from the same place on a similar occasion. Then the church had been greatly improved at a considerable cost. But a heavy weight lay upon the improvers of that day. They inherited a building which, he might say, it was almost impossible to recast so that it should in any way satisfy the fair requirements of religious tastes. They knew that an ancient church existed at that spot for centuries; how it was formed they could only guess. The tower is still preserved, and showed that the fabric had been one of considerable size and solidity. But the last century was not favourable to church architecture; and it would seem as if a true feeling of what is seemly and beautiful in Christian art had wholly died out, and that the style and form of Nonconformist meeting-houses approved themselves to Church people, instead of following far more ancient and better models. After that manner the Church of All Saints' was rebuilt, but he did not question the good intentions of the people of that time; nor did he deny that they executed a very useful work. But they might be allowed to regret that the church architecture had been so wholly lost, and that the fabric, ugly and ungraceful, should have supplanted what in all probability was a church not wholly destitute of beauty and of architectural sweetness. It was some consolation that better and sounder principles had now been thoroughly established, and that such a rebuilding as had taken place would be much appreciated. What an advance had been made both by architects and those who set them in motion in our times! What advance had been made their new chancel abundantly testified. Even within his own memory, now reaching back some sixty years, no one could have been found who could have designed, and no workmen could have executed, this fair addition to their church. The genius which could plan such works was not yet awakened; it existed, no doubt, but it was sleeping; and the zeal and self-denial that furnishes the means was dead. When a church was to be repaired, what was the first question of the parishioners? It was, How can we do this work at the smallest expense? And when a church was to be enlarged, this was the other question, How can we provide the accommodation required at the smallest outlay? And where did the builder and the architect seek their examples, and where did they draw their inspiration from? Not from the glorious cathedrals of our native country; nor from the beautiful village churches still standing everywhere, but were given over or almost generally neglected; but from some heathen temple, some Roman, some Grecian palace alien to our country and unsuited to the requirements of public worship. They still saw the remains of what he might call the Pagan taste in the city churches of the last century and the early portion of the present. They knew that these outward things were available as helps only to the inward spirit and expression of faith and piety, but viewed as such they were precious. And so he might say that there was something wanting in the man who had not some reverence at the sight of the vaulted roofs and the lofty arches of our grand old cathedrals. At the recent installation of the Archbishop at the Metropolitan Church of Canterbury, he supposed there was scarcely one in that great multitude who did not feel that the grandeur of that magnificent temple added to the solemnity of the day. That was the impression made on that assembly of English Churchmen, but the feeling was of no value unless it led to a far higher and nobler temple, made without hands, eternal in the heavens. Let them therefore, not despise the outward material things when they seemed to exalt their spiritual convictions. For that reason he could not think it an indifferent thing that our churches, as they are religious in their purpose, should bear in their very front the seal of religion; they should be such that no man could possibly mistake them for any building such as men rear for their own con-

venience, or such as are provided for secular uses. They should proclaim their separation from worldly things, and, as it were, cry aloud, "We serve not the worldly, but the heavenly." Churches stand very thick in our cities, and perhaps, to their present judgment, they were disproportionate to the population. The contrast was very remarkable when they observed how rapidly they had sprung up in England, and nowhere more rapidly than in this favoured county and diocese. In the new towns the streets were large, and the inhabitants were lodged (many of them) in sumptuous houses, and enjoying a degree of comfort that their fathers never enjoyed. But the houses of God were scarce—few and far between—and the heaven-directed spire was wanting. Why was it so? Were they inferior to their ancestors in wealth, in numbers, or in the power of association? The wonderful works that were performed in our own times bore witness to the inexhaustible perseverance of the English character; but must they confess that their zeal for the churches and their religious wants is very much less than in days far inferior in knowledge, and smaller in resources? Were they content to enjoy the churches built by the munificence of previous benefactors? and were they to do nothing themselves for themselves? Certainly that was not a fair and just view of Christian duty. There were many ways of doing good, but were they to place the building and enlargement of churches low in the scale of good works? To do so would be contrary to all reason, and contrary to all Scripture, for no work more distinctly regarded the honour of God, or more directly promoted the interest of men. Nowhere in Scripture is it revealed that He is pleased that man should have an unworthy sanctuary. Parsimony in His services, and in the building of His temples, was condemned. Men were willing to spend largely for their own convenience, for their own luxury, but they only thought of retrenchment when the house and worship of God were concerned.

FINANCIAL ASPECTS OF THE BUILDING TRADE.

THE interests in the building trade are immense, says the *Pall Mall Gazette*, but it is hardly proper to call it a great trade, for it is so divided and so partitioned off into local industries and interests. It is more properly a multitude of separate trades. One section of the building industry may easily be prosperous while others are depressed; a great deal of money may be extracted from building speculations here, and much lost there. The trade does not move as a whole, and in many ways it would be useless to regard it as a whole. Still, the immensity of the interest is worth notice. In the United Kingdom the annual value of dwelling-houses is 115 millions, apart from bridges, churches, and other public edifices, from which it is possible to estimate the existing capital value of all buildings in this country at something like 2,000 millions, or about 60*l.* per head of the population, which is not far beyond the mark. Reckoning annual extensions at 2 per cent., here is a yearly builders' bill of 40 millions, without repairs and renovations, and without counting the interiors, on which modern expenditure is so lavish. Over 600 builders' failures take place yearly in England, and last year the number was 6 per cent. of the whole number of wholesale and retail failures, from which it would appear that building must be either a very important business or a very unsound one. In truth it is both. There is no evenness in the business, but a great number of diverse speculations, which mainly consist in fixing capital in a given place without the power of removing it if the expected demand does not come forward, and which form in the aggregate a large part of what is generally called the building trade.

In France, where the state of the building trade has lately furnished occasion or pretext for political agitation, the interest is also an enormous one. The *Economiste Français* lately estimated that a sum equal to 46 millions sterling had been spent in building speculations during the two years 1881-82. After 1870 there was throughout France a demand for the means of building, or rather rebuilding; in Germany also a building fever raged; but then it was hardly any trade which was not stimulated by the return to peace after the great struggle. Apart from such events, there is seldom room for extensive inflation in the building trades; the circles of inflation and depression are limited, and distinct from each other. For example, the rebuilding of Alexandria, a very important local event, will hardly affect the price of building labour and materials in Paris or London. If, on the other hand, a tea ship were to go down, or a large bonded warehouse to be burned, the relative scarcity of tea would at once be felt more or less in all the chief tea centres of the world; but demand and supply in the building trade do not tell upon so wide a surface. Little inflations, local crises, local depressions, are continually to be found; any general movement in building affairs, very seldom. The building trade is very different from the cotton trade, for instance, in that its fluctuations are local, and therefore limited. If cotton were very scarce, not only would the mills of Lancashire feel the deficiency, but those in the various countries of the Continent of Europe, in India, and in America would be affected also. This is hardly so with the materials for building, which are in the

main too heavy to be carried far, while labour is not like water, finding a common level, but special, difficult to move, tied by human associations, skilled only in particular grooves of work. On these grounds the depression felt in the building trades of Paris may be regarded as a local depression.

Last year Paris was an active centre of building work. During the time of Baron Haussmann, whose gigantic undertakings were under Imperial sanction, the octroi duties on building materials brought into Paris were never more than about 14½ million francs; but in 1882 they exceeded 19¼ million francs. This increase is partly due to the fact that, wages having risen high in Paris, contractors had to get ready-made doors, windows, &c., which they could do more cheaply, from the provinces; but the facts, however explained, show that the building of houses in Paris had last year attained an unsafe pitch. There is much ground for believing that the building trade of Paris has reached an inflated stage. That is to say, wages are far higher—40 to 60 per cent.—than in 1876; the quantity of houses available seems to be excessive; and there is some appearance of financial flurry among the various banks, so-called, which have been lately going into the business of lending on house property. Chief among these last is the *Crédit Foncier* of France, which, according to a recent balance-sheet, had outstanding loans aggregating 62 millions sterling on mortgage of house and other property, besides communal, or, as we should say, municipal, loans of half as much again. Fortunately the *Crédit Foncier* of France is not a bank, as we in England understand the name, which has deposits payable on demand; its liabilities are not capable of being made pressing in that way. Otherwise there might be a grave financial panic, attended by runs and stoppages of payment. It is to be hoped that other Paris banks who have locked money up in loans on *immeubles* are equally well sheltered; but a crisis in the Paris building trade is still possible, and the financial effect is not yet discovered of the difficulty of speculative builders, the disrepute of their bills, and the contraction of loans by the *Crédit Foncier*. As yet there is little sign of actually diminished building in Paris, but the requests for permission on the municipal registry have notably fallen off from 580 in the first eleven weeks of 1882 to 324 in the corresponding period this year, and this is a premonition of a crisis. We should hesitate to say it cannot be tided over, and managed as they know how to manage affairs in France. Whatever discontent and trouble may arise in Paris from the check to inflated wages it must be local as regards the trade. The financial effect—the effect on capital—may not be strictly local. Capital has come to be international. It is seen, above all, how immense is the annual amount of capital sunk in new building. If capital is frightened away from Parisian house speculations for a time, it will congest somewhere else. But what has to be kept in mind is the fixed liability of some of the financial concerns whose assets are tied up with the value of Parisian bricks and mortar. A fall in the value of their assets might cripple their power to sustain credit and prices in French financial markets, and so affect others.

CYPRIOTE ANTIQUITIES.

ON Saturday afternoon the public were admitted to view in the lecture theatre of the South Kensington Museum parts of a valuable collection of Cyprian pottery, sculpture, and other antiquities, which has been lately secured for that great national repository. The finder of the whole, who lectured on the occasion, the director, Sir Philip Cunliffe Owen, C.B., in the chair, was Mr. George Gordon Hake, whose archæological exploration of the island between the months of January and October last year, unearthed them from the tombs at Salamis, Carpas, and Curium. Mr. Hake began with an account of the various races which dwelt in Cyprus from the earliest ages and of the neighbouring nations, which, either by conquest or commercial intercourse, exercised a strong influence over its people. It was now generally acknowledged that the indigenous race was of Aryan and not, as was formerly thought, of Semitic origin. This was proved by the language in which the long Idalian inscription, already deciphered, was found to be written, as well as by its characters, which were closely akin to the Lycian. The first conqueror known to history who subjugated the island was Thothmes the Great, who reigned not later than B.C. 1500, and the Egyptians held it for three centuries down to Ramses III. It afterwards fell to Phœnicia, Assyria, Persians, Ionians, Macedon, and Rome. A few words were added on the government, religion, and social aspect of the people during these ages of foreign rule. Often it was split up into petty subject kingdoms, each with its autocrat, jealously safeguarded by spies. Side by side with these were the powerful priestly families, such as the Cinyradæ at Paphos, whose temple of Venus enthralled the whole island to the religion of lust. The king of Paphos was fanned at his banquets by the wings of the goddess's doves. Passing to the antiques exhibited, the lecturer touched but slightly upon the sculpture. The glass he gave reason for deeming far older than was commonly thought. He cited the Egyptian wall-paintings in the tombs of Beni Hassan, which represented the whole process of glass-blowing down to its minutest details. These dated from

the reign of Osortasen I., of the Twelfth Dynasty, whose sway could not be brought down below the third millenium B.C. Mr. Hake dwelt mainly on the ceramic specimens. He said one of the first things to strike the student of ancient Cypriote pottery was the blending of Assyrian and Egyptian influences, and it was this quality which marked the Phœnician development of the art. The pattern showing rectilinear figures enclosing concentric rings was that evolved in metal working. The *guilloche* pattern was plainly developed from the process of plaiting. The arrangement of vertical bands instead of horizontal round the vase was characteristic. The usual explanation of the development of vase-painting was that it began with geometric patterns, grew into the representation of industrial processes, then passed to the figuring of plants and animals—this under Oriental influence—and lastly reached the human figure, at which stage it was perfected by Greek art. Now in looking at many of the Cypriote vases they were struck with the comparative perfection of the lines, and the imperfection of the figures, as if the potter had been unused to drawing the latter. Among the Cypriote vases those showing the highest development were few. The greater number, certainly the oldest examples, were Phœnician in type, the most characteristic features being lozenge and chequer patterns arranged in horizontal and vertical bands, sometimes mingled with animal forms, in which the habit of geometrical drawing was plainly discernible. In moving the vote of thanks, Sir P. C. Owen announced that what those present had seen was but a scantling of Mr. Hake's collection transferred to the Museum. A part of the treasures would be lent by the Department to Edinburgh, another to Dublin, while a third would shift from town to town.

THE CENTRAL HALL OF THE HOUSES OF PARLIAMENT.

IN the House of Commons a few evenings ago, Mr. Schreiber called attention to the unfinished state of the central hall of the Houses of Parliament, and argued that the three vacant panels ought now to be filled with mosaic pictures of the patron saints of Ireland, Scotland, and Wales. He remarked that he never yet heard anyone, either in the House or out of it, maintain that the decoration of the central hall, having been begun in mosaic, should be finished in anything else. What hindered the completion of this work was, as he understood, simply the want of an expression of an opinion on the part of the House in favour of decoration by mosaic. It was something more than ten years since this subject was last seriously debated by the House, and at that time there was a remarkable consensus of opinion on the part of all whose opinion was entitled to weight in favour of mosaics. In proof of this he quoted from speeches delivered in the course of that debate by such members as Mr. B. Osborne, Lord John Manners, Lord Elcho, Mr. A. Seymour, Mr. C. Temple, Mr. B. Hope, and Mr. Cavendish Bentinck, in commendation of the style of decoration he pleaded for. Objections were made to mosaic in connection with mural decorations. He admitted that they could not be seen in the central hall so long as the windows were glazed with painted glass; but that was a difficulty that could be overcome, while, as regards night, there remained the experiment of the electric light. Another objection was taken to the design of the mosaic picture of St. George. He quite understood that hon. members would have preferred the effigy with which they were familiar on Her Majesty's sovereigns, but the artist had to consider the company in which St. George was placed. He would be in company with an apostle and two bishops of the sixth century, who were not known to have shared his equestrian tastes, and so the artist set him on foot, and placed him between two female supporters, and wrote underneath, "St. George of England." But the three remaining saints had characteristics which, perhaps, would make them more easily recognised. He calculated that a sum of between 4,000*l.* and 5,000*l.* would finish the hall, which Barry always regarded as the principal feature of the building. He hoped the Welsh, Scottish, and Irish members would atone for their neglect in the past in reference to this matter by supporting the present proposal.

Mr. Cavendish Bentinck condemned the proposal on the ground that it was impossible in the present day to obtain satisfactory results in mosaic. Artists in mosaic in the present day did not distinguish themselves as their predecessors had done in the last century, or the century before. For this reason, among others, the dome of St. Paul's was standing unfinished. A year or two ago an attempt was made to establish a school of mosaic at South Kensington, but it was found impracticable to do so, and the attempt was abandoned. If the panels were to be filled up, in his opinion it should be done with paintings in oil. The hon. member would, he supposed, go to Venice for his mosaics. He was himself tolerably familiar with Venice, and he ventured to say that there was no artist in Venice at this moment who had the slightest pretensions to mosaic work, even of a third or fourth-rate order. The plan was not one calculated to encourage art in this country, and

he hoped such an expenditure of public money would not be sanctioned.

Mr. Shaw-Lefevre pointed out that this question was discussed in the House not only ten years ago, as the hon. member had said, but also two years ago, and on that recent occasion the hon. member failed to receive support from any quarter of the House. Even the Scotchmen, and Irishmen, and Welshmen to whom he had appealed did not think it necessary to say a word in favour of the motion. He could say no more than he said on that occasion. He fully sympathised with all the hon. member had said as to the beauty of the central hall, and he believed it would be desirable to complete it in a worthy manner. But, in the present state of opinion upon the subject, it would not be possible for him, with any chance of success, to make a proposal to the House in that direction. The mosaic which now filled one of the panels had been condemned by almost all the highest authorities on art. The late Mr. Adam, when First Commissioner of Works, had a committee appointed on this subject, which was composed of well-known artists, and they unanimously condemned the picture, and did not recommend that the remaining panels should be filled with mosaics, but strongly recommended the adoption of frescoes. Mr. Adam submitted a vote; but so hostile was the general feeling to any expenditure on frescoes that he was compelled to withdraw the vote. Since that time no action has been taken in the matter; and if he were to follow the advice of the hon. member for Poole, and propose an expenditure of 5,000*l.* for filling the three panels, he should also fail to carry the vote. Under these circumstances, he could not hold out any hope that this expenditure would be incurred. The hon. member was wrong in supposing that the work could be executed for the sum he had named, because, as had been pointed out, the School of Mosaic set up in South Kensington had already ceased to exist, and they should have to go to Venice or some other place abroad for artists to execute the work. Under all the circumstances, he could only repeat what he said two years ago—viz., that no good purpose would be served by entering into the question until he could obtain a general concurrence of opinion on the part of hon. members as to what ought to be done. He believed, indeed, that it would be wise to complete the decorations of the central hall at some future time. But it was undesirable to fill the three vacant panels with works of art which would not be worthy of them.

Sir A. H. Layard, in a letter to the *Times*, writes:—

"Mr. Schreiber again called the attention of the House of Commons to the unfinished state of the central hall of the Houses of Parliament. It appears, from the answer he received from the First Commissioner of Works, that nothing is to be done to complete it. As I may be considered responsible for the plan originally proposed for its decoration—although I was only carrying out the recommendation of a Royal Commission—I should feel obliged by your permitting me to make a few remarks on the subject.

"The great hall, whence access is obtained to the chambers of the two branches of the Legislature, may be considered the centre of the building. It should consequently be made one of its most important features. It had been my intention, when First Commissioner of Works, to complete its decoration by filling the arched recesses over the four entrances with pictures in mosaic representing the patron saints of the four parts of the United Kingdom, in pursuance of the suggestion of the Royal Commission to which I have referred. But I felt that it was necessary to make the rest of the hall harmonise with the richly-coloured mosaics, which would otherwise appear out of place, surrounded by walls and architectural details of stone painted putty-colour. I therefore proposed to ornament the ceiling with mosaic, to introduce a gold ground of mosaic in the niches behind the statues, to substitute columns of marble for those of painted stone, to remove the paint from the remaining stonework, to replace the painted windows by windows in *grisaille*, and to lower the chandelier so that a better light might be obtained. All this could then have been done, if I remember rightly, for about 8,000*l.* But several highly-gifted artists were ready to assist me, for a mere nominal remuneration, in preparing the cartoons for the mosaics. Mr. Poynter received only 100*l.* for what I must call his very fine design for the panel representing St. George.

"The work was stopped by the opposition of some members of Parliament. Unfortunately in England political animosities are allowed to interfere even in matters of art. Mr. Ayton, who succeeded to me as First Commissioner, felt no interest in completing what I had commenced, and had but little sympathy for art or artists. He ordered the picture of St. George to be put up without sufficient consideration—the ceiling had already been fortunately finished—and the hall was then left in its present discreditable state.

"The picture of St. George is said by some to be a failure. It has, no doubt, failed to a certain extent to produce the effect intended, principally on account of the band beneath the figures being too broad and raising them too much, and of the use of silver tesserae for the high lights. Mr. Poynter himself, I believe, fully recognises the fact. But the alterations required could and ought to have been easily made, if there had been any desire to make the work succeed. The decoration of the ceiling is admitted to be a success, and is generally admired.

"Mr. Shaw-Lefevre, replying to Mr. Schreiber, stated that some 'well-known artists' had condemned the mosaic picture, and recommended the adoption of fresco. It is not surprising, after the experience we have had of this material in the Houses of Parliament, that the proposal should have been summarily rejected. Mr. Cavendish Bentinck advises pictures in oil; but such a suggestion is unworthy of consideration. He denounced the mosaics of the Albert Memorial as a failure. But such is not the case. How, I would ask him, would a fresco, or an oil painting, have fared had it been similarly exposed to the weather? I maintain that the most suitable and durable material for external and internal decoration in the atmosphere and climate of London is mosaic.

"But then, says Mr. Cavendish Bentinck, we should have to go to Venice for workmen to execute mosaics, and 'artists in mosaic do not distinguish themselves as their predecessors had done in the last century and the century before.' He added (I quote from the *Times*' report of his speech), that 'he was himself tolerably familiar with Venice, and he ventured to say that there was no artist there who had the slightest pretensions to mosaic work, even of a third or fourth-rate order.' I certainly disagree with him. I believe that I have a far more intimate acquaintance than he has—having specially turned my attention to the subject—with the mosaics of Venice, ancient and modern. I do not hesitate to affirm that among the present workers in mosaic in that city are men of very considerable ability, quite capable of executing work of the highest quality, infinitely superior to that executed in St. Mark's and elsewhere in the last two centuries, and not inferior to that of the mosaicists of the best period of the art—the fifteenth and sixteenth centuries. I might mention, in proof of what I have stated, the great mosaic portraits of Marco Polo and Christopher Columbus, presented by the city of Venice to the city of Genoa, and the allegorical picture, in the same material, representing Venice giving the command of her Navy to the Doge Morosini, exhibited at the last exhibition at Milan, and now in that at Rome. It would be difficult to find finer specimens of the art as applied to decorative purposes.

"It is not worthy of Parliament or creditable to the nation that the central hall should be left in its present unfinished condition. I am still convinced that it can only be worthily completed by carrying out the original plan."

THE GOVAN SCHOOL ACCIDENT.

JUDGMENT has been given by Lord M'Laren in the action taken by a child against the Govan School, in which she claimed 500*l.* damages for injuries sustained in consequence of the fall of a play-shed. His lordship decided (1) That the plaintiff was injured by the fall of the shed; (2) That the defendants employed a competent architect and competent tradesmen in the erection of the school-house and play-shed, and that the play-shed having thereafter been taken down, the defendants employed a competent tradesman to re-erect the shed, under the supervision of the architect who designed it; (3) That the play-shed fell in consequence of faults in design, and in the execution of such design, resulting from the negligence of the architect and tradesmen employed. The School Board were declared to be responsible for the exercise of care and skill in the construction of the school-house and shed by the persons employed by them. The damages were assessed at 150*l.*, with costs.

A "note" was attached by Lord M'Laren to his interlocutor, wherein his lordship considered the law of the case. I shall not, he wrote, occupy space in commenting upon the evidence, because it is admitted that the building was of defective construction, but will proceed to consider the question of legal liability, which was argued with ability and anxiety. While in this instance the accident has been attended with little or no permanent injury to the pursuer, it is unfortunately the case that the fall of the shed caused the death of several of the children at school and the serious injury of others. The action is thus in some measure a trial case, and has been so treated by the parties. I have found that in the original construction of the shed in 1879, as well as in its re-erection in 1881, the defenders, the School Board of Govan, employed a competent architect and competent master-carpenters, but that the shed was faulty in design and execution, and that the injury complained of was the consequence of such faults. The re-erection in 1881 was very carelessly executed; and after hearing the evidence it is matter of surprise that the shed should have held together for nearly a year. But that it was originally faulty appears from the circumstance that, after the accident happened, it was found necessary to overhaul and strengthen the boys' play-shed, which was of precisely similar construction, and which had not been interfered with since its erection in 1879. It is, indeed, probable that if the architects' design had been executed with care and skill the shed would have held together, but I think the design was defective in this respect, that the rafters were not coupled together by tie-beams, and that the tie-beams connecting the pillars with the opposite wall were not securely attached at either extremity, so as to be capable of resisting the horizontal

thrust of the roof. These defects are spoken of by various witnesses, and, amongst others, by one of the defenders—a builder of large experience—of whom it is but fair to say that he did not see, and was not in duty called on to see, the working drawings of the shed when the general plans and specifications were submitted to and approved by the Board.

In the argument addressed to him, his lordship said, two defences to the action maintained—one of these being founded on the absence of personal negligence on the part of the corporate body, the School Board; the other being founded on the constitution of the School Board as a public body, exercising statutory powers, and entitled to a certain privilege or protection in virtue of its public character. In considering the questions thus raised, his lordship inquired, in the first place, whether the School Board as such has a personal privilege exempting it from pecuniary responsibility under this action; and, secondly, if there be no such privilege, and if the liability be the same as that of the shareholders of a proprietary school, whether the defenders are responsible for the consequences of the negligence of the architects and tradesmen employed in the construction of their building? His lordship continued: The question is, what is the measure of the defenders' responsibility? Is it that the defenders must use due care in the selection of an architect and artificers? or is it, in the language of Mr. Justice Hannen, that the defenders must show that due care was used in the construction of the building by those whom they employed to do the work, as well as by themselves? As to the existence of the rule of responsibility for the exercise of care and skill, and its justice and utility, there is a general agreement of opinion. It would, therefore, be a subject of regret if the law should, after affirming the principle of responsibility, suffer it to be evaded, as it would undoubtedly be, if directors or co-operators were allowed to devolve their responsibility upon architects and employés. Let it be understood that such persons are only required to appoint a competent architect and to employ competent tradesmen, and there is an end to all responsibility. But I know of no authority in our law requiring me to admit such a restriction of the rule of responsibility. If the defenders had employed journeymen carpenters and a competent foreman to put up the shed, and it had fallen in consequence of their bad workmanship, the defenders would have been responsible, according to the maxim *respondeat superior*. Instead of doing so, they employed a master carpenter with his assistants, and an architect, who says that he did not consider it his business to inspect the carpenter's work. I have never been able to understand why the circumstance of the employed person being sometimes an independent tradesman and sometimes a salaried servant should make a difference in the responsibility of the employer, assuming that the persons employed in the two cases are equally competent, and that the services they render are the same. The differences in position, skill, and mode of remuneration may indeed vary the responsibility of the architect or artificer to his employer, but can they vary the responsibility of the employer to third persons? Some railway companies make their own locomotives and carriages; other companies purchase theirs from manufacturers. The duty to the public is identical—to make provision in the highest attainable degree for the safe carriage of their passengers. In practice the responsibility of companies has been held to be the same, whether they are makers or purchasers of their rolling stock; that is, they are held responsible, unless where the imperfection is such as did not arise from want of care and skill on the part of the maker, and could not be discovered by the exercise of care and skill. The same view of the responsibility of companies has been taken in the cases of accidents arising from imperfections in fixed constructions, such as bridges and station accommodation. This was undoubtedly the view taken by Lord Wensleydale, a very high authority, in his judgment in the Court of Exchequer, which is cited in *Redhead and all the subsequent cases*, *Grote v. Chester and Holyhead Co.* The case of the race-stand was decided on similar principles (*Francis v. Cockrell*). I do not know that there is anything to the contrary in the judicial opinions delivered in *Campbell v. Kennedy*. This was a case of damage to property caused by the giving way of a water-pipe. The question was, not as to the original sufficiency of the pipe, but as to its condition at the time of the occurrence and the fact of negligence. The judgment of the Court found that damage was caused "by the negligence of the defender in allowing a certain pipe to be in a defective and insufficient state." This, of course, implies an obligation to use reasonable care in the maintenance of pipes and other fixtures from which damage may result to one's neighbours. The opinions of the judges are to this effect, qualifying the doctrine in *Cleghorn v. Taylor*, where Lord Wood had laid down, perhaps too absolutely, that "each proprietor is bound to keep his property in such a condition that it shall not be a cause of injury to his neighbour by its imperfect state." No doubt the care which a proprietor must exercise in keeping his property in proper repair is a very different thing from the care and skill which are to be exercised in its construction. A proprietor cannot be always looking after his property, and it is for a jury or the Court to say whether, in the particular case, he took reasonable care. In the case before me the cause of the accident was not disrepair, but original defective construction, the result of gross negli-

gence. While I think no personal blame is to be imputed to the School Board of Govan, I am of opinion that they are responsible civilly for the damage sustained by the pursuer.

DEEP-SEA LIGHTHOUSES.

At a meeting of the Society of Engineers, held on Monday evening, a paper was read by Mr. Chris Anderson on "The Feasibility and Construction of Deep-Sea Lighthouses." The extreme desirability and increasing necessity for lighthouses and telegraphic stations in mid-ocean is universally admitted. The following important objects to be attained by their construction may be briefly stated: (1) For meteorological purposes, as from a station say 1,000 miles from our shores, a storm-warning from the Atlantic could be sent thirty-six hours in advance, and a yearly saving of many million pounds' worth of maritime property and of hundreds of human lives thereby effected. (2) Shipowners could be apprised of the passage and condition of their vessels, and could forward messages to the same *en route*. (3) To afford rendezvous for vessels in distress or shipwrecked crews.

The author proposes to construct such lighthouses of hollow rivetted ironwork in the form of a large cylinder, about 36 feet in diameter, consisting of three essential parts. The upper portion, rising 140 feet out of water, is to be similar, so far as shape, arrangement, and internal fittings are concerned, to the tower of an ordinary lighthouse. The central portion, about water-line, will be packed with a material (such as cork-wood) much lighter than water, and capable of forming a durable and unsinkable floating power. The lower portion, extending to 150 feet below water-line, is intended to resist the force of wind and weather acting upon the tower, and as ballast to lower the centre of gravity of the whole structure to any desired extent. To this compartment water is admitted, and if necessary a quantity of iron ballast can also be employed. The lighthouse will be erected complete in the shipbuilding yard, launched, and towed out to its intended site, where it will readily be made to assume its erect position by admitting water to the lower compartment. Having been properly floated and ballasted, it will be securely attached by steel wire ropes, 2 inches diameter, to anchor blocks, weighing about 200 tons each, sunk in suitable positions, so that in water one mile deep each rope would be from two to three miles long. The proposed displacement is about 2,000 tons, for which there would be no difficulty in providing adequate moorings. The structure is entirely dependent for its floating power upon the light material contained in the central division, and is consequently unsinkable even if damaged by collision with a ship or iceberg. Owing to its peculiar form and arrangement, its stability is very great, so that if forced from the perpendicular it would instantly right itself with great power. The author has calculated that a hurricane moving with a velocity of 100 miles per hour, equivalent to a pressure of 50 lbs. per square foot, will only cause a deviation of 10 degrees from the perpendicular. Against this it is to be noticed that the sag of the mooring ropes will form a most effective spring to control any tendency to oscillation. As the whole mass of the structure is comparatively great, and the area exposed to the lifting force of waves very small indeed, the rising and falling motion caused by passing waves will be almost inappreciable. The author also proposes to employ similar lighthouses on a smaller scale for coast service. The immense saving of life and property which would result around the shores of the United Kingdom would be sufficient in one year alone to recoup their cost many times over.

LINCOLN'S INN CHAPEL.

THE Chapel of Lincoln's Inn will be opened on Sunday next after reconstruction. The removal of the ruinous old chambers in 1881, which had a common wall with the west end of the chapel, disclosed the necessity for rebuilding the whole of that front; and the opportunity was taken to lengthen the chapel from 67 feet inside to 91 feet, which is 5 feet more than the square part of the Temple Church; but this is all under one roof, like a college chapel, and only 40 feet wide, while the Temple is 59 feet, having aisles. The ante-chapel, in the form of a low transept, 57 feet long, has been added under the west window, containing a double staircase and vestries, which were much needed. Part of the ante-chapel is hidden as yet by old building, which will be removed in time, and the old hall of 1505 better displayed thereby. A new roof had been put on the chapel only ninety years ago with imitation vaulting made of plaster on string and nails, by Wyatt, the fashionable church-destroyer of that time, as several of the cathedrals testify. All the timbers which he built into the walls were more or less rotten from want of ventilation, and the roof might have fallen any day. So that also has been rebuilt, somewhat higher and with panels of Oregon pine unvarnished, on seventeen wooden arches or principals, not built into the walls, and with proper ventilation. The new pews are nearly copies of the old ones by Inigo Jones, but open. The shabby Communion-

table has been replaced by a very solid one made out of the few sound pieces of the old roof of St. Albans' Abbey, and these alterations were designed by the rebuilder of the west front of that cathedral, who is one of the benchers, and who designed the extension of the library by 50 feet, and the court under it, in 1872. Mr. Salter has been employed as architect. The organ has been partly remade, and a few stops added by Messrs. Hill, who built it twenty-eight years ago. The acoustic quality of the building for music has been very distinctly improved. The sixteen visible corbels of the roof carry shields with the arms of the four archbishops and ten bishops and two great deans, Donne and Cyril Jackson, who have been preachers in the 260 years since this chapel was built, nearly on the site of an older one of unknown date, probably the thirteenth century, when the inn belonged to Ralph Nevile and other Bishops of Chichester, before an Earl of Lincoln got it. It became an Inn of Court in 1310. Accordingly, the archlabel over the new entrance is supported by the heads of "R. Cicestr. 1225," and "Victoria R. 1882." The west and afterwards the east window are nearly filled with the arms of all the treasurers, the last of whom is the great judge who was buried with Jewish solemnities on Good Friday. At its consecration in 1623, when Donne preached, it is recorded that there was such a press of nobility and gentry that several of them died of it. The removed chambers will be more than replaced by the conversion into chambers of part of the old Chancery offices which reverted to the society, according to the Act under which they were built, on the removal of their business to the New Law Courts.

CHELMSFORD CHURCH.

AN address has been presented to Mr. F. Chancellor, architect, for rebuilding the porch of Chelmsford church at his own cost. The following is a description of the porch. The old inscription upon the clerestory of the nave, according to Morant, was to the effect that Chelmsford church was rebuilt in 1424, and no doubt the tower formed part of this rebuilding. The only other portions of the nave and aisles then rebuilt, and now remaining, are the west ends of the north and south aisles and the piers of the nave arcades. The porch was probably added after this rebuilding, and certainly by another architect, for upon comparing the porch with the parapet of the tower it will be observed that there is a similarity in the two works which suggest that they were designed by the same hand; they are, in fact, two fine specimens of that building in flint and stone which, although uncommon in this county, prevailed to a great extent in Norfolk. The main body of the tower is rugged and grand, but there is a refinement about the porch and the parapet of the tower which contrasts very forcibly with the tower itself. Some forty or fifty years ago the stonework of the porch, which appears to have been then in bad order, was repaired in Roman cement, and this in its turn was becoming very dilapidated, and suggested the necessity of a proper restoration in stone. Great care has been taken to restore all the ancient features of the building, and the mouldings have been faithfully reproduced. Fortunately a small portion, about 2 feet in length, of the panelled plinth complete was left, and this served as a key to the remainder, which had all been chopped off. The ancient staircase to the parvise was, no doubt, destroyed upon the rebuilding of the church at the commencement of this century. At one time access was obtained by an opening in the ceiling of the porch, a portion of the oak timbers and tracery having been cut out for this purpose; later on the west window of the porch was cut through and a brick excrescence built out to receive a wooden staircase. This has now been removed and the ancient window restored, and the access is obtained by a stone staircase at the north-west angle of the porch opening on to a corbelled gallery. The ceiling of the porch was partially plastered over and a large cove formed. Upon removing this plastering it was found that curved oak timbers were continued down to the plates and that the spaces were filled in with oak tracery. Some of these panels had become decayed, but most of them were sound and have been reused. The main timbers of the ceiling were decayed at the ends and must have given way before long; these have been restored with new oak timbers, the old mouldings being reproduced. The whole porch now forms a very beautiful feature of the church.

DENVER, COLORADO.

SOME letters on Denver, Colorado, are in course of publication in the *Times*. The city, which now has a population of 60,000, made its first beginnings as recently as 1858 as a freighters' and traders' stopping-point on the weary prairie waste, which stretched 640 miles from the Missouri, and reached west to Utah and California. During the last five years the progress of Denver has been greater and more continuous than at any former period. The town has extended and is spread over a wide area. New streets, all 60 feet wide, are being laid out; nowhere in the States,

not even in New York, are better roads, naturally firm and always dry, and more convenient, widely-extending footwalks. Real estate to the value of 3,000,000 dols. has changed hands during 1882—being nearly one-fifth more than in any former year. A diminishing amount is bought for speculative purposes. Large numbers of better class buildings have been erected; the numerous vacant lots on more important thoroughfares are being filled up. Building is said to progress at the rate of about 800 structures per annum. The reported cost of buildings erected during 1882 is 4,000,000 dols. Sites 25 feet by 125 feet, in the best thoroughfares, dragging at 200 dols. five years ago, during 1881 sold at 10,000 dols.; but, except in the best situations, the demand for and value of building lots is not so great as it was twelve months ago, and a few stores and a good many private dwellings are ticketed "for rent." The abundance of sandstone of three different characters and colours, of lava rock sold at about a dollar per ton, and of bricks costing 6 dols. to 7 dols. per 1,000, bring these permanent materials into more general use than in most new American towns. Owing to the high price of lumber—the rough home sorts worth 20 dols. to 22 dols., the better, imported, 45 dols. to 50 dols. per 1,000—frame buildings are almost as costly as the more enduring and more attractive brick house, which is hence generally preferred. Substantial brick and stone blocks, which are wont to pay 20 per cent. upon the value of the site and structure, owing to extending building and more moderate rents, now generally yield 10 to 12 per cent. For taxation buildings are assessed at about two-thirds their actual value, and are charged four mills per dollar. Mr. Tabor, who began life wielding a pick and shovel, and ran a store for some years at California Gulch, from advances in the value of property bought in Leadville, and from other judicious investments, has become a millionaire, spends his money freely in Denver improvements, and, besides other buildings, has erected a handsome, tastefully-decorated opera-house; other citizens quickly growing rich with advancing value of land for the development of mining enterprises, have also helped to extend and beautify Denver. Among new public buildings are a city hall, cathedral, various churches, twelve school-houses, affording accommodation for about 12,000 children, taught by an army of 110 teachers, boys and girls, young men and maidens, here, as elsewhere in America, being taught together without trouble or scandal. The older boys in summer go off to work, but frequently return for winter school work. With an unusually large floating population, Denver has ample choice of hotels. The principal, the Windsor, built at a cost of 75,000^l., accommodates about 400 guests, has 180 employes, and pays the English capitalists who erected it 12½ per cent. upon their venture. The English inhabitants of Denver, who are said to muster about 500, have a comfortable, convenient club-house. "The Queen City of the Plains" is well supplied with water from Lake Archer and the Platte. The company professes to control in every twenty-four hours some six million gallons of water. This is in the streets and houses. A steam heating company furnishes through mains and coils a hot blast available in the business part of the city; but, as elsewhere, this company has not yet proved financially successful. Electric lights are at the Union Depot and other public places, and for suburban lighting, four towers, about 100 feet high, two of iron and two of wood, bear aloft six lamps, each of 3,000 candle power, and visible in this clear atmosphere for upwards of twenty miles. This street and suburban lighting is to be extended. Telephones are laid throughout the city, and extend to Georgetown, Leadville, and Colorado Springs. Street cars, much patronised in hot weather, run through many thoroughfares, and to diminish tear and wear to the track, and the damage to wheeled vehicles grinding on and off it, the managers have wisely laid it on a 3½-foot gauge.

Awards to Boyle's System of Ventilation.

SIR,—In your issue of last week, you state in your description of our exhibits at the building exhibition that our system of ventilation was awarded two gold medals last year, one of them, and the one on which we no doubt placed the greatest value, being gained at the Shipwrights' Exhibition.

We beg leave to correct you as to this award, as it was not a gold medal but a prize of 50^l., offered for the best system of ventilation, that we were in this instance fortunate enough to secure. The competition was international, and there was only the one prize offered. Our system was awarded the gold medal at the Exhibition of Means and Appliances for the Preservation and Saving of Human Life, held in London last year, and also gained the first prize (silver medal) at the Naval Exhibition, Tynemouth, in September. These are the only exhibitions at which we exhibited last year where prizes were offered.

Yours truly,
ROBERT BOYLE & SONS.

64, Holborn Viaduct, E.C., April 3, 1883.

REVIEWS.

ILLUSTRATED ART HANDBOOKS. Sampson Low & Co.

The additions to Mr. Cundall's series of handbooks are popular in treatment without being superficial. Mr. George Redford's Manual of Sculpture is well adapted for students' use and general perusal. The author's knowledge as a surgeon enables him to give descriptions of the statues, which are precise without being pedantic. The volume is full of engravings, and diagrams of normal proportions according to ancient and modern systems are introduced. It is one of the most comprehensive in the series.

The volume by Professor Smith and Mr. Slater on Classic and Early Christian Architecture, although later in publication, fills up a period prior to that treated of in the same authors' volume on Gothic and Renaissance architecture. The subject is explained in masterly style, and the volume, which is full of illustrations, may be employed as an introduction to larger and more elaborate works.

The third volume, which is on English and American Painters, is biographical and critical. Mr. Buxton follows the course of English art from an early period to our own time. Mr. Kochler supplies the chapter on American art. There is much which is interesting in it, especially the part relating to Allston, a painter who was much admired by Emerson and his school. It is evident from his aphorisms (which might have been printed in the volume) that he had an exalted notion of art, but, as often happens with painters who are attracted by theoretical speculation, his pictures are disappointing, and, in more ways than one, they resemble Haydon's.

PUMPS AND PUMPING MACHINERY. By Frederick Colyer, M.I.C.E., M.I.M.E. London: E. & F. N. Spon.

This book is a companion to the author's work on Hydraulic and Steam-Lifting Machinery, and it corresponds with that in being of a thoroughly practical character. Mr. Colyer is largely engaged in the arrangement of breweries where machinery of the kind is employed, and he gives his readers the benefit of his experience. He describes lift-pumps, force-pumps, centrifugal-pumps, air-pumps, engines, boilers, and boiler-houses. Mr. Colyer does not laud himself or his work, and the examples he gives have been all constructed by well-known firms. Various kinds of pumps are described, and their advantages and shortcomings are candidly and impartially set forth. There are twenty-three clearly engraved plates of engines, which are so many working drawings. Suggestions are given for foundations and fixing, and there is a chapter on engine and boiler-houses. Mr. Colyer's volume deserves to be accepted as a standard work on the subject, which is one about which information would with difficulty be obtained from any other source.

CHURCH BUILDING AND RESTORATION.

Stoke.—The parish church of Stoke Damerel, Devon, has been reopened, after internal renovation and improvement. The work has been carried out by Messrs. J. Martin & Son, builders, Devonport, from the plans of Mr. J. P. St. Aubyn, architect, Temple, London.

Scarborough.—The foundation-stone of a new church in St. Mary's parish has been laid. The site of the building is at the corner of Globe Street and St. Sepulchre Street. Mr. C. H. Fowler, of Durham, is the architect.

Broughton.—The memorial-stone of a school-chapel in course of erection in Great Clowes Street, Broughton, has been laid. The building will be Early English in style, and it is estimated that the entire cost will be about 1,800*l*. Mr. George Baines, Accrington, is the architect; and Mr. George Parkinson, Ancoats, the contractor.

Newton.—The chapel of the Newton Union Workhouse, Devon, has been reopened after the carrying out of internal alterations, including reseating the building, which have been executed under the direction of Messrs. Rowell & Son, architects, Newton Abbot. The work has been done by Mr. H. Mills, of the same town.

SCHOOL BUILDINGS.

Blyth.—New Wesleyan Sunday School buildings have been opened. The works have been executed from the designs of Mr. F. R. N. Haswell, F.R.I.B.A., of North Shields, by local men—Messrs. J. & W. Simpson for masons', bricklayers', plasterers', carpenters', and joiners' work; Messrs. Kirk & Brown, slaters'; Mr. J. Grantham, for plumbers' and smiths'; and Mr. Thomas Walker for painters' and glaziers'. The new schools and vestries are erected immediately to the north of the chapel, and communicates therewith internally. The porch on the east side gives access to both old and new premises. Special consideration was required regarding the foundations, owing to the fact that the site of the new buildings is part of the Slake, and was covered every tide prior to the commencement of the present proceedings. The

architect (Mr. Haswell) advised that it would be best and most economical to carry down cement concrete pillars to the rock, and span the intervals with rolled iron girders to carry the walls, &c., of the superstructure. This method of construction permits the tidal water to pass through the ground without endangering the stability of the buildings. The new buildings consist of a school-room 55 feet long by 26 feet wide and 24 feet high, having six class-rooms 18 feet by 10 feet 6 inches each, arranged on both sides of it. Adjoining the school-room is a large vestry 22 feet by 15 feet, and this is fitted up with a special arrangement of boilers, oven, &c.

Leicester.—The memorial stones of a new hall for the Sunday School Union have been laid. The architect of the building is Mr. Tait, of Friar Lane, Leicester; and the contractors are Messrs. J. Holmes, H. T. & W. Chambers, and Norman and Underwood.

NEW BUILDINGS.

Honiton.—There being a great demand for houses in this locality, a company has been formed with a view of erecting villas of a suitable character to meet the requirements of persons wishing to settle in the neighbourhood. The company has purchased land that commands fine views of the neighbourhood, a short distance from the town on the Axminster Road, in a healthy locality, where the drainage and water supply will be everything that can be desired. It is proposed to erect a series of first-class semi-detached villas, each of which will have good front and back gardens. The contract for the first block to be erected has been taken by Messrs. Berry & Otton, builders, of Honiton, from plans prepared by Mr. Alfred H. Wills, architect and surveyor, of the City Chambers, Exeter, and the houses will be provided and fitted with every modern improvement in sanitary arrangements and other details.

GENERAL.

Mr. Frank Holl has been elected Royal Academician.

M. Bonnat will exhibit at the Salon this year a portrait of Mr. Morton, the United States Minister at Paris.

Messrs. Dennett & Ingle have been instructed to restore the fireproof flooring in the Home and Colonial Offices, which sustained lately the explosive force of dynamite, and thus contributed to the safety of the building.

Mr. Mundella has stated that there is no likelihood of the Government purchasing the Alexandra Park in order to convert it into a public park.

Mr. T. Mellard Reade, F.R.I.B.A., on Monday evening read a paper at the meeting of the Liverpool Geological Association, on "The Drift Deposits of the Cromer."

The Royal Baths in the city of Bath were on Tuesday reopened after improvements. The old Roman bath was inspected by the Corporation as well as the new baths, constructed at a cost of 14,000*l*.

A Project is on foot for the restoration of Nevil's Cross, near Durham, which marks the site of the battle between the Scots and English in 1346.

A Collection of Casts from the antique is to be provided for the Manchester Grammar School.

Mr. C. Bryan Oliver, of London and Bath, has obtained first place in the competition for the Calne Town Hall. The Town Council adopted the report of the professional referee, and unanimously accepted Mr. Oliver's design.

Messrs. Charles Williams & Co. supplied the constructional ironwork for Nicholas House, E.C., a building illustrated in last week's *Architect*.

The Whitechapel Fine Art Exhibition was closed on Saturday. During the twelve days it was open there were 34,644 visitors, and 10,000 copies of the penny catalogue were sold.

The Firm of Cross & Wells, architects, of Hastings and London, has been dissolved, in consequence of the death of Mr. A. Cross. Mr. Arthur Wells has now offices at 27 Chancery Lane, London, and 25 Havelock Road, Hastings. Mr. A. W. Cross has opened an office at Manorial Buildings, Hastings, with a branch at 70 Chancery Lane.

Mr. Walter Hanstock, A.R.I.B.A., of Batley, was awarded the first premium in a competition for Wesleyan Sunday Schools at Morley, near Leeds. The building will have an assembly-room to seat 1,000 children, infants' school for 325, and more than twenty class-rooms. Thirty-one architects competed, from all parts of the country, and forty-three sets of plans were sent in.

The Liverpool City Council on Wednesday decided to commission Mr. Stirling Lee to execute one of the bas-reliefs at St. George's Hall, on the following terms—viz., 500*l*. to be paid to him in case he is not engaged to execute the remainder of the reliefs, and 450*l*. if he is so engaged, the work to be executed in Istrian marble.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, APRIL 7, 1883.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

COMPETITIONS OPEN.

ELGIN.—May 31.—Plans and Designs are wanted for Town Hall proposed to be erected. Mr. David Forsyth, Town Clerk, Elgin.

MOLD.—May 8.—Plans and Specifications are required for adapting Upper Rooms of Market Hall as Assembly Rooms. Mr. G. E. Trevor Roper, Clerk to the Local Board, Mold.

SPITALFIELDS.—April 7.—Designs, &c., for Iron Roof for Market are required. Mr. R. Rayner, Elder Street, Norton Folgate, E.

CONTRACTS OPEN.

AVR.—April 30.—For Building Station Buildings and Hotel. Plans, &c., at the Engineer's Office, St. Enoch's Station, Glasgow.

BACUP.—April 9.—For Alterations to Bull's Head Inn. Mr. S. T. Williams, Architect, Irwell Terrace, Bacup.

BEAUFORTH.—April 21.—For Building Schoolmaster's Residence at Patchcott. Rev. Dr. Willis, Rectory, Beauforth, Exbourne, Devon.

BITTERNE.—April 10.—For Construction and Maintenance of Scaffold to Spire of St. Saviour's Church. Mr. W. H. Mitchell, Architect, Portland Street, Southampton.

BIRKENHEAD.—April 16.—For Building Town Hall, Hamilton Square. Messrs. Ellison & Son, Architects, 62 Dale Street, Liverpool.

BRENTWOOD.—April 17.—For Construction of Sewage Tanks, Engine House, Cottage, and Subsoil Drainage of Land. Mr. Shelley, Junction Road, Brentwood.

CASTLETON.—April 11.—For Extensions to Westbrooke Mills. Messrs. Sellers & Hamilton, Architects, Union Chambers, Bury.

CANTERBURY.—April 18.—For Erection of a Warehouse. Mr. John Green Hall, Architect, 8 St. Margaret's Street, Canterbury.

CLECKHEATON.—April 13.—For the various Works in the Erection of the Whitelife Leather Works (part Fireproof), for Messrs. Rowland Walker & Son. Mr. Reuben Castle, Architect, Westgate, Cleckheaton.

COPFORD.—April 19.—For Repairs and Additions to Parish Church. Rev. B. Ruck Keene, Rectory, Copford, near Colchester.

COVENTRY.—April 11.—For Building Warehouses, Smith's Shop, &c., West Orchard. Mr. Herbert W. Chatta way, Architect, Trinity Churchyard, Coventry.

COVENTRY.—April 14.—For Forming People's Park. Mr. E. J. Purnell, City Surveyor, Coventry.

EASINGWOLD.—For Building Vicarage House. Mr. Ewan Christian, Architect, 8A Whitehall Place, S.W.

ECCLES.—April 12.—For Building Shed at the Union Infirmary. Mr. L. Booth, Architect, 88 King Street Manchester.

EXETER.—April 16.—For Erection of Post Office. Mr. A. B. Mitford, Office of Works, 12 Whitehall Place, S.W.

GRAYS.—April 12.—For Building Grocery, Butcher's and Draper's Shops, Bakery, Stables, &c. Mr. J. F. Goodey, Architect, Portland Road, Colchester.

GUERNSEY.—April 12.—For Construction of Gasholder Tank. Mr. T. C. Crossley, Gas Works, Guernsey.

HALIFAX.—April 13.—For Building Two Dwelling-houses and Shops in Silver Street. Messrs. Jackson & Fox, 22 George Street, Halifax.

HEDNESFORD.—April 18.—For Building Wesleyan School and Class-rooms. Mr. W. Stanford, Church Hill, Hednesford.

HILLSBOROUGH.—April 7.—For Building Board Schools. Messrs. Wilson & Masters, Architects, Hartshead Chambers, Sheffield.

HUNSLLET.—April 10.—For Works of Eight Houses, Brick and Mason Work excepted. Mr. J. E. Leak, Architect, Leak's Terrace, Hunsllet.

JEDBURGH.—April 18.—For Building Board School, Teacher's House, Boundary Walls, &c. Messrs. Hardy & Wight, Architects, Edinburgh.

LANCASTER.—April 9.—For Building Residence in Meeting House Lane. Mr. Joseph Parkinson, Architect, Market Street, Lancaster.

LINCOLN.—April 12.—For Enlargement of Post Office. The Postmaster, Lincoln.

GLAZED BRICKS,

Both White and Coloured,
which they can offer at very Low Prices.

The Architect.

BUILDING RESPONSIBILITIES: THE GOVAN CASE.

REPORTS have appeared in *The Architect* during the last few weeks of somewhat painful proceedings in the Scotch law courts with reference to the fall of a play-shed at the Board school of Govan, near Glasgow, whereby several of the children were seriously injured, and some, indeed, fatally. Last week we gave in full an elaborate judgment delivered by Lord McLAREN; and it will thus be seen that the judge, in awarding damages against the School Board as the owners of the building which fell, attributes the real fault to the builder whose workmen erected it, and the architect who, his lordship thinks, is to be regarded as having designed and supervised it. We cannot, of course, pretend to review this judgment, or even to put any construction of our own upon the evidence; but it is plain that the case is one of great importance both to builders and to architects, and this the more especially, perhaps, in view of the circumstance that Edinburgh lawyers, notwithstanding their use of phraseology which is occasionally (not to put too fine a point upon it) a trifle "stern and wild," are thought to go to the root of a plain matter in a straighter line, sometimes, than is taken in London.

At the Govan school, it appears, there were erected in the year 1879 two play-sheds about 70 feet long and $13\frac{1}{2}$ feet wide, having in each instance a wall along the back, and a range of cast-iron columns $11\frac{1}{2}$ feet apart along the front. The roofs were formed of coupled rafters, without principal trusses, resting upon a wall-plate at the back, and upon a bressummer over the columns in front, the wall-plate and bressummer being kept in position by tie-beams, one over each column, and consequently $11\frac{1}{2}$ feet apart. One of these sheds some two years afterwards, namely in 1881, being to all appearance quite substantial, was taken down and re-erected in another position without any alteration whatever. It stood about a year, and then fell, as we have said, a few months ago, with the unfortunate consequences described. The cause of its fall is agreed to have been the very simplest of all causes in such a case, and the most easily understood—namely, the defective tie of the roof. It is scarcely necessary to explain, even to the least architectural of our readers in England, that if the wall-plate which carried the feet of the back rafters and the bressummer which carried the feet of the front rafters were both continuous and sufficient in themselves, as they seem to be acknowledged to have been, all that was wanted to keep the roof from spreading was to connect them by means of any sort of ties, either timbers or iron rods, provided these were in the first place sufficiently strong for the strain, and in the second properly attached to the wall-plate and the bressummer. The actual defect in the ties seems to have been in this attachment at the ends; they ought to have been carefully and strongly fixed, and it is considered to be proved that they were carelessly and weakly fixed.

Now if damage is done by the fall of such a structure as this, it is plain enough, we may suppose, that somebody must pay for it. The "accident" cannot be called, as the legal phrase goes, "the act of God." It was maintained to be "the act of God," for instance, the other day, when a strong wind blew a London chimney-shaft bodily across intervening property and dropped it into the counting-house of a quiet citizen two doors off; but not even the wind was in request at Govan—the roof-ties simply gave way, and the roof came simply to the ground. Now it may be said that the tie of a common span-roof for a shed $13\frac{1}{2}$ feet wide is far too easy a matter in these days to be involved in indefinite hazard of any kind whatever. Some of us might almost say the skill of an architect, the direction of a builder, even the supervision of a foreman, would be wasted upon it, for that no carpenter with a head on his shoulders could possibly do it wrong. At the same time there is, as we understand, a curious circumstance to be kept in view turning upon this. One of the

passing remarks of the judge was "that the design was defective in this respect, that the rafters were not coupled together by tie-beams." This refers to the common practice in Scotland (where trussed principals are not much used) of forming a roof of a continuous series of self-tied "couples," each composed of two rafters and a tie, the tie becoming frequently the floor-joist of an attic room. It may be readily supposed in such circumstances that many common carpenters would be possessed by the idea that a departure from this plan becomes a special manifestation of science a little beyond the limits of their responsibility. This supposition would at any rate help us in our endeavour to comprehend the otherwise very strange fact that the ties of the Govan shed, which an English carpenter would see in a moment to be intended to keep the wall-plate and bressummer in position by withstanding the whole spreading force of the rafters, were to all appearance put in by the Scotch workmen as if for some unknown object which involved no strain in particular. They were apparently laid almost anyhow on the wall-plate and bressummer, with a bearing of little more than two inches, and then carelessly nailed down with "nails of inferior quality and too few in number." The universal English practice in the country, even in a farm stable or a barn, is first to keep the wall-plates right by means of specific tie-beams carefully secured to them for that specific purpose, and then to leave the rafters to expend their spreading force upon the wall-plates thus immovably fixed. Not even a hedge-carpenter in England, therefore, would misunderstand the ties of the Govan shed, as the Scotch workmen seem to have misunderstood them because of the circumstance, as Lord McLAREN puts it, that "the rafters were not coupled together" by them. If we are right in this argument, it serves, we repeat, the purpose of enabling us to see a little way into a state of mind on the part of the workmen which otherwise is scarcely credible.

Supposing this theory, then, to be correct, what is to be said of, first, the master-builder, and, secondly, the architect? In the trial which has taken place before Lord McLAREN, it must be remembered neither of these deeply-interested parties was at liberty to be personally defended. Both were voluntary witnesses, but nothing more. Although it is earnestly to be hoped that legal proceedings will not be allowed to go further, it is only by other suits that they can ever justify themselves in any formal way. We would crave the indulgence of the public, therefore, for both alike. Surely neither of them could be so inexperienced as not to know the weakness of this roof as it is described to us, or so thoughtless as to have neglected the danger. An accidental oversight of some kind is much more credible: and how easily such an act of negative neglect may happen to come about in building business none but those who are engaged in building business can pretend to know. It is one of the grievances, indeed, of the building world that what the lawyers call "constructive negligence" can be so easily established to the satisfaction of a judge on the bench or a jury in the box, and must always be so difficult of that direct disproof which too often is the only alternative. The maxim of law that an accused person is to be held absolutely innocent until he is legally and fully proved to be guilty, however well it may hold good in the case of a pick-pocket, whose operations everybody can understand, seems very much to fail in its application to a question of bricks and mortar, which, as a rule, nobody ever very clearly understands who happens to have the privilege of adjudicating upon it on behalf of the public.

Information reaches us that the architect, who in this case has to bear the brunt of the judicial censure, and who is a respected Fellow of the Institute practising in Glasgow, has had his design for the unfortunate roof in 1879 investigated and approved by several of his professional brethren, and by two civil engineers as well, and that his working drawings of that date show most careful attention to the details of construction. The other shed, similar in construction, which was built at the same time (1879), seems to have stood pretty well, although no doubt the failure of its fellow has now led to the precaution of its being strengthened. The fallen shed itself does not appear to have been thought unsubstantial in any way when it was ordered by the School Board to be removed to another site; and it is not very clear that the orders for removal were given by the Board through the architect in such a way as to awaken any sense of responsibility in his mind. A mason was employed to do the walling, and we are told that the firm of carpenters who were instructed

to do the woodwork thought so lightly of it, that they communicated to the architect on a Friday the fact of their having then commenced the re-erection, with the intention of completing it on Monday morning. When, therefore, he was able to visit the place a few days afterwards, he is said to have found the shed to all appearance exactly as it had been before, with nothing to provoke on his part a scrutinising examination, especially of that hidden work which he might surely be excused for supposing no workman could have done wrong. Accidents, however, will happen in everything; and in building especially it has often to be acknowledged that "nothing is so sure to occur as the unforeseen." We earnestly hope that, if the Govan School Board should unfortunately feel obliged to carry the present case further, it may be at any rate submitted, not to the fallacious and painful tests of legal process, but to such investigation as the practised intelligence and special skill of some trustworthy professional authority can alone conduct. Scotchmen are proverbially cautious and considerate, and in all cases of this kind the greater the caution and the more considerate the feeling, the more likely is the result to prove permanently satisfactory. At the same time we advise the architects and builders of Glasgow, and of Scotland at large, to lay to heart this unhappy case in a way which they will readily understand.

THE BUILDING EXHIBITION AT THE AGRICULTURAL HALL.

(Continued from page 229.)

DURING the past week the exhibition at Islington has attracted a great many architects and builders, as well as people who take an interest in building. It is, however, the universal belief that if the exhibition could have been kept open for a longer period it would be infinitely more profitable to the firms who are represented in it. But the arrangements of the Company necessitate the withdrawal of the building exhibits, some of which are described in the following pages.

A firm who must not be lightly passed by is the Albion Concrete Company, of which Mr. CHARLES LUMLEY is manager, and whose works are at Heymerle Road, Glengall Road, S.E. This exhibit is situated in the arcade, Bay 62, and consists of various specimens of string courses, cornices, heads, and sills for windows, caps, columns, bases, &c.; also several chimney-pieces in red concrete. This is their first appearance at the hall, but we should undoubtedly say it will not be their last, for they cannot fail to secure orders from such samples as are shown. In every case the arris is exceptionally sharp, and the section of the mouldings wonderfully perfect, more so than any we have seen; in fact, we believe they are the nearest approach to natural stone yet in the market. In ornamental work, as introduced into best mantel-pieces, and other things, particularly undercut work, every line comes out to the model, and has the appearance of having just been left by the chisel. We understand the firm possess many improvements in moulding, to which the superior finish referred to is to be attributed, and they are supplying the material in various tints of red and buff.

The Silicate Paint Company, Cannon Street, occupy Stands B 60 and C 87, and this year, in addition to the specimens of their well-known pigments in the various stages of manufacture, have a novelty in the shape of a drawing-room decorated entirely in "Duresco" and Charlton colours. The walls and ceiling are coated with admirable washable distemper, but beyond a little decoration in lieu of a cornice there is quite an absence of colour. This is rather surprising, for the salient features of the white groundwork would have been none the less apparent for a little panel and dado decoration, and would have been more in keeping with a drawing-room, for we are not aware that bare white walls are amongst the requirements even of ultra-æstheticism. It is almost needless to remind our readers that the paints manufactured by this Company are innocuous, and noted for their exceptional covering powers; some samples of woodwork being shown that have received two coats of silicate paint over ordinary oil paint have beautiful surfaces.

Another firm who make their appearance for the first time this year is Messrs. PILKINGTON & Co., 15 Fish Street Hill, occupying Stand F 196. They are contractors for various kinds of asphalt,

notably two, respectively known as "Polonceau" and "Seyssell," and many samples are shown illustrative of their special uses. These comprise a section of flooring as generally laid down in buildings, a section grooved for stable flooring, sections with the surface imbedded with fragments of silicated flint, small gravel-stones, &c., having a very pretty effect for garden-paths, tennis courts, &c. A section of 3-inch work for basement floors where there is a tendency for water to force its way up—this quality thoroughly keeping it out—consists of 2-inch concrete, formed of asphalt and stone, with a 1-inch layer of pure Polonceau over it. A great speciality with this firm is their particular adaptation of asphalt for roofing purposes, it being their exclusive patent. It has been used in a great number of public buildings, including the several blocks of St. Thomas's Hospital, and in every instance has given entire satisfaction.

Messrs. CHAMBERS, MONNERY & Co., 41 Bishopsgate Street Without, E.C., are showing at Bay 55, Arcade, probably the most varied assortment of builders' ironmongery in the exhibition, amongst which are one or two specialities well worthy of attention. They are old makers of wall ties; and here are to be seen a great variety in black and galvanised, wrought and cast iron. Axle and frame pulleys, locks, latches, &c., are well assorted, some of them appearing to be of first-rate value. Suites of polished brass and bronzed furniture, in Queen Anne and other styles, for front and inside doors, &c., are very elegantly designed and the finish of the first order, as well as a number of new pattern mediæval hat and coat hooks. The collection of casement and sash-fasteners is very large, and among the latter are samples of Bonwick's patent sash-fastener, which undoubtedly deserves a prominent place amongst the many *secure* sash-fasteners now in the market. It is strong, safe, and effective, looking and possessing the following among other advantages, viz., the arm cannot be sawn through or bent, being extra strong and protected from the file by a revolving internal iron roller; it is locked by one motion identical with that of the ordinary fastener, and holds the sashes together very tightly; and, what is of more importance still, is its freedom from springs or other complications likely to get out of order. Another speciality is their improved cottage range or kitchenette, as they term it. This is really a Leamington in miniature, and is very strong and of smart appearance, is self-acting and self-setting, with wrought bars and brick back, and is alike worth the attention of the architect, the builder, and the householder. Ranges of various prices, baths, and garden-gates, railing and other heavy castings, complete the exhibit.

The value of papier-mâché and carton-pierre as decorative substances is amply illustrated by the Papier-Mâché Company, 21 Wellington Street, Strand, who take a leading position with their artificial substances. To prove the adaptability of the materials to ornamental purposes, a life-size figure of HEBE is shown, one of a series of similar productions recently manufactured by the Company for some buildings at the Cape. The figure is in every feature equal in sharpness and artistic delineation with a plaster cast, and it has the important characteristic of being about one-fourth lighter in weight than its plaster prototype—an advantage that will be appreciated under most circumstances—and, in addition, the material is not so brittle or likely to chip. The question of weight appeals equally prominently to us when carton-pierre or papier-mâché is applied to ceiling decoration, and, as it will compare favourably in price with ordinary plaster-work, it should commend itself to architects in preference to the more commonplace material. The Company exhibit some excellent designs in dado decorations, the colouring of which can of course be arranged in harmony with the surroundings of the apartment for which they are intended; and in a ceiling decoration, shown about one-half size, we have an illustration of the designs capable of being introduced. Picture frames is another form to which these materials are applicable, and for these the Company contend they are in a position to supply their productions at a lower price than the "compo" article now in general use. Indeed, the examples shown would appear to leave no doubt on the mind of the observer, and, when brought into requisition for overdoors, the cost of the fibrous material is in some instances ridiculously low. So far as designs are concerned, that is a matter merely of first cost. The architect has merely to provide his drawings, and moulds can be made for their reproduction in the material; and, if replicas are required, the cost is lowered in a corresponding ratio; but, if the

original design is not to be again utilised, then the cost of its production must necessarily remain a charge upon the work. It will be readily seen that there is scarcely a limit to which these substances may not be utilised, and, as weight should always be considered as an important factor, particularly in overhead decorations, carton-pierre and papier-mâché should not be long in supplanting plaster of Paris for such purposes.

Messrs. JOHN WARNER & SONS, of the Crescent Foundry, Cripplegate, E.C., have this year secured a position in the body of the hall, and if their display is not so extensive as that of some of their competitors, what they do exhibit is, as regards workmanship and material, calculated to maintain the reputation of this old-established firm. The articles shown consist of iron and copper japanned baths, lavatories, washhand basins, &c., a variety of closets, in which those of the spring-valve class and their villa valve closet are notable; these are fitted with supply-valve and regulators. Their well-known pan closets are also exhibited, and are shown with both iron and earthenware containers. To pumps Messrs. WARNER & SONS have always paid especial attention, as well as to hydraulic machinery on a large scale; but on the present occasion they content themselves with a display of iron and brass lift and force pumps and deep-well pumps and frames, the usual accompaniment of plumbers' fittings helping to supplement the collection. We expect to hear a good-toned bell when we come in contact with any from the Crescent Foundry, bell-founding, we may remind our readers, being the Messrs. WARNER's original industry; and they have sent a few here suitable for schools, &c., that will not disappoint those who may purchase them. These complete the exhibit, which, so far as we could observe, contained no new feature.

Of later years it has become the rule to seek professional advice in furnishing a residence, and as the designs of the electric light, gas, or bell-fittings and lock furniture have to be taken into consideration in the construction of all modern villas of any pretensions whatever, it is obvious that art metal-workers in brass as well as in wrought iron should be represented. Messrs. JONES & WILLIS, 43 Great Russell Street, and 260 Euston Road, and also of Colmore Row, Birmingham, make by far the best exhibit in this industry. As ecclesiastical and general art metal-workers they are too well known, and for excellence of design and workmanship have too long a reputation to require comment from us upon that head; our remarks must therefore of necessity be confined to mentioning some of the articles on view at the stand. In the centre is a beautifully-designed and richly-wrought sanctuary gas standard, which was first exhibited at the late Paris Exhibition and was awarded a silver medal. Near to this are others of a more ordinary character; also an eagle lectern. From the ceiling are suspended coronas in various styles, some being fitted with their patent Hesperus mineral oil lamps. The greater part of the stand is enclosed with various specimens of wrought-iron garden railings and entrance gates, and amongst the latter is one of a very massive and ornate description; but some simple yet very effective ones are shown, with railing to match, at a price little exceeding good cast-iron ones. Some elegant and inexpensive brackets, and other fittings in brass, iron, and iron and brass for electric lighting, two or three dog-grates, and an assortment of the Hesperus lamps for table and other purposes, complete this artistic and interesting collection.

Messrs. T. WILSON & Co., Stowmarket, Suffolk, show at Stand B 69, samples of their alkaline composition for removing paints, varnishes, &c., and which possesses many important properties; amongst which may be mentioned its containing the caustic properties of the powerful alkalis without their evils. Another advantage is that it acts equally as well where merely washing or cleansing of paint is required as it does in removing several coats of time-hardened paint. It can also be used with advantage for removing wall-papers or dissolving old distempers on walls or ceilings, and a preparation of it is put up specially for household purposes, and is claimed to be much superior to soap for cleansing picture-frames, cornices, and numerous other things, including culinary and dairy utensils.

The patent diachromatised wood-blocks or slabs of Messrs. H. C. WEBB & Co. have been so fully described on former occasions in the columns of *The Architect*, that little room is left to say anything additional in their favour. That some improvements have taken place in the mode of manufacture since their first appearance is only what we naturally expect to

see carried out in any new idea, and we may presume that the Messrs. WEBB have reached the pinnacle of success so far as the completion of their arrangements are concerned for the manufacture of these ingeniously-decorative substances; but, on the present occasion, we are introduced to Mr. WEBB's most recent invention, the decoration of woods plankwise, the diachromatised tiles it will be remembered being treated grainwise, or as the wood grows. The new decorations are intended for all kinds of panelling, dados, furniture inlays, &c.; and although from the opposite mode of treatment to that of the diachromatised blocks, the patterns cannot be imbedded so deeply into the planks, they penetrate the woods sufficiently to render them practically unalterable and imperishable. There are several choice examples of this mode of "wood printing" shown, and for various purposes, the patterns covering a wide range, from the most delicate lines in a floral design to figures in Early English costume in various colours. This mode of decoration will no doubt be extensively patronised, as to a certain extent it effects what has as yet been impossible to produce on wood, and the moderate price at which the ornamentation can be provided will place it within the reach of a class that cannot indulge in the luxury of marqueterie, or, generally speaking, of inlaid woods for their decorations. As a companion exhibit, WEBB's Worcester Tileries Company, Limited, occupy the adjoining space with a choice collection of their encaustic, mosaic and geometrical tiles, adapted for all purposes of decoration, including furniture inlays. The patterns embrace a wide range, and are equal in design and finish to anything in the hall. A collection of new printed, underglazed tiles for hearths are worthy of attention.

The Patent Victoria Stone Company, Kingsland Road, E., make a meritorious display of their speciality, which is so generally known as to require no further detailed description than it has received at our hands on former occasions. Samples of the paving as laid down on many London footways and a railway platform coping are amongst the exhibits, the ornamental features including a staircase, a large window head, and a mullion and sill, and a small door-head and window-head, while the more decorative items are illustrated by a pair of vases and pines. Domestic articles in the form of sinks, &c., are amongst the collection, and we may add there is scarcely anything required for building, decorative, or domestic purposes, where a hard stony substance is necessary, that may not be satisfactorily manufactured in the patent Victoria stone.

Messrs. C. KITE & Co., Chalton Street, Euston Road, have their usual collection of ventilators, cowls, &c., and we can remind our readers that Mr. KITE was one of the earliest manufacturers of a chimney-cowl holding any pretensions to success. In connection with their exhaust roof ventilators, we may mention their invention for stables, cow-houses, &c., which by means of valves enable them to be regulated to the greatest nicety in winter time. This is, no doubt, the most complete arrangement for this class of building now before us. They can be made to fit on ridge, lean-to, or flat roofs with equal success, and the large number sent out by the firm testify to the success they have experienced. Their drain ventilators have been described by us on a former occasion, and are still made a speciality by the firm. One of their most recent inventions is an improved chimney-breast ventilator for extracting the foul air from dwelling-rooms. This is built up on somewhat similar principles to their other exhaust ventilators, and, having no loose parts to make an unpleasant noise, may be considered an improvement on many of a similar character now offered for sale.

The Somersetshire watering-place, Weston-super-Mare, contributes its usual similar assortment of red terra-cotta wares from the manufactory of Mr. JOHN MATTHEWS. Besides the "POOLE'S Patent Bonding Roll Roofing Tiles," of which Mr. MATTHEWS is the maker, he sends a multiplicity of specimens of garden vases, of all sizes and designs, the great merit attaching to them being their remarkable low cost, combined with their excellent outlines. We do not notice any particularly new feature in Mr. MATTHEWS' productions this year, but the clay he works is of such a nature that he can produce a most attractive class of articles at such a price that few firms can compete with him.

Messrs. W. LAWRENCE & SON, who are timber merchants and builders at Datchworth, Stevenage, Herts, show a small greenhouse and pit, glazed by their improved system, which is effected by metallic bars of a peculiar section,

requiring no painting of bars or puttying. The advantages claimed for this invention are that the glazing can be done in any weather, and that repairing is easily and quickly accomplished, and that no condensed water can drop into the house, as all moisture is run into grooved bars. This system is a very useful one from the ease with which new panes may be inserted, which can be done by a gardener or any other individual inexperienced in the glazier's art. We should be sorry to express a decided opinion as to which of the principles of "dry" or metallic bar glazing now before us is the best; but, from the host of testimonials in the possession of the firm, it is clearly evident the one on which they have expended their ingenuity is not the least successful.

The Bower-Barff Rustless Iron Company (Limited), of Queen Victoria Street, and Skin Market Place, Park Street, Southwark, contribute a variety of specimens of iron and steel protected by the patent process of Professor BARFF, which has now become matter of history. Into the merits of this system it is not necessary to enter here, but we regret that so valuable an invention is not more extensively used. Considering the great extent to which iron and steel enters into our most ordinary requirements, and the constant annoyances experienced from oxidation or rust, it is curious that, because an invention that will secure an appearance unimpaired for years costs a trifle more over painting or bronzing, it is not more largely adopted. We have seen a specimen of iron that has been trailed in the wake of a vessel for months in sea-water, and afterwards allowed to dry of its own accord, that has not been affected in the smallest possible manner by its immersion, and the Company exhibit a variety of specimens of all classes of work, from the common iron gas or water pipe to those of the most elaborate and artistic articles, that have been treated by their process for a length of time, and have not been affected, that illustrate its preservative qualities far better than words can testify.

Amongst the exhibitors generally to be found at the building exhibition Mr. HENRY HOPE, of Birmingham, must not be overlooked. Mr. HOPE's exertions in connection with horticultural buildings, wrought and cast-iron windows, deserve recognition. As an horticultural builder he takes a prominent position, but if we exclude his collection of hot-water apparatus in their several applications, his exhibits on this occasion consist more of the improved arrangement for windows than of conservatories. The iron used for casements and frames is rolled solid, insuring a perfect fit, and avoiding the rattling and whistling so objectionable in windy weather. The many examples of these appliances shown cannot be described without the aid of diagrams, but their advantages are made clearly palpable to those who visit the stand and examine the details. Mr. HOPE's catalogue, which is freely distributed, contains a large number of engravings which must make the advantages of which we have been writing clear to the most common understanding.

Messrs. MEAKIN & Co., Baker Street, W., exhibit a full-sized model of a window, with their patent sash fastener and opener, that provides a convenient means of opening and closing the top sashes of large windows, while it also locks automatically both sashes when the window is closed or left open a certain distance for draughtless ventilation. The arrangement is of simple character, and of reliable construction. The necessity of such an arrangement, for large and heavy windows in particular, has long been acknowledged on all hands, and Messrs. MEAKIN's invention may fairly lay claim to be one of the best of the many that have been introduced for the purpose. They also exhibit their new patent "Oilable Sash Pulleys" having large bearings, specially adapted for heavy sashes, which combine great strength and durability with a moderate cost. The axles of the pulleys can be lubricated without difficulty, which greatly enhances their lasting qualities, and enables them to be moved more freely than when the windows are fitted with the ordinary pulleys. Many of the principal architects have specified for Messrs. MEAKIN's inventions in preference to others on account of their simplicity and excellent character.

Messrs. BELLMAN & IVEY well maintain their reputation for the class of decorative work to which they have so long devoted themselves. The display made on the present occasion is one of the best we remember to have seen. Some verde antique columns are shown with enriched Composite capitals, and others of sienna with Corinthian capitals. A specimen of the lower portion of the paonezzetta columns as supplied for the

Carpenters' Hall, others of parian Doric with fluted shafts as fixed at Crowe Hall, Bath, another of fluted rossi-di-sevanti, made for Coxledge Hall, Newcastle, are all artistic works of high order. There are also some examples of dados made for notable buildings—for example, the Carlton Club and for the Municipal Buildings at Hastings. A section of another in red porphyry and brown Belgian, with pilasters in sienna, made for the Royal Association of Scotland, Pall Mall, is a magnificent decoration. There are in addition two samples of balustrading, one of which has a green serpentine capping and base and brown Belgian balusters, that have received high commendations; and interspersed with all these specimens are numbers of pedestals and statuary, &c., in terra-cotta, parian, and marble. Several enriched capitals in different orders of architecture, in plaster and parian, add to the varied character of the display, which we cannot attempt to describe individually. There are two very fine chimney-pieces, one in brown Belgian and the other in brocatella, and samples of wall-linings. To illustrate clearly one of the most notable uses of their material scagliola—viz., for covering iron or brick cores—an example of its adaptability to such purposes is exhibited without the slightest signs of a joint being visible. Messrs. BELLMAN & IVEY's display is one of the most artistic in the hall, as well as standing alone with regard to the special material of which the decorations are manufactured. The firm do not, however, confine their exertions purely to the arts; they have recently entered the arena of sanitation, and in their BELLMAN's patent gully, which is suitable for all purposes, both in and outdoor, they have secured a very useful appliance. As we gave a full description of this article on its first introduction we need not recapitulate it here. The gullies are shown at their stand.

Messrs. RENDLE BROTHERS, Westminster Chambers, Victoria Street, S.W., are present with their "Electric" paint-remover, of which it is impossible to say more than already has been said in the columns of *The Architect*. It is a remarkable substance, and as useful as it is quick and ready in action. Its effect in removing paint even from very old painted wood will surprise many. It is easily applied, and cheaper than other preparations professing to perform similar work.

Messrs. WM. EDGECUMBE, RENDLE & Co., of the same address as the last-named firm, exhibit a model illustrating their patent systems for glazing roofs of railway stations, conservatories, and the many buildings fitted with "sky" lights. To enter into a detail of the sections of bars and system on the present occasion is quite unnecessary, as we presume there is not an architect in the kingdom who is not acquainted with the system; but we may mention in its favour that the Government are adopting it generally, and at Woolwich we believe every roof is glazed on Messrs. RENDLE's plan. One of their recent successes has been the glazing of the new Citadel station, Carlisle, the area of glass covering 350,000 feet. It is practically indestructible in principle, and one of its greatest recommendations for general purposes is that "gardeners" speak well of it.

The Indestructible Paint Company, Cannon Street, have an imposing structure, on which are arranged samples of their indestructible and enamel paints, BROWNING's patent invisible preservative solution, and a variety of articles, including bricks and different kinds of stone coated with it. Amongst other public buildings and monuments that have been coated with the solution may be mentioned Cleopatra's Needle on the Embankment. It has also been much used at the British Museum and at the Science and Art Department, South Kensington, for coating fossils and geological specimens, having the effect of keeping them in first-rate condition for any period. The properties of this solution, as is now pretty well known, thoroughly preserve such articles when covered with it not only from the effects of the weather, and render them water and damp-proof, but, what is infinitely of more value, from the disastrous effects of an atmosphere surcharged with carbonic acid as is that of the metropolis. A sample is shown demonstrating this. It consists of a slab of stone, which, being coated with the solution and exposed to the atmosphere close to a chimney, eventually became black with soot, &c. A portion of the slab has had this soot cleansed from it, a thing that would be impossible to do had it not been coated.

Amongst the manufactures of roofing felt Messrs. ENGERT & ROLFE, of Poplar New Town, E., hold a position second to none, and show various qualities and species of this material, for which they are becoming more and more celebrated. At

this stand are to be seen rolls of asphalted roofing felts, sacking felt, inodorous bitumen felt, felts for lining, and hair felt, which have been taken indiscriminately out of stock, so that one can see the exact thing they are buying. A block of brickwork is shown here standing in a shallow cistern of water, where it has been for several years, demonstrating the efficiency of their fibrous asphalte for damp-proof courses.

Messrs. CAPPER, SON & CO., Ingram Court, Fenchurch Street, show a very good assortment of sanitary appliances. The noteworthy feature at this stand is PEARSON'S patent trapless twin closet, the salient features of which have been pointed out on former occasions. We may, however, remind our readers that it is made entirely in one piece of best earthenware, with the twin chamber forming a water-supply cistern, in which is fixed the ball-valve, by its side, and a plug covered with a substantial body of indiarubber and a sufficient water-seal effectually prevent the admission of sewer-gas into the house. This closet is also shown fitted with BRIAN JONES'S patent joint, which is a simple and effectual means of connecting it with the soil-pipe, and at the same time prevents the inroads of rats to the house from the sewer. The firm exhibit some very attractive lavatories, as well as one or two patent folding ones for use in offices or chambers on shipboard, or as part of an officer's baggage, or in any place where space is an object. One of these particularly struck us: it is composed of four compartments. The top one contains toilet-fittings, next is the washing-stand, below this a pail to receive the dirty water, and at the bottom of all a place for soiled linen or other sundries. The arrangement for holding the basin is ingenious, and when not in use so fits into the cabinet by merely raising a door that the space occupied by the latter, measuring outside, is only 2 feet 6 inches wide and 7 inches deep, the height being about 5 feet. Baths, lavatory and bath-fittings, and other sanitary sundries complete this exhibit.

Messrs. C. DRAKE & Co., Limited, Railway Wharf, Battersea, S.W., have this year taken up their position at Stands F 194 and G 232, a much lighter and more prominent part of the hall than that allotted to them last year, in which respect they were then at some disadvantage. The collection comprises samples of the various articles for which their patent mosaic concrete is adapted, including baths; mantel-pieces, fender-kerbs, counter and lavatory tops, jointless pavements, steps, stair-treads, &c., as well as a variety of coloured concrete window-heads, string-courses, copings, terminals, &c., not forgetting a section of mosaic concrete moulding, as made for the proscenium of the new Grand Theatre at Islington. At either end of the stand is also shown a portion of the patent concrete building apparatus, for which Messrs. C. DRAKE & Co. have much patronage; in fact, it has been used in the construction of many buildings of any note in which concrete forms any considerable part.

Another firm who appear to have taken more pains this year in the arrangement of their exhibit is Messrs. ELLIS, PARTRIDGE & Co., 10 Market Street, Leicester. The most conspicuous form their efforts have taken is the structure built up by them. The walls of this are of their red Fareham facing bricks, in which an ornamental brick keyed arch, of a very pretty design, forms an important feature, at once relieving the heaviness of a plain wall and showing what the firm are capable of turning out. It is covered with an ordinary span roof, one side of which shows different designs of their Broseley tiles, the other displaying some first-rate slates, with suitable terracotta ridges and terminals. In addition to the foregoing, they show a large assortment of ornamental and moulded bricks in white, buff, and red, every kind of the well-known Staffordshire blue bricks, quarries, &c., as well as several new patterns in string-courses, cornices, &c. We must not omit a very important branch of Messrs. ELLIS, PARTRIDGE & Co.'s business—viz., their slating department, which comprises specimens from the well-known quarries at Penrhyn, Portmadoc, Carnarvon, and other places, and which they are enabled to deliver direct to any station or port. They are also special contractors for the well-known Barrow blue lias lime, of which specimens are also shown at Bay 67 in the arcade.

The Hygienic Heating and Lighting Co., 43 Park Street, Islington, and Finsbury, make an attractive show with their now well-known syphon stoves. Most of our readers are doubtless acquainted with them, but we may say that by means of an argand burner placed about midway in a cylindrical or pillar-shaped stove light is provided, and the heat, after passing upwards and circulating around the top is carried downwards,

and the products which have become condensed pass in the form of water into receivers. Mineral oil can be used instead of gas if preferred, and they are well adapted for bedrooms, greenhouses, &c.; and, when we mention that since they were originally introduced by one of the members of this Company, many firms have been induced to imitate them, it is evidence of their popularity and a strong recommendation. The firm are also showing this year gas-cooking stoves constructed on a similar principle and which they likewise term "Syphon," and among the advantages of them is the plan adopted for carrying away the products of combustion, which is arranged so as to utilise the maximum amount of heat.

A few paces from the last-mentioned stand, and situated a little nearer the main entrance, is the exhibit of Mr. WARHURST, of Highgate Road, N.W. This firm has an old reputation for their horticultural buildings, and also for the necessary boilers and apparatus for warming them; and here are to be seen a first-rate assortment of the latter, comprising the "Monarch" boiler, for heating large quantities of piping; "Ben's Boilers," for similar purposes; and the "Victor," "Little Hero," and other small boilers and pipes, forming complete apparatus in themselves. Mr. WARHURST has lately made some improvements in "Ben's Boiler," which consists of a new form of tubular crossbridge in the form of an inverted T-piece, and has been found to greatly increase the circulation and heating power, as it lies on and across the fire with an upper outlet into the flow-pipe. We are informed that one of these boilers is fixed at the Army and Navy Stores, Victoria Street, Westminster, heating nearly a mile and a half of pipes, and giving great satisfaction.

Messrs. BEATY BROS., Devonshire Buildings, Carlisle, show several samples of Newbiggin red stone, as worked by them at their quarries near Carlisle. These are amongst the oldest worked quarries in the North of England, and have furnished the stone for some of the most important works and buildings in that as well as in other parts of the country. It possesses many good qualities, and from its particular property of being almost insensibly affected by sulphurous acid gas and the action of smoky atmospheres, is well suited for use in the metropolis. The specimens shown comprise a Queen Anne door-case, from the designs of Mr. C. J. FERGUSON; a copy of a round tracery window from Carlisle Cathedral, and specimens of facing work; also a sample of shap granite concrete flag.

Messrs. F. ROTHER & Co., Lime and Cement Manufacturers, and Brick, Tile, and Slate Merchants, of Upper Ground Street, Blackfriars, S.E., Sittingbourne, Kent, and other addresses, also make a very creditable display with the above wares, which are here to be seen in every conceivable variety and design, as well as in different qualities. The dark and light red and white Suffolk facing-bricks are specially worthy of attention, so are the red and white arch bricks and key-blocks, plain and ornamental, some of the patterns of which latter are very neat and effective. A leading feature of this firm is their improved stable paving-bricks, and, though they have been before the public for about thirty years, we understand the demand is still very great for them. They are made in bricks and in cubes, the surfaces being divided respectively into two and four squares, the edge of each of which is bevelled, and so, forming drains, renders the beds drier. As regards durability, it would probably be impossible to surpass them, as they are made from clay strongly impregnated with iron, and, when baked, is of the hardest description, and known as terra-metallic ware. Messrs. ROTHER'S artificial stone goods, such as statuary, vases, fountains, trusses, &c., as well as the different limes, cements, &c., made by them, have such a well-established reputation that further comment upon them would be superfluous.

Messrs. LASCELLES & Co., 121 Bunhill Row, E.C., principally confine themselves this year to showing specimens of their concrete; and to give one an idea of the important purposes it is being used for, nearly everything exhibited is specially made for works the firm have in hand. They comprise a large mullion window, with enriched panels and entablature, for Mr. J. A. MAITLAND, Eastbourne, designed by Mr. WM. KIDNER.; another ditto, of a similar character, designed by Mr. EWAN CHRISTIAN; a Gothic window, with tracery, for Lynn Schools, Norfolk, by Mr. J. HATCHARD SMITH; and a piece of enriched gallery front, in concrete, for Epsom Town Hall, by the same architect. In addition to these are two concrete chimney-pieces, which are of good

design and first-rate execution; as well as sundry copings, cornices, caps, steps, balustrades, &c., which, with a few articles of joinery, also for works in hand, make up this exhibit.

Messrs. NEWTON, CHAMBERS & Co. (Limited), Thorncliffe Ironworks, and Great George Street, Westminster, send three of their popular patent Thorncliffe open and close ranges, of different sizes, and a new one, named the "Economist Portable," built on somewhat the same lines. These excellent ranges have been so many years before the public that detailed description is no longer necessary. They are admirably constructed and exceedingly well made, and for their size offer a large surface for the various cooking purposes. The Economist is well named, as it consumes only two pounds of coal per hour when in full work, and absolute uniformity of heat is secured around the oven, and it performs its functions admirably. The Company also send one of their 20-inch garden rollers with double cylinder, notable for being lathe-turned at the meeting surfaces, and in having rounded edges to avoid injuring the grass in turning. They exhibit, in addition, some building ironwork, including four window-heads of different patterns, some corbels, rain-water pipes, heads, &c. They also introduce to our notice three samples of balusters and eight different pattern newels. It is only fair to say that the castings are all good and clean, and we believe the Company are in a position to execute the ordinary class of ironwork used in building at prices that will compare most favourably with those from any part of the kingdom.

Messrs. JAMES SLATER & Co., of the Holborn Engineering Works, High Holborn, such a collection of high-class gas-cooking apparatus as is rarely seen at any exhibition. A feature in which these appliances differ from most others we are accustomed to see is the very high finish to which they are subjected, and the jacketing of mahogany which encircles the whole, as in the steam cylinder of an engine. The firm were awarded a silver medal at the late Smoke Abatement Exhibition at South Kensington for excellence of manufacture, an award secured by no other firm of gas engineers who were present. The display here is of a multiform character, including roasting ovens, a kitchener, independent boilers for water, circulating boilers, steamers for all kinds of viands, &c., the whole heated by gas, and all manufactured in the manner described above, and they have deservedly attracted a considerable amount of attention.

In the materials known as carton-pierre, fibrous plaster, and papier-maché, Messrs. WEBB & Co., 294 Euston Road, occupy a prominent position in the galleries, and to show how easily the materials can be manipulated, an artist has been daily engaged in carrying out certain works. The principal articles shown in the exhibit are three chimneypieces in pure white, the designs of which have been delineated on a wood groundwork, with the assistance of each of the materials according to their adaptability to the different features. One of the chimneypieces is an exact reproduction of an old carving in wood, and exemplifies how readily the most intricate designs can be assimilated in these substances. Another is after a design of PERGOLESI, about the time of the brothers ADAM, the figures standing out well in relief, and the most delicate tracery having the sharpness of the finest wood-carving. The third is in the Queen ANNE style, less pretentious as regards the ornamentation, but no less a work of art than the accompanying examples. There are many specimens of ceiling roses in a variety of styles of architecture, and also ceiling ornamentation generally, all evincing careful thought and exquisite workmanship. In connection with Messrs. WEBB's exhibit are shown a variety of tiles from the *ateliers* of MALKIN, EDGE & Co., of Burslem. The name of this firm is sufficient to intimate to the reader that what is exhibited is well worthy of attention. The tiles embrace samples of all varieties, from the plain white and white with blue diamonds suitable for larders, dairies, lavatories, &c., to the most costly in design. Many of them are treated conventionally, others with embossed subjects, and in the low-toned colours now so prevalent, while the acquisition of printing for the purpose of producing subjects from history and the poets, as well as the ideal fancies of the artists, at a low price has not been forgotten. A selection of designs in encaustic tiles help to make up a very excellent collection.

Messrs. E. ALDOUS & SON, Queen's Road, Peckham, exhibit the ventilators with which their name has become connected, as well as a new hot and foul air extractor recently patented by them. This appliance is intended, as its name

implies, to extract all the vitiated air from a single apartment or from the entire house by automatic means, and arrangements can also be added for the introduction of fresh air from the exterior if desired, although the contention of the firm is that for ordinary domestic purposes the latter is not necessary, so that the work is effected by means of the exhaust ventilator only. This consists of two concentric shafts, between the inner and outer one a space being provided for the foul air to pass upwards. In the inner one is a conical bottom, and directly above are apertures for the wind to escape into the outer shaft. There are eight apertures in the head to receive the wind from whatever point it blows, after which it is taken into a concentrating shaft, whence it travels down and around the conical bottom, makes its way through the apertures in the inner shaft to the outer one, and, converting itself into an up-current, forces the foul air from between the two to the top, and so out of the escape. It is clearly palpable that this principle converts a down-draught into an up-current, and it is the only one we know of made on the same principle in the market. The inventors claim that it will exhaust more foul air in a given time than any ventilator now before the public; and, judging from the examples in action shown at the stand, it is as equally effective for horizontal work, such as tunnels of railways, &c., as it is for vertical uses. The principle upon which it is constructed appears a sound one, and we see no reason to doubt its efficacy.

The exhibition will close on this (Saturday) evening.

PARIS NOTES.

A MEETING of the members of the Société Libre des Artistes Français has been summoned to consider the question of the Luxembourg Art Collections, which the Senate threatens, or rather coolly proposes, to turn out of their present quarters. One of the reasons alleged by the authorities of the Upper Chamber is that the portion of the building now allotted to the Museum is admitted by artists to be much too limited for its purpose; but before disturbing the collections it is evident that some building must be found for their reception. Some time ago it was proposed to utilise the present site of the Tuileries for the erection of a museum of modern art, and plans, estimates, &c., of the projected building were prepared by M. Granier. Nothing further has, however, been lately heard of this proposition, which would have to be approved by the Chambers. In the meantime M. Etienne Arago, director of the Luxembourg Museum, has made a proposal that may be taken as a compromise. He suggests that the Orangery in the Luxembourg gardens, which would afford double the space now set apart for the collections, shall be fitted up to receive them. In front and at the back and sides of this building verandahs of iron and glass work would be erected to receive the sculptures and statuary, the effect of which would be greatly enhanced by the introduction of shrubs and rare plants. As far as this portion of the collection is concerned, the proposed arrangement would certainly be a vast improvement over the badly-lighted galleries in which the Luxembourg sculptures are now not so much displayed as hidden. The gardens and the palace itself belonging legally to the Senate, no difficulty or delay need occur in the concession of the Orangery for the use of the Fine Arts department, and this will probably be accepted as a temporary solution of the matter. The buildings commenced during the autumn of 1881 in connection with the Luxembourg are now finished as far as the exterior is concerned, though the fitting up and decoration of the inside will probably not be completed before the end of the year. The new building, which borders the Rue de Vaugirard, is neither a new wing nor an annexe of the palace, as its appearance might lead one to suppose, but simply a connecting link between the Grand and the Petit-Luxembourg, and has been constructed mainly with a view to establish a direct communication between the Senate chamber and the apartments of the President of that body.

It may be remarked that the Luxembourg consists of three distinct sets of buildings that have never been placed in thorough communication with each other. The principal block, designed by Jacques de Brosse, has preserved its original form, with the exception of some stables, coach-houses, and other offices removed many years back. To this Marie de Médicis added a large mansion bearing the name of Hôtel de Luxembourg, for the simple

reason that François de Luxembourg, Prince de Tingry, had purchased it in 1570. The queen-mother acquired it in 1612, together with some other neighbouring buildings, on the site of which she constructed what is now known as the Petit-Luxembourg. Various means of connecting these separate buildings have been adopted from time to time, but between the Grand and the Petit-Luxembourg there has never until now existed any but a provisional communication.

The new building, made from the plans of M. Charles Goudoin, architect to the Senate, is in harmony with the general style of the palace, which it may be said to complete. The ground-floor will be occupied by printing and correcting-rooms for the publication of the Parliamentary reports, while the upper story forms a gallery running from the President's apartments to the Salle des Séances, which he may thus reach without having to cross the gardens.

At the opening of the next session of the Paris Municipal Council M. Alphand, Director of Works to the City, will submit the following proposals drawn up by the committee lately appointed by the Prefect to consider the question of rents and cheap dwellings for the working-classes: (1) Houses built with the guarantee of the City, whether they do or do not benefit by any reduction or exemption from municipal or State taxation, will, after amortissement, revert to the City for four-fifths of their value. The amortissement is to be completed in fifty years, and any reductions or exemptions accorded will continue during the whole of that period. (2) Those owners of house property who agree to reduce their present rents by 30 per cent. will participate in the advantages offered by the City and the Government to the builders of new houses. (3) Property unlet or standing empty will henceforth be considered as in the occupation of the landlord, and will consequently enjoy no exemption from taxes. After these proposals have been considered and voted by the Council, a scale will be drawn up fixing the terms and conditions under which the various kinds of buildings are to be constructed, their number, cost, &c.; and the project as a whole will finally be brought before the Chambers for approval.

At the last sitting of the Commission of Historical Monuments, M. Antonin Proust announced that he had received an assurance from the Minister of Fine Arts that a sum of 50,000 francs should be devoted to the Trocadero Exhibition of Comparative Sculpture, out of the special credit of half a million francs voted in last year's budget for the purchase of works of art. The question of the preservation of the Arènes de Lutèce was discussed at some length, and a resolution adopted whereby the Paris Municipal Council and Administration are requested to clear and preserve as great a portion of the Arènes as possible by enclosing them in a public square. The Commission further adopted a project for the isolation of the Gallien Palace at Bordeaux, classed the Church of Lescure in the Tarn as a historical monument, removed the Church of Saint Cyprien (Dordogne) from the list, and inscribed among the Megalithic remains the dolmen of Port Blanc at St. Pierre-en-Quiberon (Morbihan), and the lines of Cancaret (Finistère).

M. Falquière, the sculptor, has submitted to the Cahors Municipal Council a sketch of the monument which he has been requested to design in honour of M. Gambetta, who was a native of that town. The artist's idea has been to represent the deceased statesman in his quality of patriot. In the design Gambetta stands erect, his right hand resting on a gun-carriage; at his feet lies a wounded soldier. On each side of the pedestal is a marine and a linesman in attitude of combat, while the foreground is occupied by an immense flag, terribly torn. The monument will be upwards of 12 mètres (40 feet) in height.

The competitors who presented themselves in the first stage of the Prix de Rome for painting numbered 106. The subject was *Pompey Bidding Adieu to his Wife and Child*. Of these, twenty were chosen to take part, together with those pupils that are exempted from the first trial in the second stage of the competition. The subject selected for this was *The Flight of Tullia, Daughter of King Servius Tullius*, and the Painters' Section of the Académie des Beaux-Arts, aided by the assistant jurors, ranked the first ten, according to the merits of their sketches, as follows: Gaillard, pupil of M. Gérôme; Millochau, pupil of MM. Cabanel and Feyen-Perrin; Tollel, pupil of MM. Cabanel and Bin; Cabane, pupil of M. Bouguereau; Prouve, pupil of M. Cabanel; Pinta, pupil of the same artist; Baschet, pupil of MM. J. Lefebvre and Boulanger; Lebel, pupil of M. A. Millet; and Charpentier, pupil

of MM. Bouguereau and T. Robert-Fleury. These ten are, therefore, entitled to the *loges* for the final contest.

The Lambert Prize of 1,600 francs has this year been divided by the Académie des Beaux-Arts among the widows of five artists. The Academy will next allot the Bardin Prize of 3,000 francs for the best work on the history of the various styles of architecture, and examine the claims of candidates for the newly-founded Deschaumes Prize, the conditions of which are somewhat peculiar, as it can be awarded only to some young architect "living with his sister in the greatest harmony, and who has given abundant proof of his excellent morality and fraternal virtues." The Paris journals rather malignantly remark that such a phoenix will be extremely difficult to find among French art students.

The Aguado sale at the Hôtel Drouot realised a total of 280,000 francs. The gem of the collection, *Portrait of a Monk*, by Murillo, was sold to M. Ed. André. It is generally regretted that the Louvre authorities did not purchase this masterpiece.

A magnificent collection of paintings by old, as well as by some modern, artists was sold last week at the gallery of M. G. Petit, in the Rue de Sèze. These works had been carefully selected from many previous art sales in different parts of Europe by M. Narischkine, whose good judgment was fully vindicated by the results of the sale, the eighty-five works disposed of having realised the enormous sum of 1,085,740 francs, an average of nearly 517*l*. *The Old Woman*, by Rembrandt, fetched 51,000 francs (Baron de Beurnonville); *The Fish-seller*, by Gerard Douw, 51,000 francs (Mr. Mackay); a small figure, by Terburg, 55,000 francs (Baron de Rothschild); *The Consultation*, by Peter de Hooze, 160,000 francs (Mr. Cedron); *Portrait of Senator Muffel*, by Albert Dürer, 78,000 francs (Berlin Museum); *A Study of Four Negro Figures*, 55,000 francs (Baron de Rothschild); *Hay Harvest*, by Wouvermans, 53,000 francs; *Portrait of a Lady*, by Reynolds, 18,000 francs; *Love Vows*, by Fragonard, 42,000 francs; *L'Abreuvage*, by Troyon, 80,000 francs; and *Marching Order*, by the same, 42,000 francs.

During the past week the elections for the Salon juries in the sections of architecture, engraving, and lithography, have been held with the following results: Section of Architecture—MM. Vaudremer, Bailly, Brune, Questel, Rollin, Ballu, Garnier, André Hénard, Mayeuse, and Daumet; Supplementary Jurors—MM. Diet and Corroyer. Section of Engraving and Lithography: Engraving—MM. Didier, Blanchard, and Gaillard; Etching—MM. Bracquemond, Waltener, and Chauvel; Lithography—MM. Vernier, Ciceri, and Chauvet; Wood-Engraving—MM. Huyot, Pannemaker, and Thirial.

THE ARCHITECTURAL ASSOCIATION.

THE tenth ordinary meeting of the Association was held on Friday evening the 6th inst., Mr. E. G. Hayes, president, in the chair.

The PRESIDENT said he had to announce the resignation of a very old and well-known member of the Association, Mr. R. E. Pownall, by reason of his appointment, as Director of Works, in the colony of Sierra Leone, South Africa. The members knew how hard Mr. Pownall had worked for the Association, and while regretting his loss they would congratulate him on his appointment.

Mr. PRATT, hon. librarian, said that a donation had been made to the library of "The Buildings of Sir Thomas Tresham," by the author, Mr. J. A. Gotch. A vote of thanks was consequently passed to Mr. Gotch for his gift.

Mr. EALES, hon. secretary, announced that the next visit would be made to St. Paul's Schools, Hammersmith. In connection with the late visit to the Liverpool Street Station, a vote of thanks was awarded to Mr. C. E. Barry. The forthcoming *soirée*, the members were informed, would be held at St. Andrew's Hall, Newman Street.

Mr. J. DOUGLASS MATHEWS, hon. treasurer, called attention to the work of the Architects' Benevolent Society, and proposed that the members of the Association should vote a yearly subscription of ten guineas to the funds of the society. The proposition was seconded by Mr. Cole A. Adams and agreed to.

Mr. F. T. BAGGALLAY then read a paper entitled

Italy.

At the conclusion of the paper, which will be found on another page,

The PRESIDENT said the large audience present, and the round of applause they had given to Mr. Baggallay, testified to the interest which had been taken in his paper. Mr. Baggallay was an earnest student, and it could be well understood that he had started abroad for his tour in Italy with misgivings that he would

be disappointed, and that after all he had come back charmed with the beauty of form and colour that met the eye in every part of that country. As students they would do well to bear in mind the necessity of cultivating the faculty of observation, because, though many of them got the opportunity of making a tour in this country or elsewhere, they did not always make as good use of the opportunity as they ought. The question of marble veneering had been much discussed from time to time, and there always had been, and he supposed always would be, two opinions on the subject, viz., one that it was right, and the other that it was wrong. The right application was, however, he thought, to use it in panelling and such parts of a building as were obviously not constructional. He did not think the effect of veneering Giotto's campanile from top to bottom was satisfactory. With regard to buttressing, it was unneeded in Italian buildings, as, owing to the absence or small size of windows, the walls were proportionally stronger and able to resist the thrust of vaulting.

Mr. T. BLASHILL proposed a vote of thanks to Mr. Baggallay. He said he had made a point of being present that evening, and that the interest of the paper and the wealth of drawings hung on the walls, well repaid the trouble of coming. With regard to the two towers at Bologna, Mr. Blashill said he believed they were not built to rival the celebrated tower of Pisa. He thought they were built before it. They were erected by two rival families. The first was built to a considerable height. The architect of the second built his tower higher, and it went out of the perpendicular. The first tower was then added to and carried up higher still, and this also was somewhat out of perpendicular. Mr. Blashill said that in two journeys in Italy, though actively employed, he had seen a dozen towns pretty well, and seemed to recognise nearly all the sketches exhibited on the walls. In the church attached to a monastery near Milan, he had seen a good deal of carved foliage which he should have put down to the thirteenth century. As to the execution of carved foliage in Italy, he considered the carvers must have worked in the winter, when there was little natural foliage to be found, and not in the summer time on account of the heat. In England it would have been done in the summer, when natural foliage was at its best, and this was one reason why he thought the work must have been better designed and executed in England. He thought the younger members would do well to save up their money a little longer, and make an extended tour rather than fritter it away on short tours.

Mr. S. VACHER seconded the vote of thanks. He said he had come to the conclusion that there was not a single Italian tower upright. The whole of the campanili seemed to have gone to one side or the other. It was a particularly happy idea to make the bases perfectly plain up to a great height, and reserve enrichment for the upper and lighter parts. There was a fine specimen of foliage carving at the Ducal Palace, Venice, and at the Ca d'Oro Palace; carving essentially Italian and characteristic. He thought many of the members would make a trip to Italy if they knew how cheaply they could live, and how easily they could get on in out-of-the-way villages if they had a slight smattering of French.

Mr. PRATT said it was a characteristic feature of the towers in Italy that the tower should grow lighter the higher it went, and constructionally this was right. He thought the poverty-stricken look of the foliage was due to the hard nature of the materials it was wrought in, which was very different from our freestone. About the caps there was often positive ugliness.

Mr. TRUBSHAWE remarked that the employment of terra-cotta was synonymous with delay; the use of it involved no end of time and trouble. Della Robbia was objectionable owing to its shining surface.

Mr. MILLARD said the Italian work was essentially suggestive. It was full of things one did not like, but at the same time was full of suggestiveness.

Mr. A. B. PITE then made some remarks, after which the vote was put to the meeting and carried.

Mr. BAGGALLAY replied, and said that Mr. Blashill was no doubt right as to the origin of the two towers, and that he had most likely been misled by the generally-received story of the lower tower having been erected to rival the leaning tower of Pisa.

The proceedings then terminated.

INSPECTION OF FACTORY CHIMNEYS.

THE following letter from Lieut.-Colonel Seddon, R.E., was read at a meeting of the Bradford Town Council on Tuesday. It was addressed to the Secretary of the Local Government Board:—

"Sir,—Referring to my report on the fall of the chimney at Bradford already forwarded, I omitted to mention a point which I think ought to be brought to the notice of the Home Secretary, namely, that neither in Bradford nor in Leeds are there any building regulations analogous to those contained in the Metropolitan Building Act. Beyond fixing a minimum height for factory chimneys there are no regulations to insure their safe construction or that of any other buildings. Some such regulations seem to be required in these large commercial centres; for instance, the

means of egress from lofty factories, crowded with operatives, are often so narrow and limited that the results of a fire would be terrible to contemplate. That the safety of those who are crowded together in some of these factories is often not sufficiently consulted is evident also from the existence very near the site of the disaster of another chimney, about 103 yards high, bending over considerably at the top, so much so that the owners, after what had occurred at the Ripley Mills, decided to lower it 100 feet, which work had just begun when I left Bradford. The foundations of this chimney, I ascertained, had been carried down to the rock seating of the old coal seam below, and the old structure had been far better put together than the chimney that fell. The general impression, however, that its appearance conveyed to the mind from a little distance was certainly one of insecurity, whilst it seemed to have been watched anxiously by the people about during any heavy gales; at the same time, when viewed close by, it looked solid and safe. Such a lofty chimney, however, rocks considerably in heavy winds; and although the coincidence might not have occurred in a hundred years, still an exceptionally heavy gust just happening to catch it when full on the swing might have caused a terrible accident. The question is, whether such a doubtful structure, surrounded by factories full of operatives, ought to have been allowed to remain standing until the owners, warned by the havoc and loss of life brought about by the fall of a neighbouring chimney, thought it best to put an end to the risk.

MATLOCK BATH WATER SUPPLY.

AN inquiry was held by Captain Robert C. T. Hildyard, an Inspector of the Local Government Board, at Matlock Bath on the 4th inst., with respect to an application from the Local Board of Matlock Bath and Scarthin Nick for sanction to borrow the sum of 6,014*l.* for the purchase of the undertaking of the Matlock Bath Waterworks Company, and for the execution of works of water supply. In the year 1881 Messrs. G. B. Nichols & Sons, civil engineers, of Handsworth and London, were called in by the Local Board to report upon a scheme for water supply and to value the company's works. Their valuation amounted to 1,763*l.* The company's engineer, Mr. C. H. Roper, of Dudley, valued the works at 2,759*l.* 7*s.* 6*d.*, and in March 1882 an arbitration was held, Mr. W. Batten, C.E., as umpire, whose award was 1,907*l.* 10*s.* Messrs. Nichols & Sons estimate the cost of constructing new works and extending the present sources of supply at 4,077*l.* 3*s.* There was no opposition to the application.

TRUE ART.*

By JAMES ORROCK, M.I.P.W.C.

(Continued from page 235.)

BUT how about the influence those writings have had on artists? Are they in consequence of such teaching following on the road that Turner and the great masters made for them, or on that which Mr. Ruskin pointed out to them? It seems the practice in these days is exactly the reverse of Turner's, whatever other teaching there may be. Let us calmly examine the matter. We have been told that Turner was the greatest genius in landscape-painting, and that he painted the greatest number of nature's truths; consequently we are to go to nature and work zealously "on the spot." We are urged to copy inch by inch portions of rocks, trees, mountains, and skies, provided always those skies will be kind enough to wait for us. By so doing we shall then be following in the steps of the great master. Certainly Turner did make careful studies from nature, as indeed did Claude and other despised masters; but they were *studies*, and retained and used as references when such portions from nature were painted in one of their studio pictures. Their pictures were studied compositions, not large studies of bits and called completed works. No! Turner's chief works were made from memoranda, sometimes done in colour, but mostly in pencil. It is more than probable he never painted a complete picture out of doors at all, certainly none of his composition ones; and we all know that his studio work was so vast that no time was left him, even in his long life, to paint completed works from nature. Turner was, in truth, an idealist, at least as to artistic arrangement and so forth, even when he made local views, for he made grand compositions of everything he did, placing the leading features and characteristics of the subject in such positions as best suited his fancy. He was in truth a painter of grand pictures, not a servile mechanical imitator of bricks and bats; a grand imaginative composer, founded, indeed, on nature, but always on the most learned lines of art. No man knew so much of art practice and technicalities, for in these he was *par excellence* the greatest of the masters, but pre-eminently he was also the greatest of all the realists.

* A lecture delivered at a meeting of the Society for the Encouragement of the Fine Arts.

Let us ask ourselves what were the leading features of this great man's art? I shall begin by stating a negative one. He was, then, as I have already stated, not an umbrella or tent artist. No one, I presume, supposes for an instant that the *Building of Carthage*, the *Ulysses*, and *Polyphemus*, *Crossing the Brook*, or the *Garden of the Hesperides*, were painted from a tent or from the sweet shade of Winsor and Newton's delicious umbrellas. Then, as Turner clearly did not paint pictures out of doors, why are we dragooned to do this when he in the same breath is set up as our guiding star? This seems to me simply grotesque absurdity! The fact is, to the ordinary mechanic to sit down and imitate the general appearance of still life from nature is comparatively easy, and such work appeals direct to the ordinary eye. But what were Turner's great features which placed him so high above all others? For by knowing them we shall be able to see wherein we differ in these imitative days. First, then, his imagination, which of course includes his vast powers of composition, that is, his artistic conventionalism, in making up pictures. This is now called by many the "exploded art" and "non-realistic." Secondly, infinity of broken and gradated colours, the reverse of much of the work of the present day. Thirdly, luminous half shade of broken tints, with glow in the shade, which was always striven for by the great masters, and is one of the subtle realisms of nature. This power he showed most wonderfully in his finest water-colours, in consequence of the purity of colour and flexibility of the medium over oil. The present imported French method of distemper, flat, dry painting, is the reverse of Turner's work. Fourthly, infinity of curved lines which Turner alone painted, and again to be seen to perfection in his water-colour work. Fifthly, aerial gradation from foreground to extreme distance. In this also he stood unrivalled, and, strangely enough, since foreground still-life painting has become the rage, this rare and most sensitive power is almost entirely ignored. Surely this is one of nature's realisms. Some critics persistently direct attention to the painting of boulders and moss-grown bricks, truths which any ploughman can see, as if the ordinary eye could not pick out elaboration and so-called mechanical finish without the help of another ordinary eye, for this is precisely what most do see, whether it be in figure, landscape, or still life. Sixthly, Turner possessed also peculiarly fine artistic colour, but not the surface-looking likeness in colour; he painted his ideal, that in truth was the real, and which he selected from nature's varieties as seen under certain effects. This he did like all true painters from impression, because nature's effects will not wait for you.

Let us pause and consider what this artistic impression of colour, as seen under certain of nature's effects, truly means. If a painter were to appear who could imitate mechanically every feature of nature exactly, both in form and colour, as we see reflected in the mirror, popularly considered he would be a marvellous artist, and he would be lauded as a heaven-born genius. But he would after all not be more marvellous than an inventor who could produce a machine which under skilled guidance could do the same. It is not impossible that hereafter this may be done, and in these days it seems to me that there are some artists who approach closely to this mechanical perfection. Now, calmly speaking, fine artistic colour is an individuality, and to those who can see it is the one individuality of all others which stamps the work of any painter. Fine colour is still fine even when deprived of all traceable form, and strangely enough when mixed on the palette before it is placed on the canvas it can be at once detected by the "seeing eye." It is too a deep realism, for it is found in nature but only instinctively expressed by artists who are colourists. All colourists have peculiar chords of harmony of their own from which they never depart instinctively.

One great critic and some others have lauded up Turner for his observation of the varied phenomena of nature, and of which he undoubtedly made many marginal notes in writing—such as various forms in clouds during certain states of the atmosphere; truths about the sea, trees, mountains, and so forth. The artist, therefore, who carries these observations to the greatest extent ought to be the greatest man, for then he would be expressing the greatest number of nature's truths. In fact he might do this and frequently does without any particular artistic excellence whatever. In these days it is not too much to say that science has stamped everything with the broad arrow, and consequently we have had more scientific paintings of late years than have been done since the world began. But emphatically I say it is science and not art. A symphony in certain colours is not always in tune and harmony. Sometimes it is above pitch, and often "jangled out of tune and harsh." Fine colour is ideal and at the same time real, such as we find in the works of all true painters, such as we find in sixteenth-century Persian carpets and wondrous old mosaics. Those are not copies direct from nature any more than fine majolica or Spanish lustre ware is copied from nature; they elucidate no scientific phenomena of everyday nature. They have of course frequently fine designs, but their chief quality is artistic colour. There is not a name among the painters without this gift of colour; all the masters, including our own, who painted with colours were colourists, some of course of greater power than others, but each one painted in tune and harmony.

The great line of demarcation then in these days is that which

divides the painter proper, or true colourist, from the scientist who paints phenomena of nature, however exquisitely those phenomena may be diagrammed. Dewint, Crome, Cox, Müller, Linnell, Cuypp, Wilson, and Turner (in his so-called classic and exploded art manner) may well need the keen perception of the "seeing eye" to save them from perdition. The scientific eye knows them not, and for that matter does not wish to know them. But in spite of that nothing can ever remove their names from the scroll of fame, not even science.

True colour is chiefly found not in the strong, bright colours alone, but in the subtle harmonies of the neutral or half tones, which form, as it were, the setting for the powerful and masculine tones. This is also a realism of nature, and can only be produced by the greatest painters. Unless this setting be in tone, in tune, and in harmony, the whole work will be garish and false. Paint as brilliantly as you please, as William Hunt has done; exhaust the whole palette of its richest tints, by all means, but your sober and pearl tones must support or float them. The most tremendous colouring must, in fact, be laced and embroidered with silver light—what is called the "travelling light." The prism has as little to do with these silent and lovely semitones as it has with the rest of God's landscape when a dazzling rainbow or flash of living light appears on the landscape—all else, compared with those gorgeous spots, is modest and retiring.

These, then, are some of nature's deep truths, which are instinctively felt and painted as realisms by the true painter. To him the surface truths are secondary, and satisfy the ordinary painter and the ordinary eye.

Lastly, Turner's infinity in colour may be likened to mosaic work. Of this there are two kinds—the glass mosaic, and that which is composed of real marbles. The ordinary painter's work may be called "shutter painting," flat work, or even, like the glass mosaic, made up of plain self-coloured pieces; Turner's is like the agate or marble, each mosaic composed of nature's infinity. This is what, when applied to painting, Carlyle means by seeing "the true likeness, not the false superficial one of the thing he has to work in." These, again, are some of Turner's realisms, some of Turner's deep truths of nature. Although Turner was a consummate landscape draughtsman, this power with him was always secondary to what I have been speaking of.

Some years ago I saw three large canvases prepared by him for finished pictures, and the only thing to be discerned in each was an infinity of broken and trembling tints, beginning with pearls and opals at the sun, and gradually deepening without forms of any kind towards the margins of the work. Here and there were looming indications of ships and figures and distant cities, which would, in the end, as in his *Van Tromp* and *Romeo and Juliet*, have been simply accented with a long fine brush and flowing colour. I do not ask you to accept my poor words; rather go and carefully examine Turner's works of that period for yourselves.

These mystic harmonies of Turner lead me to state that, in his decline, nearly all evidence of his consummate power of drawing disappeared, and the violent and slashing criticisms which some of his latest works elicited were in consequence of this. Forgetting, or really never knowing, the grand pictures this great man produced, merciless and vapid critics laid about them for the gross amusement of the vacant and scoffing public. It is well known that Turner in his old age suffered greatly under their scourges. As instances, I shall quote a few of the so-called criticisms or biting sarcasms of those ignoramuses. In 1844 and 1845 appeared the following:—

"Trundler, R.A., treats us with some magnificent pieces—
(34) *A Typhoon Bursting in a Simoon over the Whirlpool of Maelstrom, Norway, with a Ship on Fire, an Eclipse, and the Effect of a Lunar Rainbow*—

O, Art, how vast thy mighty wonders are
To those who roam upon the extraordinary deep!
Maelstrom, thy hand is here.

(From an unpublished poem.)

(4) Great Room, *Hippopotamuses at Play in the River Scamander*;
(1311) *The Duke of Wellington and the Shrimp* (Seringapatam, early morning)—

And can it be, thou hideous imp,
That life is, ah! how brief, and glory but a shrimp?

We must protest against the duke's likeness here; for though His Grace is short, his face is not emerald-green colour, and it is his coat, not his boots, which are vermillion; nor is it fair to make the shrimp (a blue one) taller than the conqueror of Assaye. With this trifling difference of opinion we are bound to express our highest admiration of the work. It is the greatest that the English school of quiet landscape has yet produced. The comet just rising above the cataract in the foreground, and the conflagration of Tippoo's widow in the banyan forests by the sea-shore are in the artist's happiest manner. (77) *Whalers*. This picture embodies one of those singular effects which are only to be met with in lobster salad, and in this artist's pictures. Whether he calls his picture *Whalers* or *Venice* or *Morning* or *Noon* or *Night*, it is all the same; for it is quite as easy to fancy it one thing as

another. Again, we had almost forgotten Mr. J. M. W. Turner, R.A., and his celebrated MS. poem, the 'Fallacies of Hope,' to which he constantly refers us, 'as in former years'; but on this occasion he has obliged us by simply mentioning the title of the poem without troubling us with an extract. We will, however, supply a motto to his *Morning, Returning from the Ball*, which really seems to need a little explanation: and as he is too modest to quote the 'Fallacies of Hope,' we will quote for him—

Oh, what a scene! Can this be Venice? No.
And yet methinks it is, because I see
Amid the lumps of yellow, red, and blue,
Something which looks like a Venetian tower.
That dash of orange in the background there,
Bespeaks 'tis morning; and that little boat
(Almost the colour of tomato sauce),
Proclaims them now returning from the ball.
This is my picture I would fain convey,
I hope I do. Alas! *what Fallacy.*"

Those, then, are some of the specimens from the indulgent critics, whose only object was to create an empty laugh at the expense of an aged man, whose name and fame will nevertheless live while the world lasts.

The "realistic" painters in our time, for the most part—for there are of course exceptions—paint the surface truths of nature, as I have already said, all of which could be diagrammed and demonstrated. The mystic quality of the pearl or moss agate cannot be so treated. The great painter works "from the heart outwards," and "not from the skin inwards, never getting to the heart at all." Mapping, squaring, measuring, and hatching work is always tedious, but never difficult, for any normal being can be trained for such an office; it simply demands a degree of patience and an amount of mechanical skill. The great master's work is poetry, the mechanic's is nothing but common, ordinary prose. For instance, it would be easy to make a diagram of the surface truths of the sea. You could do it on a large board. First, you might show the various curves of the falling wave, then the breaking foam, the sweeps of foam on the wet sand, the reflected sky on the wet sand, the dry sand with the left seaweed in curves along the shore, and the reflected light of the sky in the trough of the sea. But we must not omit the streaks and marblings of foam from wave to wave back into the sea, for we should be accused of missing a point in our diagram. The quality of colour does not much matter, for the sea is green to-day and grey to-morrow, and being an elaborate and conscientious worker, we must strike the balance for the sake of so-called realism. Now I defy anyone to show any picture by Turner, or any other master, with any of these surface truths so carefully and conscientiously diagrammed as we can find any day in our modern picture exhibitions. As far as the noting down of facts goes, modern works are true, but with truths seen by the ordinary eye. The deeper realisms of colour, infinity, harmony, accident, and impression are absent; in fact, all are absent which go to make up the work of a gifted and instructive painter. This realistic work, falsely called, is greatly encouraged by most figure and still-life painters, some of whom have produced several examples of excellence in this sense. If the landscape-painter is to paint still life (as all figure-painters must, whether the subject be ideal or not) each and every object must be painted on the spot, and under a steady and never-shifting light, what is called a "north light." To do this out of doors, the artist must be shielded against the weather and the blinding glare of the sun, for he cannot, of course, have his steady north light and other creature comforts in the open. He finds, too, that cloud effects change so rapidly, and the cloud shadows keep chasing one another on the hills and uplands, and, unlike the lay figure, will not stay to be painted. Even the sun's light is markedly changing every hour, and that bewitching rain-cloud which has just wet him to the skin, and with the violence of its accompanying wind has nearly blown him and his paraphernalia over the precipice, remorselessly scuds away beyond the hills, and laughs at him in his misfortune. Well, it perhaps does not much matter, for the still-life part is nowadays, after all the picture; distance, mid-distance, aerial perspective, and grand landscape are not wanted—a rub in like flat door painting will do for that. The ordinary seeing eye only demands surface realism of lumps in a foreground, distemper and thick impasto work, which gives effect and is seen from half a dozen yards off.

But mark me, even on his own ground the mapper has his difficulties, for, with all his mechanical labour, even he can only take away about a thousandth part of what he sees. He cannot paint every blade of grass or every leaf on the commonest furze bush; so his so-called realism is after all but an impression which gives us counted atoms against countless infinity. Turner's foregrounds and those of the greatest masters were always subordinate to the distance or space in their landscapes, for aerial perspective, or sense of breathing power, was always in their minds. They lead you by charming gradation silently into their pictures, and bring you back again through the vaulted sky.

It is not for me to say that our modern scientific work is wrong. I can only point out to you as clearly as I can that the present tendency of the school is a contradiction to the whole range of art as practised by the masters of all time, including our own gone by;

and, what is more, Turner himself practised that art during the greater portion of his long life, and in his latest works he was so unlike the present realists that not one in 100,000 can tell his real work from a daub. Personally, I consider that Turner's finest works were produced in his middle life, and those eccentricities of his later life were dreamy impressions of an exhausted intellect. In his vigour he painted on the lines of the masters in whose works both in figure and landscape he was deeply learned. He produced all his pictures in his studio, and not direct from nature, and, as I have before stated, *his* realistic work was not made up of surface truths, but of qualities of light and harmonies of colours which he saw in nature under certain effects, and which he painted as his own ideal founded on the real.

The word conventional is a common word applied to the "exploded art"; and here, again, Turner must have been sadly wrong, for no man painted on the rules of art so religiously as he. He painted more classical compositions than any man, and never produced even a small work for book illustration that was not composed according to the highest rules of landscape art. Further, in the practice of these rules, he not only equalled all the old masters, but, after having thoroughly acquired them and mastered them, he superadded his own, but still *always* on "conventional" lines. Turner indeed so admired Claude, Poussin, and many others, that he painted in their manner; and after firmly refusing enormous sums for some of his best works, he left them to the nation, on the condition that some of them should be hung between the Claudes. If this does not express his feeling for the great dead masters, I wonder what would?

But is the "conventional" or formula art really what is said of it? I presume that landscapes with temples, classical buildings, lakes, and trees still exist in classic lands. Indeed, we all know they do. Surely, then, we now and again may have a classical picture, and not everlastingly be obliged to have hedgerows and uplands peculiar only to English scenery? Suppose, however, for argument's sake, we admit the formal and artificial look of one of those temple subjects, do the laws of nature not extend to them as to other subjects? Surely Claude and Turner and others painted in those pictures light and space, and fine colours and luminous shade, and strength and gradation, and absence of paintiness—this last quality being, perhaps, the most subtle of all the realisms. The so-called "conventionalism" is, then, after all simply a matter for objection on the ground that great artistic intellects have by instinct "balanced" their pictures by harmonious and contrastive lines, and arranged them into lovely harmonies of colour and masses of light and shade. The offence is, in a word, that the laws—for they are laws—which governed the minds of those gifted men are to be cast to the dogs because a certain number of ordinary minds take objection to them. Thank God, those laws are just as unerring, however, as those of the great architects, poets, musicians, and fine art designers. They have, in truth, no fashion and no change, and are made for all time.

Literary critics, headed by the greatest, have for some years denounced the old masters' art by every opprobrious epithet they could think of; I refer, of course, to landscape art. If these attacks be warranted, then the art in question is the most singular and marked exception to every other branch of fine art, including poetry and science, which has ever been produced. I venture humbly to ask whether such sweeping denunciations would apply to the ancient or mediæval poetry, to the ancient sculpture, to the great classic and mediæval architecture, to the figure painters of Italy, Venice, Holland, and Spain; to Benvenuto Cellini, Luca della Robbia; to the artistic ceramic wares and fabrics of the sixteenth century; to Albert Durer's and Rembrandt's etchings; to Persian and Oriental carpets and porcelain; and to the great metal-workers and artistic designers of ancient and mediæval times? Those sweeping denunciations are only applied to the unfortunate "diseased" masters in landscape. What a wondrous exception to be sure!

How passing strange that among so many great masters in figure there should have been none in landscape! As if, among a host of gifted musicians, there were skilled players on every possible instrument but one, and that one a leading instrument. This is too absurd, and grotesquely so, when we know that Gainsborough, Wilson, Turner, Constable, Crome, Cox, Dewint, and all our greatest painters thought otherwise. Which side, then, are we to take, supposing even we knew nothing of art—the side of a great poetic prose writer and his satellites, or that side which includes the names of all the greatest painters in landscape of the whole world? Which, I wonder, ought by God's gift to be the best judges in such a case—those in literature or those in art?

In figure-painting, as a whole, our English school has ever been much behind the ancient masters, for those masters nearly always combined fine colour with trained draughtsmanship, and until recent years the facilities for obtaining this careful discipline existed only in London, Dublin, and Edinburgh. But the art of painting is what we want, and in my opinion there has only been one branch of art ever thoroughly taught in England, and that has now disappeared—I mean the art of painting landscape in water-colours. The greatest of all the masters taught it for a living; and this our highest English art, taking it collectively, is the only branch which has ever been taught by masters. This may seem

a startling statement, but it is a true one; drawing is taught everywhere, but not painting by masters. Art schools have now taken the place of the masters I speak of, and it is certain that the outcome of such teaching will speedily show itself. If a master at a school be a painter, his pupils will of course be influenced by his work and teaching; if he be not gifted, the school ought at least to have good examples of work, chiefly progressive, for the benefit of the students. If the teachers and students do not know the true art and its practice, how is it possible for the outside public to know? The people may be pleasingly interested and amused in pictorial scenes of battles, hunting subjects, sensational and dramatic pictures from history or domestic life; but that does not necessarily include the fine art of painting.

Let them not be satisfied merely with the names of the great men, or be contented with saying this or that is considered a fine work; let them at least make an effort to know why. And should opportunities of doing so be denied them, let them, as with poets, musicians, and scientists, take in faith what is given them by those whose knowledge and judgment are beyond question. My venerable friend and art master told me a few days ago that one evening—years ago, of course—when he was at Sir Martin Shee's, he heard Turner make this memorable statement: "He who knows most of art will best know how to treat nature." Let these words, ladies and gentlemen, be engraven on our minds, for upon them rests the true art of the painter.

A word or two on so-called high art, and on water-colour painting, and I have done. By the term high art we are generally led to look for some grand theme, both as to size and subject. England, one of the nations of colourists, and the greatest nation of landscape painters, it is said, has rarely, if ever, produced high art painters. If this means exclusively works of mythology and religion *in extenso*, then perhaps this nation has not produced much high art. If, however, it means works of various subjects *in intenso*, England has produced many painters of high art. To paint a grand mythological or religious subject of life-size figures on a 40-foot canvas surely cannot be called high art, unless it be painted by a colourist, a draughtsman, and great composer. Were not Hogarth, Reynolds, Gainsborough, Wilkie, Etty, Turner, Cox, Dewint, and a host of others, painters *in intenso*, and therefore painters of high art? Hogarth, satirist and painter, was scoffed at for painting low art subjects, but is he not nevertheless known as a painter of men and morals of his period, not only as a colourist and artist, but as a satirist of the rarest class? Is it not generally acknowledged that Reynolds has had no equal as a painter of women and children, and that he had a sympathy for his subject peculiarly his own? Wilkie, again, is he not admitted to be the greatest and most graceful and refined painter of domestic *genre* pictures in the world? Landseer was poet and painter both. The *Shepherd's Chief Mourner*, *The Sanctuary*, and *The Random Shot* are his. Turner, we all admit. Cox, the simple and unaffected painter of everyday nature, the Burns of his art, the poet pastoral of landscape art, was he not *in intenso*? He painted nature as God gives it us; intense realism for those who can, as Carlyle says, "see," and a poet withal. William Hunt, the primrose and ploughboy painter, the "vulgar" artist, as he was so often called by the veneered men—yes, he painted humble people and humble subjects as no man need ever again hope to do. It is not too much to say that in his branch of art there probably never has been anything more intense (to those who can "see") than the works of this gifted master. Is *The Blessing* (which I have brought for you to see) vulgar and common art? Was there ever anything finer in its way? Is not the glow of health and rich reflected light in *The Pitcher-Girl* as fine as Titian. Did not Burns write on rustic subjects: "The Cotter's Saturday Night"; "Twa Dogs"; "Tam o' Shanter"; and the "Ode to Mary in Heaven"? Are they not *in intenso*? To quote again from Carlyle, for which I have a fancy: "You would think it strange if I called Burns the most gifted British soul we have had in all that century of his; and yet I believe the day is coming when there will be little danger in saying so." William Hunt, then, was a man emphatically *in intenso*, for his work to those who know is perfect. Never mind the subject of that spray of greengages, but let any one skilled in the finest art imagine any discourse on colour and sympathetic manipulation more searching and wondrous than this. For I contend that the poetry in true art is by no means limited to what can be described in words or translated by an engraver. No, the poetry of which I speak is inherent, and cannot be described or translated any more than the finest tones in music. Examine that vase of flowers. Nature speaks to you. It is so full of nature's glories that nothing can surpass it—not even another Hunt. A thousand men can paint those humble things, and a thousand can write upon them—but how? Not like Hunt, or Burns in his "Mountain Daisy." *The Blessing* has each and all of Hunt's qualities, and I believe no finer head has ever been painted. The expression, however, is at once felt by all; and this makes it a poem. No, it is only part of the poem, and that part which gives popular interest to the picture; but it can be translated in engraving or photography—words also may convey something of the beautiful expression—but the vital art of poetry is in its colour and artistic power, and, like the *Portrait of Philip IV.* by Velasquez in our National Gallery, like Turner, Cox, and

Dewint, and indeed all great painters, it remains in the work alone. What is high art if this is not?

Mr. Ruskin speaks of *The Shy Sitter* and *The Blessing* in the following impressive and poetic words: "They were things that the old painter was himself unspeakably blessed in having power to do. The strength of all lovely human life is in them; and England herself lives only, at this hour, in so much as, from all that is sunk in the luxury, sick in the penury, and polluted in the sin of her great cities, heaven has yet hidden for her old men and children such as these, by their fifties in her fields and on her shores, and fed them with bread and water."

A word on water-colour painting. This lovely branch of art may be said to be indigenous to this country; it was born and fostered here, and it culminated in the works of some of the greatest of all landscape painters who were Englishmen. It has been called the "Cinderella" of English art, for it has been so despised and neglected that it is the only branch of fine art which the Royal Academy has not honoured with a diploma. Perhaps the reason is because of its beauty and originality. It has always been overshadowed by its proud sisters, but our neighbours across the Channel and our cousins across the Atlantic have always freely admitted (while denying the existence of our school in oil) that we were absolutely alone in water-colour painting. It may, however, come about that one day our poor "Cinderella" shall be found worthy to ride in the coach-and-six, and have the crystal slipper. One would think from this slight that no great painters ever worked in water-colours. Who then were the painters in this medium? Some of England's greatest artists, whose names are known wherever the English language is spoken. Turner was one of them, and what seems strange, and to many incredible, his genius culminated in his water-colour drawings. Mr. Ruskin's celebrated *Modern Painters* would have lost much of its searching fire without Turner's water-colours, for he continually refers for his illustrations of phenomena in skies, mountains, rivers, trees, and atmospheric effects to those matchless works. It is not too much to say that Turner's peculiar individuality expressed itself in his water-colours, and this doubtless on account of the purity of colour and flexibility of the medium. He was, moreover, so enamoured of its qualities that he tried his utmost to produce its transparency and tenderness in oil, and in doing this his genius in oil reached its zenith. Turner for a few years before his decline expressed his singular individuality in this mode of work in oil, which can plainly be seen in *The Regatta at Cowes*, *the Yarmouth*, and *Line Fishing off Hastings* at South Kensington Museum. But perhaps his finest are the *Van Tromp*, *Romeo and Juliet*, and above all, *Ulysses and Polyphemus* in the National Gallery.

David Cox painted chiefly in water-colours, and he, too, when he painted in oil, produced the purest and loveliest works ever seen in pastoral art. His water-colours, however, are without rival; and, for my part, I have never seen any oil picture by any master which could live for a moment with his grand drawing of the *Vale of Clwyd*. It is simply dazzling with light in sky and landscape, and more powerful in shade than any oil picture whatever. Peter Dewint, the colourist *par excellence*, was chiefly a painter in water-colours, and he, too, when he painted in oil, was as fine as the finest. Let anyone accept as proof those two grand oil pictures in South Kensington Museum. *The Cornfield* is, perhaps, one of the finest pictures in the world. George Barret, who was starved, also painted in water-colours and sometimes grandly in oil. Girtin, Bonington, Prout, Holland, Fielding, Hunt, and a host of others might be added to the list.

I would conclude this long lecture with an ardent desire that those among us who love the elevating and refining art of painting would consider it as one of the signs of a high civilisation, and that it means much more than a pleasing and fashionable pastime. Above all things I would urge upon you the study of the true or high art, which can only be found in the works of the greatest masters, no matter what may be the theme. Literature, the most powerful of all mental medicines, may, if wisely applied, serve to direct the reading public to that which is true or false in art; but the only genuine books are those which have been bequeathed to us by the masters; and they always have been, and always must be, the only sure books of instruction, coupled with the study of nature. To those who can read the masters' works no literary instruction is needed, for the great ones had no such help when they produced their works.

Let the knowledge in art, then, as in other things, be tested by the power of appreciating the works themselves. We may be sure also that the great man, be he poet, scientist, painter, musician, or distinguished in any branch of learning whatever, whose works have stood the test of centuries, is not to be thrust aside by a passing fashion, however powerful, and Hood's lines on the true and false poets fall with equal force on the true and false painters:—

For few there be who pipe so sweet and loud
Their voices reach us through the lapse of space;
The noisy day is deafen'd by a crowd
Of undistinguished birds, a twittering race;
But lark and nightingale forlorn
Fill up the silences of night and morn.

Hood's "False and True Poets."

NOTES AND COMMENTS.

WE understand that the Government have offered 500*l.* to each of the five competitors who took part in the second competition for the Dublin Museum, that sum being in addition to the 150*l.* to which they were already entitled. It seems to us that the amount of compensation is far too small. In spite of the assertions of the Secretary of the Treasury, it was stipulated that one of the five architects was to have the carrying out of the building, and even the tenth clause of the second set of conditions, which has been referred to by Mr. COURTNEY, cannot be interpreted as being against such a selection. In ordinary cases the five architects would have fair grounds for separate actions to compel the execution of the conditions; but with the Treasury for a defendant equity might not prevail. The Government should, however, remember their obligations, and they ought to act with as much fairness as would be expected in private individuals. A thousand pounds is the lowest sum that the competitors may reasonably expect as a solatium.

It would have been better if the claims of the five competitors had been settled before the new competition had been announced. So far as can be judged, it will be on the same lines as those which have given rise to so much annoyance and disappointment. There are, as before, to be two contests. First, a general one, open to all who care to undergo the expense of preparing designs, and secondly, a select one. The committee will be appointed by the Treasury, and is to include an architect, who is to be without personal interest in the competition. The site that is to be dealt with will be of much larger area, but the sum to be expended on the erection of the new museum and library, with a lecture theatre, laboratories, and offices, for the Dublin Society, has yet to be fixed.

ACCORDING to the *Courrier de l'Art*, it is intended to establish in Paris a yearly international exhibition of the works of eminent painters of all countries, and in order that a high character may be sustained, the number of artists represented will not exceed twelve. The committee includes the names of Lord LYONS, the English Ambassador, Sir FREDERICK LEIGHTON, P.R.A., Sir RICHARD WALLACE, Sir PHILIP CUNLIFFE OWEN, Mr. JOHNSON, the director of the Metropolitan Museum, New York, Mr. W. H. STEWART, and Mr. W. W. CORCORAN, the founder of the Corcoran Gallery, Washington. There have been attempts at holding international exhibitions in Paris, but they can hardly be considered successful. They were, we believe, supposed to be private speculations, and the owners of pictures and artists were indisposed to run the risk of sending examples. But the new project stands on a different footing. It would be an advantage to students and artists to be able to compare good examples of the contemporary art of Europe. Germany appears to be excluded from the committee, but probably there may be no objection hereafter to the reception of works from Dusseldorf and Berlin.

AN invention by Mr. SUVERKROP, C.E., an American engineer, was brought under the notice of the Scottish Society of Arts on Monday evening. The instrument is proposed to be used for ruling parallel, straight, and circular lines, and producing line-tints. It is said to be simple in construction, and lines varying from 1 inch to the 140th part of an inch in distance from one another can be readily drawn by it. Waved or zigzag lines, and circular lines of varied radii, may also be drawn; and it was stated that the apparatus had been found to be of great utility in shading skies and backgrounds of architectural and other drawings. The drawback to an instrument of the kind is that it may be applied to the production of what are supposed to be "artistic effects." Mechanical appliances can only be expected to produce mechanical results. Of course a clever artist would be able to utilise a ruling-machine, and the blocks in periodicals by American draughtsmen which are partly machine-work are undoubtedly effective. But in the hands of men who are deficient in artistic ability machine-ruled shadows, clouds, and foregrounds are not likely to be gratifying.

Mr. JAMES FERGUSSON proposes that the model of the equestrian statue of the Duke of WELLINGTON which the late ALFRED STEVENS prepared for the monument in St. Paul's, and which is now in the crypt of the cathedral, should be

completed and placed in the position for which it was designed. The expense, it is said, would not exceed 200*l.* "If this were done," says Mr. FERGUSSON, "the public would then be in a position to judge of what really was intended to be the effect of the monument as designed by Mr. STEVENS. If it was a success, surely the 1,000*l.* or 1,500*l.* could be found to cast it in bronze and place it in position; while if the effect is not pleasing, it could easily be knocked away, and an urn or some sort of funereal trophy be substituted. Anything would be better than leaving the monument in the truncated and unfinished state in which it at present stands." The equestrian statue was rejected because in his old age Dean MILMAN was ambitious to be thought a funny fellow, and in that character made a poor joke about the Duke riding in on the top of the monument, which of course the cathedral dignitaries applauded. It is remarkable that not even at South Kensington is the monument to be seen reproduced as it was designed. The flat table that at present completes the work suggests the need of something else; but however much we may respect Mr. FERGUSSON's opinion, it would be better to leave the monument as it is than to stick an urn on the top. There are too many urns already in English buildings.

COUNSELS' opinion has been obtained by the Committee of the National Society for Preserving the Memorials of the Dead in respect to the control possessed by incumbents and others over monuments. Mr. DODD says that it is not usual or necessary to obtain a faculty for the ordinary monument or tombstone; the consent of the incumbent is sufficient. But monuments cannot be removed without a faculty, otherwise the incumbent is liable for damages in both secular and spiritual courts. It does not matter under what title the monuments were introduced. If it were supposed that monuments erected without faculty were not under legal protection, they would be at the mercy of every incumbent. The clergy have not always acted on this theory of the law, and there are many cases in which they have acted rightly in disregarding it. At one time it was common to gratify the vanity of people by allowing memorials of their friends to be placed in most prominent positions without regard to the appearance of the church. In London there are many examples. The interest in the epitaphs of the majority of these has long ceased, and there is no reason why the tablets—which are generally hideous in appearance—should be allowed to remain. The Old Mortality Society will be wise if it does not expend its energies in the maintenance of things which are only incumbrances.

THE spire of the Rochdale Town Hall, which was 134 feet high, has been destroyed by fire. The origin is unknown, but the fire, as often happens, came in contact with gas that was escaping, and in a couple of hours the whole of the timber was either consumed or had fallen into the building below. The stone tower is apparently uninjured, and the damage to the large hall, grand staircase, council room, and mayor's parlour is less than might be anticipated. The entire building would probably be now a ruin if it were not for the precaution of the clerk of works, who, when he discovered there was a leakage of gas, kept watchmen on guard by night as well as day.

THE Mitchell Library in Glasgow surpasses all other public libraries in Great Britain in the completeness with which modern periodical literature is represented. There is hardly a newspaper, magazine, or other serial, which is likely to be interesting, that is absent from the reading-room, and the library is available to the humblest inhabitant of Glasgow. Unfortunately, the building in which the library is contained is inadequate in area. But it is difficult to secure a better site, although it is known that within the last few years some valuable private libraries would have been bequeathed to the city if the owners were satisfied that the books were likely to be properly housed.

AT the meeting of the Institute of Architects which was held on Monday, it was resolved that it be referred to the Council to consider in what manner the claims of the Architects' Benevolent Society can be brought prominently and effectually before the profession. Afterwards it was resolved that the revised paper entitled "Suggestions for the Conduct of Architectural Competitions," presented to the last business meeting, be adopted.

THE KENDRAY WING,
BOSTON DISTRICT COURT.

PREMIATED DESIGN FOR M

By MARK J. L

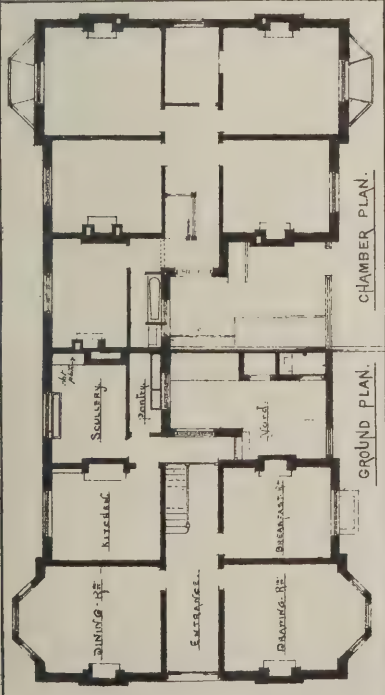

April 14th 1883.

Designed and drawn by
Mark Fox Rendell 1882

INFIRMARY AT HASTINGS.

DELL. A. R. I. B. A.

VILLAS, HOOLE, CHESTER.
For CHARLES BROWN ESQ^{RE}

C. A. EWING, Architect
CHESTER.

PHOTO-LITHO SPRAGUE & CO. LONDON.

ILLUSTRATIONS.

DESIGN FOR THE HASTINGS INFIRMARY.

THE illustration is a reproduction of the design by Mr. LANSDELL, A.R.I.B.A., of 48 Theobald's Road, W.C., to which the second premium was awarded in the late competition.

THE KENDRAY WING-BECKETT DISPENSARY, BARNSELY.

THIS illustration is taken from a water-colour drawing by Mr. R. PHÉNÉ SPIERS, representing the new wing which has just been added to the Beckett Dispensary. It is intended to serve for medical cases as apart from the old building, which has generally been devoted to surgical cases. There is a provision for eighteen beds on each floor, the women's ward occupying the first floor. The new wing has been built on the west side of the hospital, on a site lately acquired by the trustees. As the kitchen and offices of the existing Beckett Dispensary are sufficiently large to serve both buildings, the administrative block contains only nurses' rooms, sculleries, and bath-rooms. The new block has been named the Kendray Wing, after the lady who has so generously contributed the large sum of 2,000*l.* towards its erection in memory of her connection with the town. The donor is the surviving daughter of the late Mr. FRANCIS KENDRAY, of Barnsley, and the wife of Mr. EDWARD LAMBERT, of 28 York Terrace, Regent's Park, London. The works have been carried out by Messrs. NICHOLSON & SONS, of Leeds, from the designs and under the superintendence of the architect, Mr. R. PHÉNÉ SPIERS, F.S.A., Carlton Chambers, 12 Regent Street, London.

VILLAS, CHESTER.

THESE villas were built lately for Mr. CHARLES BROWN, Mayor of Chester. The materials used are Ruabon pressed bricks for the walls, with Manley stone for heads, sills, strings, &c., the roof being covered with picked Westmoreland green slates; the joiners' work throughout is of selected pitch pine, varnished.

Mr. THOMAS HUGHES, of Aldford, was the builder; and they have been carried out from the plans, and under the superintendence, of Mr. C. A. EWING, architect, Chester.

STUDIES FOR DRAPERY, BY M. LECHEVALIER CHEVIGNARD.

EDINBURGH ARCHITECTURAL ASSOCIATION

ON Saturday about fifty members visited the interesting Collegiate Church at Seton. The features of the structure were fully described in a paper prepared by Mr. Hippolyte J. Blanc, architect, Edinburgh, and its detail compared with similar work existing in various parts of Scotland. The edifice was afterwards carefully examined. The company next proceeded to the ruin of Preston Tower. The keep of an ancient fortalice, its origin is involved in obscurity, but Sir Walter Scott supposed it to have been an outpost of the Earl of Home in those remote times when that family ruled with princely authority over the whole south-eastern district of Scotland. The castle to which this keep belonged was burned by the Earl of Hertford in 1544, and again in 1650 by Oliver Cromwell, after the battle of Dunbar. Preston Cross, an interesting erection in the immediate neighbourhood, said to have been acquired by the Chapmen of the Lothians in 1636, and recognised by their descendants still as a centre of merry-making and interchange of salutations every year on July 1, was carefully studied, and its features described; after which the mansions of Hamilton and Northfield, close by, were visited. Leaves from the Edinburgh Architectural Association Sketch-book bearing detailed illustrations of all the structures visited were brought forward for reference at each respective subject.

The Society of Graphic Arts in Vienna have arranged to hold an international special exhibition of the graphic arts. It is intended to show the development of the graphic arts during the second half of this century in Europe and America. The exhibition will be opened on September 15 and closed on November 1, and will consist of (a) engravings of all kinds; (b) etchings; (c) lithography; (d) woodcuts; (e) drawings of all kinds prepared for reproduction by one of the graphic arts; (f) permanent photography, heliogravure, illustrated books, &c. The prizes, awarded by an international jury, will consist of gold medals and diplomas.

ITALY FROM AN ARCHITECTURAL POINT OF VIEW.*

By F. T. BAGGALLAY.

I FEEL that I have been more than a little rash in choosing for my subject this evening one so comprehensive and so much better understood by some of you than by me. My apology must be that I feel more or less enthusiastic in the matter, and that, even if I fail to say anything which will be new to the old travellers, I may at least hope to interest some of my fellow-students who have not yet had the good fortune to visit Italy, in the architecture of that country, which held the foremost place in art and literature for several centuries of the world's history.

In the spring of 1880 I had an opportunity of travelling abroad for a short time for the sake of study, and of course I was recommended to go to Italy. It was the right thing for a young architect to do; every one did go there, and I was certain to enjoy it. But for a long time, in my usual pig-headed way, I declined to entertain the idea. I was a narrow-minded Goth, and would not look at anything without pinnacles and pointed arches; as to a flying buttress, I loved it as my friend and brother. My views of Italian architecture were not very broad, and by no means flattering; they were gathered principally from such books as Letarouilly and Cicognara, and I think concentrated themselves in a vision of Corinthian columns, as numerous and infinitely more monotonous than the trunks in a pine forest, sprouting at the top into marble acanthus leaves of the most irritating sameness. However, knowing very well that I knew nothing really about the matter, I at last allowed myself to be persuaded into going, and one wet and dreary evening in April I found myself, after a long and tiring journey, in the train running down the wild valley of the Dora from the Mont Cenis Tunnel towards Turin. This valley is described in the guide-books as picturesque and lovely; but that evening, in the wind and rain, and tired as I was, it appeared to me the very impersonation of weird and fantastic desolation—the sort of place, as some one said, for which Gustave Doré must have got out the working drawings. He might have added that Dante should have been employed to write the specification. The few drenched passengers at the stations, with their slouched hats and cloaks thrown over the shoulder, appeared like so many Guy Fawkes or stage villains dissembling. The fact is, I had made up my mind to make the worst of everything. It rained incessantly for the first three days I was in the country, and I talked sarcastically about blue Italian skies; it was bitterly cold, and I wrote home ironically about “the sunny south.” The paper money, the noisy streets, the importunate beggars, and the pestilential guides were excellent food for my ill-temper; while the buildings of Turin, where I was staying, were not calculated to dispel my illusions with regard to Italian architecture. Altogether I was decidedly not happy. However, after these first three days matters began to mend; the rain ceased, and we had a cloudless sky all the summer through; the temperature became warm, and sometimes something more; and from the time I went to Pompeii, which I did at once, while it was still spring and reasonably cool, I began to get enthusiastic in my studies.

I do not propose to weary you by acting the showman, and telling you, in guide-book fashion, that in such-and-such a town this and that building have certain features of interest, and that they were built by So-and-so, and restored by somebody else, neither of whom you may have heard of, but rather to attempt some short description of those features which made most impression upon me as being peculiar or peculiarly treated, and you will, I hope, not think me presumptuous if I add a few opinions and criticisms upon what I describe. In the fear of failing to interest you by what I have to say, I have borrowed from my friends a number of sketches and drawings of Italian architecture, which are hung upon the walls, and for the loan of which I desire to convey my best thanks to Mr. Millard, Mr. Vacher, Mr. Stokes, Mr. Hooper, Mr. Conder, and Mr. Leach.

I may say at once that my vision of Corinthian columns quickly faded. There is in Italy a mass of Mediæval work which, whatever its faults—and they are many, at least, from our standpoint of constructional truth—must excite the deepest admiration.

Shams: want of Thought in Design.

There is much of what we should call shams and constructive absurdities, and there is an evident lack of thought and ingenuity in much of the designing (I speak of the Mediæval work only); but these things were apparently not held to be faults, or more probably were altogether unnoticed at the time; and there is so much native grace and dignity of outline, and such beauty of colour, and, above all, such variety and suggestiveness, that one feels bound to forgive even such grave and fundamental errors.

Want of Continuity in Style.

One of the first things with regard to Italian architecture that I observed in going from place to place was its independence. There seems only a very slight connection, except in a few matters

* A paper read at a meeting of the Architectural Association on the 6th inst.

and in exceptional cases, between the style in vogue in one town or group of towns and that of another; even the continuity of its history in one place is often most difficult to understand, designs springing up constantly, founded to all appearance upon nothing that has gone before and contemptuously indifferent to precedent, that tyrannical pedagogue before whom we all bow and tremble.

What apparent similarity is there, for instance, at first sight, between St. Ambrogio at Milan and St. Zeno at Verona, both buildings of the twelfth century; or between St. Miniato at Florence and Lucca Cathedral, separated only by fifty years in time and by less than forty miles in distance? Or where is the evident connection between the gorgeous façades of Orvieto and Siena cathedrals and any previous or contemporary buildings? Of course, I do not mean that no connection exists, but only that the course followed by the designers was so independent that some research is required to find it, and great difficulty would be experienced by anyone who attempted to classify the architecture of Italy by dividing it into periods, as we have done with our own and with that of France; indeed, to do so would, I believe, be found impossible.

Low Roofs.

The thing of all others which, on entering Italy, is most certain to arrest the attention of every architect from this side of the Alps is the low pitch of the roofs. The reasons for this have been so often detailed that it is not necessary to repeat them again; but it has such an important influence on much of the designing that I cannot help referring to it. The first and most important consequence is that the roof becomes an entirely unimportant feature externally, even if it is seen at all; for a very flat-pitched roof does not, of course, appear in perspective. When you think of the sky lines and other picturesque effects of the high roofs and gables of France and Germany, and what an important service the long level ridges and flat surfaces of the roofs of our English cathedrals perform in giving repose and finish to the designs, you will perceive at once what a difference this alone must introduce. Then, again, low roofs mean low-pitched gables, and these, almost as a natural consequence, necessitate the horizontal treatment, which is everywhere noticeable, rather than a vertical one, and so assist in maintaining the classical traditions of the country.

Lack of Vertical Connection.

To this dominant horizontality (if I may call it so) is due, I think, the fact that Italian architects, while evidently very particular about the lateral continuity of their designs, seldom seem to have thought it necessary to provide any vertical connection between the parts, so that buildings frequently give one the impression that they have been erected in separate storeys or features, which were afterwards piled upon one another.

Absence of Buttresses.

Another thing that strikes the English architect most forcibly in Italy, notwithstanding all he may have heard about it beforehand, is the absence of buttresses. An Italian never used a buttress if by any possibility he could avoid it. If it was necessary to resist the thrust of an arch, he considered that the natural and legitimate thing to do was to put in an iron tie-rod, and he did so with the greatest frankness, and without the least sense of shame or of its being in any way reprehensible. So much has been said upon the merits and demerits of the two systems, that I will only remark, that while one leads to picturesqueness and piquancy the other lends itself to refinement and repose. It is certain that buttresses would so alter many of the most beautiful features of Italian architecture that they would no longer be themselves in any sense whatever. How would it be possible, for instance, to construct with buttresses anything at all resembling the beautiful porches attached to almost every cathedral and important church of the Romanesque period in Lombardy, which I shall presently describe?—or the tomb canopies of Verona and Bologna, one of the principal charms of which is their simple outline? Or how would Italian campanili look with buttresses? Perhaps they might still be beautiful in another way, but they would no longer be Italian campanili.

Arches.

A noticeable point in all the more nearly Gothic of Italian Gothic work—that which is evidently founded to some extent on Northern buildings—for instance, to give the best known examples, Florence, Orvieto, and Siena cathedrals—is that the arch mouldings are invariably, I believe, a repetition of those on the jambs, the caps being treated simply as an impost. I must say that I do not see the horrible wickedness of this arrangement, so often held up to reprobation by the virtuous apostles of architectural propriety. The caps have only a slight projection, and are so much run together that they may well be regarded as simply a band of carving marking the change from a straight line to a curve in the lines of the jamb; and as to the mouldings being the same, why, we do it ourselves every day. Where the arches are stilted, as they often are, the real springing is marked, with much true artistic feeling, by a small subordinate moulding, which, often too, forms a kind of base or plinth to the mouldings of the arch. I must not omit to mention the form of pointed arch, peculiar to the civil buildings of Florence and Siena, and a few other places to

which the style extended, which grows thicker towards the apex, that is, has the back of the arch more pointed than the soffit. This form strikes me as having an exceedingly pleasing effect; how much of the pleasure is due to the novelty I am not quite sure, but I do not think much. It has been condemned as unscientific, but of that I am not convinced, for I think it must bring the thrust more perpendicularly upon the abutments. Even if it is unscientific, must we always sacrifice beauty to constructive truth? And had we not better, in that case, become civil engineers at once?

Colour.

One prominent characteristic of Italian architecture—perhaps the most prominent; one certainly which strikes any traveller from this drab and dingy city as much as any—is the prevalence of beautiful and brilliant colour, both outside and inside the buildings. The climate is, no doubt, mostly responsible for this; the strong lights and deep shadows make brilliant colours, which here look glaring and vulgar, both bearable and pleasant. Perhaps, also, the artistic instincts of the population have something to do with it; and the purity of the atmosphere makes it possible to expose even fresco paintings in the open air. Coloured marble, too, is comparatively easily obtained and cheap, and is largely used in important works, both in large pieces and in mosaics. But the Italians use also materials for external colouring which are equally accessible to us, and which are, indeed, being gradually introduced; though not to such an extent as they might be, did some of us exhibit but a little more energy and enterprise, and perhaps a little less wilful prejudice. I speak of terra-cotta, ceramic ware, and glass mosaics. Before I went to Italy I was strongly prejudiced against the two first of these, but I feel sure that no one could retain any such prejudice after seeing the terra-cotta work at Ferrara, Bologna, Pavia, and other towns in the North of Italy, and the glorious panels and friezes of Della Robbia ware at Florence and elsewhere.

Terra-cotta.

The most refined work in terra-cotta is, I think, to be found at Ferrara, with cinque-cento details, but there are also a mass of very beautiful things at Bologna, and the cloisters of the Certosa of Pavia seem hard to beat when one is looking at them. I have sometimes heard it urged that terra-cotta, being a cast material, leads to flatness by the avoidance of undercutting, and to lack of interest by the repetition of features. Of course, it may be so, but the Italians do not seem to have fallen into either trap; their terra-cotta work is full of vigour—sometimes, as in the Ospedale Maggiore, at Milan, too much so, I think; and the more important features are seldom or never repeated, but are undercut and modelled like features in stone or marble, the mould being then necessarily broken in the production of the first cast. Among all the beautiful busts and heads in the cloisters of the Certosa, I believe I am right in saying that no two are alike. The features required to be repeated cannot, of course, be undercut, but they are usually elaborately carved with running ornaments, only a few fillets being left plain. This has two advantages; it prevents the unavoidable flatness of the mouldings being noticed, and it hides, to a great extent, the imperfection of the joints caused by the unequal shrinkage of the material.

Ceramics.

The ceramic or majolica ware, to which I have referred, is glazed and coloured, and belongs to the latter half of the fifteenth century. The colours are mostly blue, green, purple, and yellow. Wherever it appears it is always attributed to Lucca della Robbia, or some member of his family, and I have never heard any doubt cast upon its origin; but, if the family had a monopoly of the manufacture, I think it must have been a valuable one, for there are now specimens of it all over the world; there are several at South Kensington. It is often used internally, as well as on the outside of buildings; but is, I think properly, confined, with few exceptions, to decorative friezes and panels. (The most noticeable exception is the front of the Oratorio of St. Bernadino at Perugia.) It always has a good effect, especially when the colouring is confined to a flat ground from which the white figures stand out in relief, the simplicity being eminently decorative. It is used with particularly beautiful effect in the coffers of the central arch of the porch of the cathedral at Pistoja and in the circular coffers—I do not know whether that term is correct, but I think it will explain what I mean—of the beautiful little dome over the porch of the Capella Pazzi at Sta. Croce at Florence.

Banded Striped Work.

It would not do to leave the subject of external colouring without mentioning the striped work both in white and dark green (practically black) marble, and in white marble or stone and red brick. It has occasionally an irritatingly unquiet effect, and I am sometimes a little inclined to think of zebras in connection with it; but, on the whole, I think most people are pleased with it, and it certainly gives interest to many an otherwise flat wall surface. The bands are of course always horizontal, but there seems no rule to regulate their depth. Sometimes the black and white are about equal, as at St. Lorenzo at Genoa and the cathedral at Orvieto. The interior of Siena Cathedral, one of the most impres-

sive interiors I know, is exactly similar. Sometimes, as in the exterior of Siena Cathedral, they are so unequal that one might call it a white wall with black strings; but usually the proportion is between the two extremes, the white being always in excess. The best example that I remember of the many buildings with red brick and white marble bands is the cathedral at Verona. The bands are about equal in breadth, and have a very fine effect; much better, I think, because a little less contrasted than the black and white.

Mosaics.

Glass mosaic was employed everywhere, almost to the exclusion—sometimes altogether to the exclusion—of other forms of decoration in the interiors of all the important early Christian churches in Italy. Those of Ravenna and Rome are covered with it, and in the tenth century even the whole of the interior of St. Mark's at Venice, from about 15 feet or 20 feet above the floor, is literally sheathed with it as if with a tight skin.

The ground colour of these mosaics is sometimes a dark rich blue, as in the interesting little building called the Mausoleum of Galla Placidia at Ravenna, but more usually it is golden. The tesserae vary in size from that of a finger-nail, or larger, to almost microscopic minuteness, and no particular care is taken about their exact form. They are always arranged in rows or lines following the contours of the objects represented, and the features, hands, and other important parts are drawn with the smaller pieces, and the groundwork and flat surfaces with the larger ones. The drawing is stiff and conventional—to put it in polite language—but, on the whole, pleasing, and perhaps more decorative in character than the highly-finished productions of a later age. The colour is magnificent in the extreme. I could never like the system adopted of running the mosaics round the arrises of arches and piers. It altogether confuses the lines of the architecture; and though some say there is much poetry in the mystery that results, it nevertheless seems to me to offend against true decorative principles. Besides, I do not see that mystery does necessarily mean poetry; there is plenty of the former, but very little of the latter, in a London fog. I should much like to try the effect of a marble moulding on the arrises the first time a client gives me an order for a mosaic-covered interior. The mosaics with which the west fronts of Siena and Orvieto cathedrals are covered, and most of those in the west front of St. Mark's, are of late date, gorgeous in colour, unconventional in treatment, and scarcely, I think, worthy of the admiration often expressed for them.

I might say much about the painted and fresco decorations both of early date at Pompeii and Rome, and the later ones at Perugia, Pisa, Florence, Assisi, Padua, and elsewhere; but they afford more than sufficient matter for a paper by themselves, and I leave them with the hope that some one will before long come forward with an essay on the subject.

Marble.

The use of marble is so important a feature in a large majority of the principal buildings of Italy that it deserves to be described at some length. Much has been said and written respecting the sham involved in casing walls, as is there almost invariably done, with marble slabs. It is done in the churches and palaces of Venice, notably at St. Mark's and the upper part of the Ducal palace. All the principal ecclesiastical buildings at Florence, the cathedral, the baptistery, the campanile, St. Miniato, Sta. Maria Novella and Sta. Croce are incrustated with white, black, and coloured marble in thin slabs, and the same is true of many churches at Pisa, Lucca, Pistoja, and, indeed, throughout the country. Milan Cathedral is an exception, it is true, in this as in other ways, and I think St. Lorenzo at Genoa, Siena and Orvieto cathedrals (all except the west fronts), and a few other buildings have really marble ashlar; but it is impossible to tell. I have rather lost faith in ashlar work, since I have seen the destruction of the old law courts at Westminster, and how the solid-looking blocks there turned out to be little better than paving stones on edge.

Even if those buildings are of solid blocks, they are only of the white and dark green marbles, so easily obtained from the neighbouring quarries in the Apennines that they may be considered as the local materials. It seems to me that it would have been absurd to use rare coloured marbles in the same way as common building stone; they are practically quite a different material, and should be treated in quite a different way; they are too valuable to be used for building solid walls with, and too beautiful to be laid so that only one small end or side of each block can be seen. As much surface, surely, should be exposed as possible, and the only way to do that is to use them in columns or in thin slabs. Some, perhaps, will say that, if marble could not be used in solid blocks, then it should not have been used at all for walling. But it would have been very hard to discard altogether the most beautiful of natural materials which are sufficiently durable for external use. I must say I think the Italians were perfectly right in resorting to the slab system; but I do not know that they often applied it in the right way. At St. Mark's, and most of the older buildings in Venice, oblong strips were laid over the whole surface, and fastened with cramps, so as to form a regular veneer, arranged like the veneering on our grand pianos and other furniture of a few years

ago, with the veining reversed to form pretty patterns. This treatment is at least honest, and has no appearance of insecurity, because the cramps are perfectly visible; but it is surely too crude and wanting in ingenuity to be a worthy solution of the problem. In most of the Florentine buildings, notably the cathedral, and in many buildings at Lucca and other Tuscan towns, the marble incrustation takes the forms of joiners' work, with styles, and rails, and panels just like a wooden door or partition. This is, of course, to be condemned; every means must be taken to avoid using the forms proper to one material when working in another. The styles and rails at once give the impression of being framed together to carry the panels; and, if you were unaware of the nature of the material, you would be quite surprised to learn that the framing was not itself the wall, but was carried by something much more solid behind it. In many buildings, in parts, for instance, of the cathedrals at Pisa and Lucca, the slabs are ranged in courses and pretend to be solid blocks. I do not think anyone will defend such a conscious untruth as that. In others, the best-known instance is that of the Doge's Palace at Venice; the pieces are cut small and arranged in a pattern or diaper; this is a less objectionable system, but is, nevertheless, a treatment more suited to bricks or tiles or some manufactured material which is always obtained of a particular form and size. The real solution seems to me to be found in those Venetian palaces—the Ca d'Oro, for instance—in which the slabs are arranged in panels outlined by a moulding or ornament, such as a cord, or what Mr. Ruskin calls the Venetian dentil. These mouldings are cut on the edges of slabs, which are built into the wall and form a perfectly constructional and legitimate tie for the facing, which no one could take for anything but what it is. The treatment does not imitate that of wood or stone, and indeed would not be suitable to either. It appears, and is, perfectly secure, and gives, as you know, very beautiful results. The Venetians of the fifteenth century seem to me to have been very happy also in their use of porphyry, verde antique, and other very valuable and rare marbles, which they set in frames like jewels in the fronts of their houses, sometimes in squares or diamonds, but more frequently in circles. I do not know whether the idea has ever been suggested by anyone else, but it occurred to me that possibly these circles may be the slices cut off the ends of the antique columns stolen from Constantinople and the East, to make them fit their new positions. The notion seems at first, perhaps, a little wild, but I do not know that there is really any great improbability in it. Of coloured marbles in columns there is little to be said, except that they seem most appropriate when of small scantling, and most beautiful when quite plain; fluting, twisting, or carving on veined or even coloured marble, whether in columns or otherwise, seems almost an insult to the material, and certainly spoils in the one case the beautiful lines of the natural veining, and in the other the breadth of the colour.

Pavements.

I must not leave the subject of marble without mentioning its use in pavements. The early marble mosaic, the opus Alexandrinum as it was called, to be found at Rome especially, in most of the ancient churches, is, to my mind, the most appropriate material for a decorative pavement ever invented. The marble is rich and beautiful in itself, and able to bear a considerable amount of wear and tear without material deterioration, and the patterns, being geometrical, never suggest the reluctance to walk upon them which one feels if natural objects are represented. The pattern is almost always founded upon the circle, one large one forming a nucleus round which others are arranged on the hen-and-chickens or planet-and-satellites system. The eye of each circle is usually a large piece of porphyry or other rare and valuable marble, and this is surrounded by a single, triple, or quintuple band of smaller pieces, which goes winding about and connecting the whole together. Then there are the marble pavements of St. Miniato at Florence and the cathedral at Siena, each unique in its way. That of St. Miniato, laid down in 1207 (I like to make the most of a date when I have one), is in black and white marble, the black forming the ground, with circles containing conventional animals in white upon it. The pavement of Siena Cathedral is a magnificent work in white marble, with Biblical scenes and architecture drawn upon it in incised lines, which are filled up with black mastic. The whole thing is magnificent as a piece of line-drawing on a gigantic scale, but simply abominable as a pavement. There is a rubbing of a part of it in the architectural court at South Kensington. While on the subject of pavements I should like to mention some which remain at Pompeii, and which are very suggestive for cheap floors. They consist of a concrete of broken brick or lava, making a red or black ground respectively, into which have been pressed, while it was wet, small tesserae of white and black marble, in various geometrical patterns, squares, diamonds, frets, or others. They are very effective, and I do not see that any difficulty could arise in reproducing them.

Furniture.

A vast quantity of marble, both white and coloured, is used in the furniture of the churches, in pulpits and fonts, stoups, screens, altars, and tombs. The early pulpits, or ambones, and the screens, decorated with opus Alexandrinum, and often, also, with glass

mosaics in geometrical patterns (the principal colours used in such mosaics are red, yellow, white, and dark blue or green), give one an idea of colour not to be acquired by the wildest dreamer in this country. Some of the more southern towns, such as Salerno, Amalfi, and Ravello, possess the best specimens of this kind of work, but there is a great deal also at Rome and a little at Ravenna. The beautiful white marble pulpits at Pisa and Siena, the work of Niccolo and Giovanni Pisano, are, I suppose, the finest specimens of Gothic furniture in Italy, but they are more works of sculpture than of architecture. (At South Kensington there are casts of the one still existing in the baptistery at Pisa and the one which was once in the cathedral.) The pulpits and other furniture in white and coloured marbles of the cinque-cento period, which are to be found all over the country, are most exquisite and refined both in design and execution, but would alone take a long paper to describe.

Carving.

In Italian architectural carving, though the figure sculpture is always most beautiful and interesting, and though almost all the foliage of the Roman and Renaissance periods in Italy is an acknowledged example to all ages and countries, it seems to me that much of that on the buildings of the Gothic period, while it has thrown aside the conventionality and refinement which make the beauty of the former, has none of that vigour and crispness which make up for the loss in the carving of our own and the French Gothic period, and upon which we set such a high value; in fact, many of the crockets, which are generally very large and set very close, look like very naturalistic cabbage leaves, while the undulating contortions of others strongly suggest flames; and when, as was often the case, I saw a gigantic finial with an ugly little half-length figure of some saint popping out of it like a jack-in-the-box, I was irresistibly reminded of a fairy tale that was once a favourite, in which an ogre appears to a child out of an actual cabbage. I do not care either for the foliage on the caps of the same period, which is naturally of much the same character. Some of you will at once think, I suppose, of Mr. Ruskin's eulogy of the caps of the arcades of the Ducal Palace of Venice; but even their beauty does not lie, I imagine, to any great extent in the foliage, but is due to the figure sculpture and the thought displayed in its design. I came across, however, one little piece of foliage of singular interest; it was the knob of a cap on an ambone in the cathedral at Ravello, near Amalfi, right in the south. It is work of the thirteenth century, certainly, but all the rest of the carving is purely Romanesque, while this piece bears something more than a strong resemblance to our Early English work; it is, in fact, the very thing itself. While on the subject of carving, I must not forget the name of Mino da Fiesole, a Florentine sculptor, who lived in the second half of the fifteenth century, and who did a large quantity of decorative work in the neighbourhood. There are several specimens of it at South Kensington. His sculpture in low relief, with its simple, sharp lines, is wonderfully well adapted to architectural decoration. Here is one very charming specimen of carved work in the external pulpit on the south-west angle of the cathedral at Prato. It is a circular structure in white and coloured marbles, with sculptured panels, surmounted by a moulded rail, corbelled out from the wall, and surmounted by a conical canopy, a little like an umbrella; the effect is novel and pleasing in the extreme.

Symbolism.

The Mediæval Italians thoroughly understood, and were very fond of, symbolism; and the traveller who has studied Mrs. Jamieson's interesting books will find that his pleasure is vastly enhanced by his power of deciphering the legends told by that means in the sculptures and decorations of all the more important Italian buildings. Not only were religious emblems used, but cities and historical events were represented by symbolical animals on the angles or over the doorways of their public buildings, giving something of the piquancy and interest which is to be found in our more useful and more grotesque gargoyles.

I find that I have wandered to some extent away from purely architectural subjects, but by way of returning to them I will say a few words about corbels.

Corbelling.

The Italians are exceedingly fond of corbelling, and use corbels and consoles of enormous size and projection. I remember some at Bologna, in the courtyard of the Palazzo Fava, 9 feet high and 5 feet 6 inches in projection. In the same town the whole side of a celebrated brick and terra-cotta house, in which the Caracci are said to have lived, situated near the Piazza St. Domenico, is corbelled out some 3 feet at the level of the first floor. The eaves of the roofs, which are frequently made of enormous projection for the sake of the shade in the streets, are in that case often supported on long carved wooden brackets, as, for instance, at the Bigallo at Florence. The corbels and consoles supporting the numerous window balconies in Italy, and the singing galleries, which are such a frequent and fine feature in the churches, are often of elaborate and beautiful design, especially those of the cinque-cento period. Corbel tables under cornices and strings were used in Italy up to the latest period, and many are elaborate and beautiful.

Balustrades.

A very common feature in the north-east, in Venice, Verona, Padua, &c., is a peculiar balustrade, formed of a number of little colonnettes generally supporting a solid-looking, trefoiled head, and surmounted by a moulded rail. The caps, and sometimes the spandrels between the trefoils and hollow in the rail, are carved with foliage; there are often no bases, and occasionally no caps either to the shafts, and very frequently the head is omitted, and the shafts directly support the rail. There is a very beautiful specimen in the red marble balustrade of the staircase at the Casa Priuli at Venice (the same house which has the corner window illustrated in Mr. Street's "Brick and Marble Architecture").

Balconies.

But I think these balustrades are most charming when surrounding one of the little balconies corbelled out from the house-fronts, as I have mentioned above. In Padua and Venice I remember them especially, and the extra charm often given to them by the little conventional lions or other figures perched upon the corners and peeping at the passers-by.

Twisted shafts.

Another feature which I remarked in Italy as being peculiar to the country is the twisted shaft, which seems to be used everywhere, from the building of the beautiful cloisters of St. John Lateran and St. Paul without the walls, at Rome, in the commencement of the thirteenth century, to the erection of the front of the baptistery of St. John at Siena at the end of the fourteenth. These shafts are generally exceedingly beautiful in themselves, and as they are most frequently used—that is, simply for decorative purposes; very seldom where a great weight has to be sustained—do not strike me as so awfully unconstructional. The variety of design is practically unlimited; a plain shaft twisted on itself is the simplest, and between this and the shaft, which is not only twisted but has, as well, three or four elaborately-moulded carved and inlaid threads running round it like the threads of a screw, there must be an almost endless number of varieties, each of which may be again infinitely varied by altering the mouldings, or making the turn quicker or increasing the number of threads. A further complication is sometimes introduced by twisting two shafts together, but that has, I think, always an unpleasing effect. Where these twisted shafts are used in door or window jambs they follow the example of the other mouldings, and run round the arch as twisted rolls.

Doors.

Coming to doors and windows, I cannot, of course, notice all the varieties, but must choose those which seem most beautiful or characteristic. There is one class of very elaborate doors which greatly excited my admiration. The most beautiful example I know is the south door of Orvieto Cathedral. The jamb and arch-mould consists of alternate chevroned rolls or shafts, and bands of conventional, very refined, and deeply undercut foliage, of an altogether exceptional type at the period, but strongly resembling the Classic acanthus. These are divided by rows of small dog-tooth ornament. The door is, as usual, square-headed, with a deep, rich green, bronze lintel, carved with little figures of our Lord and His Apostles. The arch is pointed, and the springing is marked by a band of carving, running into caps over the shafts, with a moulded architrave, which is carried across the lintel on consoles. In the tympanum are two little twisted shafts, which evidently once carried a canopy, under which was probably a figure of a saint; and there are also some remains of colour decoration. The whole (except the lintel) is in white marble, and the richness of the effect is perfectly enchanting. Many similar and not much less beautiful doors exist in the country. There is one on the south side of the Palazzo Comunale at Perugia, which is especially fine; it is much lower in proportion than the Orvieto one, and is finished with a semicircular arch. Over the door, on either side, is a bronze griffin overcoming a wolf, to commemorate a victory of Perugia over Siena. Another class of door which interested me a good deal, and of which there are some specimens at South Kensington (it belongs to the early part of the sixteenth century, and is therefore Renaissance), is that consisting of a flat pilaster on either side supporting an entablature, and surmounted by a semicircular canopy; each foot of the canopy is ornamented with a flower in a circle, surmounted by a five-leaved honeysuckle, and the summit has two such flowers supporting a finial. The tympanum is always filled with appropriate and characteristic sculpture.

At Venice, and now and then elsewhere—there are several specimens at Naples, and at least one in the interior of Milan Cathedral—many square-headed doors of the Gothic period are surmounted by a peculiar and very characteristic canopy. It consists, in its simplest form, of a pointed arch, with much carving and moulding, and much becrocketed, supported at the sides by large finials bracketed out from the wall. The *raison d'être* of this canopy is evidently to afford an opportunity for sculpture. A good simple specimen is the south transept door of the Frari Church at Venice. Similar canopies are very common over wall tombs. Some very beautiful specimens may be seen in SS. Giovanni e Paolo at Venice.

Windows.

Some of the most characteristic Mediæval windows in Italy are, I think, the circular ones which fill the gables of almost every church built between the beginning of the twelfth and the end of the fourteenth centuries. These might have been very beautiful features; indeed, it is always a difficult task to make a circular window in a gable otherwise, but unfortunately the dislike or ignorance manifested by Italians with regard to tracery prevented their being made the most of, and, with a few exceptions, all are designed on much the same pattern—a pattern which I do not like, because it strongly resembles and always reminds me of a cart-wheel; but that is a matter of taste. There are three honourable exceptions: two of them the east and west windows of Siena Cathedral, which are round holes filled only with glass and stanchion-bars; and the other an early window at Toscanella, near Viterbo, which is thoughtful, and, I think, very beautiful in design. When I speak of the dislike of the Italians for tracery, I do not forget that they used it, or one kind of it, to a very large extent at Venice; but I regard Venice as an altogether exceptional city—in architecture as in other things. And I must also make an exception in favour of some instances of plate tracery of the most exquisite beauty. I refer to the windows of the church of St. Michele in Orte, or “Or St. Michele” at Florence, and of the little church of the Madonna dell’ Arena at Padua, so well known for containing some exquisite frescoes by Giotto. Mr. Ruskin, if I remember rightly, gives unstinted praise to the former in his “Seven Lamps,” and says of it that “there is no more beautiful building in Italy.” Unfortunately, “doctors differ,” for Mr. Fergusson says in his history that it attracts attention “more on account of its curious ornaments than for beauty of design, which latter it does not, and indeed can hardly be expected to, possess.” I must say that, as regards the windows, I think Mr. Fergusson has made a mistake. Certainly the windows of the Padua chapel are some of the most charming and suggestive little features that I came across anywhere. I must also not forget that the tracery in Giotto’s campanile at Florence is beautiful and refined in the extreme. I do not remember a single instance in an Italian building of the use of a moulded mullion (I do not regard Milan Cathedral as an Italian building). If it was necessary to divide a window, shafts with caps and (generally) bases were used, carrying arched or trefoiled heads, and the frame and glass were set back to the inside of the wall. Sometimes, in very thick walls or where no glass is used, as in cloisters and towers, the shafts are double, or there is a long cushion capital similar to that found in the Saxon work in this country.

(To be continued.)

A LIBEL CASE.

AN action taken by Mr. M^cManus, a builder living at Brook Green, Hammersmith, against Mr. Buckler, architect, was tried before Lord Coleridge and a special jury in the Queen’s Bench Division, on April 5 and 6. The case, as stated by the plaintiff, was that he had, among other building contracts, carried out for the Duke of Norfolk at Arundel Castle certain extensive building work, in respect of which the defendant had acted as architect for the duke over the plaintiff, and that the works were finished by the plaintiff at a total cost of 46,000*l.*, about the end of 1880, and to the expressed satisfaction both of the duke and the defendant. That in March, 1880, the plaintiff, at the invitation of the defendant, still acting as the duke’s architect, tendered in competition with another for the erection of the chapel, hall, and tower for the duke at Arundel Castle, and the plaintiff’s tender was accepted at the price of about 27,000*l.* That at the end of 1880 or beginning of 1881 the defendant falsely and maliciously said to one Walford, an architect: “He is not a builder, but a speculative contractor, and is not capable of carrying out any good or large work. He will not be allowed to carry out any more work at Arundel Castle;” and, further, that in May or June, 1881, the defendant falsely and maliciously wrote to one Bradford, an architect, in these terms: “The person named in your letter is rather a speculative contractor than an experienced builder, and dependent upon the judgment of others, and not himself capable of carrying out large works.” And, further, that in May or June, 1881, the defendant wrote to one Wardle, architect and surveyor, a letter in these terms: “Mr. M^cManus is rather a speculative contractor than an experienced builder, and dependent on the judgment of others, and not capable of carrying out large works.” The plaintiff complained that these statements imputed to him that he was not competent to carry on the business of a builder properly, and was one who built houses solely on speculation, and with inferior materials and workmanship, and contracted for works on the mere speculation of his being able to carry them on and of their turning out well, without being a man of any substance or experience, or capable of exercising a right judgment of his own upon such matters, and that he had not properly carried out the works at Arundel Castle; and that, by reason of the letters in particular, he had been refused permission to tender for certain work for which

Mr. Bradford was architect, and had been seriously injured in his business. The defendant pleaded that he had not spoken or written the words complained of with the meaning attributed to them. And, further, that as to the words written to Mr. Walford and Mr. Bradford, they had authority from employers to admit competent builders to tender for large building operations, and that the plaintiff had applied to them for leave so to tender; and, therefore, they had in confidence applied to the defendant, who had superintended works which the plaintiff had taken a contract for, to give them his opinion as to the plaintiff’s qualifications as a builder personally to carry out large building works, and that any statements made by him to them were made confidentially and in answer to their inquiries and *bonâ fide* and without malice, and truly represented his (the defendant’s) opinion of the plaintiff’s qualifications for such employment, all of which the plaintiff denied. The defendant had been interrogated by the plaintiff as to the grounds of his statements, especially as to the work at Arundel Castle, and he had answered that the plaintiff had neglected to shore up the ramparts, and had made a mistake as to a corridor window.

Sir H. Giffard said the plaintiff found that he was being seriously injured in his business by reason of injurious statements, and for some time could not trace them to their source, but at last discovered that they emanated from the defendant, and he felt himself compelled to bring the action to vindicate his character, and protect himself from utter ruin and destruction. If, in truth, the statements complained of had been honestly made in answer to inquiries, they could be protected, but the case for the plaintiff was that they were not so, and that the defendant must have known they were untrue. That being so, it was not necessary to show from what motive he had uttered these statements, for if they were untrue to his knowledge, that of itself stamped and marked them as malicious. The defendant, in answer to interrogatories, had stated that the plaintiff was a plasterer by trade, and had no previous knowledge or experience of building, except of the commonest class, and had only taken a contract upon speculation, with the intention of subletting the higher class work to other persons. That was not a true description of the plaintiff (except that, like many eminent men, he might have begun with the lower kind of work), for he had for years been engaged, as the defendant knew, in high class work, and had executed such work to the satisfaction of the defendant himself.

The plaintiff stated that he had been fifteen years in business. On the completion of the works at Arundel Castle he asked the defendant to give him a certificate of satisfaction, in order that he might show it; but Mr. Buckler told him he would reply to any written communications. When he heard of defendant’s statements he called on Mr. Buckler, who said the report was but idle gossip. But defendant, while admitting that the works at Arundel were satisfactory, gave the credit to Traske, the sub-contractor for the masonry. Plaintiff said such a statement must be withdrawn. It had been alleged (said the plaintiff) that he had neglected to shore up part of the ramparts at Arundel Castle; but the shoring-up was no part of his contract, and what had been done was done against his will; and there was a mistake made by the clerk of the works which led to extra work, allowed as such by the defendant. As to the mistake in the main corridor window, it was as to some armorial bearings, and it was the mistake of the worker in glass who inserted the windows. These were the only complaints made against him as to the work at Arundel, and of these he had not heard until this action.

In cross-examination, plaintiff said that he had been two years apprenticed to a carpenter, and then for five years to a plasterer, and worked some years as a journeyman plasterer. For the last fifteen years he had been in business on his own account; he had first taken contracts, not having a building yard of his own. For seven years he had had premises of his own. He first had such premises two or three years before 1879. The first contract he had taken was fifteen years ago. It was a contract to do the plastering of a building. His first contract to build was at Studley Royal, for about 1,000*l.* He was not a mason himself; he employed a mason. The stone was not only cut and shaped at the quarries by Traske, but it was also fixed and put in position by his men, and he did the whole of the stonework of the two sides restored, but he did it under plaintiff’s supervision. Traske employed the foreman of the masons, who looked to the masonry, but they were under plaintiff’s control and superintendence. He believed that the libels prevented him from tendering for works for which he might otherwise have tendered. With reference to the “settling” of the rampart wall, he attributed it to improper interference on the part of the duke’s “clerk of the works,” and said that he himself had given proper instructions to secure the wall.

A plasterer named Isaacs, who was plaintiff’s general foreman at Arundel, confirmed the plaintiff’s statement with regard to the failure of the rampart wall.

Another foreman named Powell stated that he had under him an efficient staff of foremen, foreman of the masons, &c. The excavations at the foundation of the rampart wall had been improperly done, so far as he could judge contrary to all common sense, too much earth having been taken out. As to the rest of

the work, he believed it had been properly done, and duly attended to by the plaintiff, and Mr. Buckler never complained of anything so far as he was aware. Part of the stonework, he said, was done by Traske, but under his directions, and he gave instructions for the laying of every stone. He had as many as a dozen masons at work under him. The stones from Traske's quarries were fixed by Traske's men, but under his directions.

Mr. Rogers, architect, stated that he knew the plaintiff, who had done works on a chapel at Studley Royal, and also a church at Parkstone, under him. He had seen the letters complained of by the plaintiff, and he thought the words "speculative builder" disparaging.

Lord Coleridge observed that the more serious words seemed to be "that he was not capable of doing any large works."

The witness stated that the work done by the plaintiff under him was done satisfactorily, and much of it was masonry. No doubt some parts of the works were sublet, but that was usual; and in answer to Lord Coleridge he said that when a builder had a large contract comprising a variety of works he necessarily entered into sub-contracts for the various works—the masonry, the plumbing, &c. His lordship thought that on this part of the case the defence could hardly be sustained. It was not justifiable, surely, on such a ground as that to say of a builder that he was not competent to carry out large works.

The Attorney-General pointed out that the words were "not competent by himself to carry out such works, but that he was dependent on the judgment of others," not having had himself experience as a builder.

Lord Coleridge observed that the same might have been said of any great contractor, and of the greatest of all, the late Mr. Brassey, who originally was a farmer.

The Attorney-General said no doubt it might have been said, and said with truth, of Mr. Brassey, and could hardly be deemed a libel upon him.

Lord Coleridge said he only desired to express an opinion on this particular aspect of the case; he did not say a word as to the defence on the ground of privilege, and he pointed out that the evidence had not connected the alleged special damage (loss of contracts) with the letters complained of.

The counsel for the plaintiff said they only desired to vindicate their client's character, and were not so anxious as to the amount of damages.

Lord Coleridge again said that he desired to say nothing as to the formidable defence set up on the ground of privilege.

The Rev. A. Scoles, who had been an architect, gave evidence in favour of the plaintiff, and stated that he had executed works to his satisfaction, and that he thought the letters of the defendant disparaging to him. If he had not, he said, known the plaintiff for many years, reading such letters as these, he would not even allow him to tender for any work in which he was employed or interested.

Mr. Gandy, surveyor to the New Law Courts, said he had known the plaintiff for some years, and had known some work of his—plastering—which had been done well.

Mr. Brophy, who was surveyor for the duke at Arundel down to April, 1879, stated that he was well acquainted with the work that was done there by the plaintiff, and it was in his opinion well done, and he never heard any complaint about it except as to one window, as to which the duke had asked him if it was well done, and he answered that it was not done correctly.

Mr. Walford, architect, stated that he had known the plaintiff for some years. In 1881 he said he saw the defendant, Mr. Buckler; he went to him to obtain a reference, having some work to be done. He inquired of him as to the plaintiff, and he said "he was only a plasterer, and not capable of carrying out large works," adding that at Arundel he did not do the work himself. He (Mr. Walford) afterwards, being menaced with an action, informed the plaintiff what defendant had said. In cross-examination, he said that it was stated in answer to an inquiry by himself, and he considered it in confidence; and Mr. Buckler said it was so, and witness assented in silence; he did not dissent. In March 1881 he had written to plaintiff, "I could give you information," &c., but he did not tell him, he thought, until November. The defendant told him that he had thought M'Manus was an experienced builder, and found that he was only a plasterer, and that "one pushing man had introduced another."

At this stage of the case, several communications having taken place between counsel,

Mr. Horne Payne (in the absence of Sir H. Giffard) asked his lordship's leave to be permitted, with the Attorney-General, to see him in his private room.

Lord Coleridge at once assented, and the learned counsel accordingly saw his lordship in his private room. After some time the learned counsel returned into court and conferred together, and, when his lordship returned into court,

The Attorney-General said that, through his lordship's kind assistance, the counsel engaged in the case had been able to bring it to an amicable termination. His client (Mr. Buckler) had, he said, never had any hostile feeling towards Mr. M'Manus, nor had he volunteered anything, but he had only answered inquiries made of him, and his answers had been given confidentially, but had

been communicated to the plaintiff. In his answer, however, though he had only said what he believed to be true, he had used some expressions which might be misconstrued in a sense injurious to the plaintiff, and so he desired to withdraw them, and assented to a verdict against him to carry costs.

Mr. Horne Payne said he had certainly expected a more handsome apology from the Attorney-General, but his great object was attained—the vindication of his client's character. He had risen from the humble position of a plasterer, and had attained a most respectable position; he had, it must now be taken, executed the works at Arundel Castle satisfactorily, and he had been intrusted by the duke with another contract for 27,000*l.*, which was still to be carried out. Under these circumstances he was willing, on the part of the plaintiff, to accept a verdict for 10*l.* 10*s.* (to carry full costs), coupled with the retraction which had been offered.

Lord Coleridge: Gentlemen of the Jury,—I confess I think this is a satisfactory solution of this case. The parties having agreed to certain terms that satisfy them, you and I have nothing further to do. I entertain an opinion which I have already foreshadowed—I do not know whether I share it with you—that, to say of a contractor who is not familiar with all the different heads of work contained in a large building contract which, in the very necessity of the case, must contain work of a great variety of descriptions, that he had employed skilled masons for masons' work, skilled plumbers for plumbing work, skilled bricklayers for bricklayers' work, skilled joiners for joiners' work, and so on, would prove nothing whatever in justification for the statement that he was nothing but a speculative contractor and not capable of carrying out large works. According to my experience (which perhaps I have no right to give) and according to the good sense of the thing, no builder can be expected to know intimately the variety of trades with which he has to deal in the course of the conduct of his business. Therefore, it seemed to me that there was considerable difficulty on the side of the defendant, so far as I have heard the case, and of course I only express my opinion so far as I have heard it, in justifying the statements he had made. He says he cannot justify them, that is to say, he cannot plead that they were true, but he says they were not used in the sense in which they were imputed to be used, and that they were written in confidence. Upon that matter I neither entertain nor express a shadow of opinion, because I do not know what the circumstances are. But that was the difficulty in the way of the defendant. Then the difficulty in the way of the plaintiff appeared to me to be this. Although these were certainly derogatory expressions, yet there was considerable difficulty in showing not merely the definite connection and loss of this, that, or the other contract with these words, which, no doubt, it would be difficult in any case to show, but to my mind there was considerable difficulty in showing even the moral probability that what the plaintiff had lost had been in consequence of these two or three letters, because he was unable to say that in the number of contracts that he had tendered for he had reason for thinking that those contracts had been refused him on any other ground than that his tenders were higher than other tenders. Of course that would be damage for which the defendant would be in no way responsible if it could not be traced to the letters. Further, if when the plaintiff, rightly or wrongly, took it into his head he was being injured by Mr. Buckler he abstained from tendering, and consequently did not get any contracts, it would be very unfair as it seems to me to inflict on Mr. Buckler loss that was in part not traceable to anything that he had done, supposing the question of privilege to be out of the question, and in part in consequence of the plaintiff's own course of conduct by reason of his not tendering. Therefore it seems to me—and I am only telling you what actuated me in giving the advice I gave—that as there was a good deal of difficulty in seeing that the plaintiff could make out much of a claim to damages, and that as the defendant had a difficulty in justifying what he had done, except on the ground of privilege, it was eminently a case for a reasonable settlement; and that on the one hand the plaintiff should be content with such an amount of damages as would carry the costs of the action—which of course he ought to have—and that the defendant ought to say, as he has said, that he has said more than he can justify. Any man who has said more than he can justify ought to express his sorrow for doing it, as the defendant has done. Of course he acted upon the authority of other people. It is true that he made these statements, as he says, in confidence, and only when he was invited to do so—and only, possibly, on the information of the Duke of Norfolk's clerk of the works and other people who have not been called before us. A man must, nevertheless, take care in making a statement with regard to a tradesman that he does not say anything that he cannot justify. If a man says what is untrue, and cannot justify it, or if a man reports and repeats a slander, if it is untrue he is just as bad as the person who originates it, and very often much more so. Therefore a man who does that ought to say that he is sorry for that which he has done, and ought to pay such damages as will carry the costs of the action. If Mr. Buckler will allow me to say so, I think he should in future take care that he is not quite so hasty in saying things which might be equally truly said, as far as I can judge, of some of the first contractors in the world. We know in our experience that there are

many contractors who began from a small beginning, and that there must have been times at which a good many of them were unable to attend to all the work; yet they were none the less hard-working and honourable men, seeking to make a considerable position in the world, and so justly entitled to be respected as the great man I referred to. In my judgment, he (Mr. Brassey) was a great man, and carried with him to the grave the applause, reverence, and respect of everybody who knew him. Yet at a certain period of his life every word of that which has been said here might be said of him. Therefore it was by no means a right thing to say in derogation of a struggling contractor at a particular time when he was getting on in the world, that he did not do everything himself. A man gets to know in time things connected with the different trades in relation to building, and he may be perfectly able to carry out large contracts. Gentlemen, I have spoken more in detail than I should in order to explain to you how it was I came to give the advice that the learned counsel have been good enough to say they think is wise to take, because I do not like to do anything when a matter is before a jury behind a jury's back. I have given you the reasons why I gave the advice I did to the parties, and they are content to take it, therefore our duty is completed by your finding a verdict by consent for the plaintiff for ten guineas. I give a certificate for a special jury.

The Foreman of the Jury: The jury quite agree with your Lordship's remarks.

Lord Coleridge: The costs will follow the event.

THE NATIONAL GALLERY.

THE annual report of the Director of the National Gallery has appeared. Mr. Burton says: The total number of pictures now contained in the public rooms of the Gallery is about 1,050, exclusive of water-colour drawings. The *Colonna Raphael* (belonging to the Duke of Ripalda), though no longer exhibited to the public, still remains deposited in the building, the trustees being absolved from all responsibility for its custody while it remains there. The Duke has been requested to remove it as early as possible, which he has promised to do, and the picture has been repacked for removal.

In consequence of an appeal from the Board of the National Gallery, the Government, last session, introduced into Parliament a Bill to enable the trustees and director to lend to provincial institutions some works belonging to the British School of Painting which might be conveniently spared from the collection, but which, having been acquired by bequest or donation under certain restrictive conditions, it is at present impossible to lend without the authority of Parliament. It is hoped that no objections will be made to the moderate and carefully-considered provisions of this Bill.

Plans have been prepared for the erection of glass screens in the entrance-hall of the National Gallery for the prevention of draughts, which have long, and especially during the winter months, been a source of serious inconvenience to the attendants, the students at work in rooms near the main staircase, and to the public in general, besides exposing the pictures to sudden variations of temperature which cannot but be prejudicial to their condition. The lamentable deficiency of wall space for the accommodation of pictures in this annually-increasing collection has been frequently brought under the notice of the Treasury by the trustees and director, who look forward, not without confident hope, to provision being made by their Lordships in the coming Session to meet that most pressing want. It is earnestly to be desired that any additions made to the existing structure may be sufficient not only to admit of the present collection being commodiously displayed, but amply to provide against its certain increase while the buildings are in progress; and that such additions may be in harmony with and in furtherance of a greater plan for the completion of a National Gallery worthy of its destination. The constant influx of students and copyists (whose numbers increase at the average rate of 300 per annum) has rendered necessary a more methodical arrangement of copies and canvases temporarily left (for the convenience of their owners) at the National Gallery. Accordingly, two rooms have been set apart for this purpose, and fitted up on a system which insures order and avoids delay on students' days.

As nearly as can be calculated, the National Gallery was visited by 895,836 persons on the public days during the year 1882, showing a daily average attendance on such days (206 in number) of 4,348. These numbers must, however, be only regarded as approximate, no accurate means of checking them being in use. On students' days (Thursdays and Fridays), when the number of visitors entering by payment is registered by a turnstile, 34,260 persons were admitted between January 1 and December 31, 1882; the admission fees (at sixpence each) amounting to 856*l.* 10*s.*, as compared with 719*l.* 10*s.* 6*d.* received in 1881. The total number of students attending the Gallery on Thursdays and Fridays throughout the year 1882 was 20,750. There were 328 new students entered on the books. The daily average attend-

ance of students copying works in oil colours was 151, and in water colours 49. Independently of partial studies, 643 oil-colour copies of pictures have been made—viz., 392 from the works of 65 old masters, and 251 from the works of 38 modern painters. The pictures by foreign or old masters most often copied during the year were Greuze's *Girl with an Apple* (13 copies), A del Sarto's *Portrait of Himself*, Guido Reni's *Magdalen*, Murillo's *Peasant Boy*, and Greuze's *Head of a Girl*. The favourite English works have been Landseer's *Spaniels* (13 copies) and *Dignity and Impudence*, and Reynolds' *Age of Innocence*, *Heads of Angels*, and *Infant Samuel*.

The additions to the Gallery during 1882 have been unusually interesting. The following works have been purchased out of Government funds: W. Blake's *Spiritual Form of Pitt Guiding Behemoth* (100*l.*); J. S. Cotman's *Wherries on the Yare* (315*l.*); Gonzales Cogne's *Five Senses*, five paintings (910*l.* 0*s.* 8*d.*); Ercole di Giulio Grandi's *Madonna and Child with Saints* (2,970*l.*); Cima da Conegliano's *St. Jerome in the Desert* (493*l.* 10*s.*); Venetian School, *Portrait of a Young Man* (525*l.*); El Greco's *St. Jerome* (336*l.*); Venetian School, *Venus and Adonis* (1,417*l.* 10*s.*); Filippino Lippi's *Adoration of the Magi* (1,227*l.* 10*s.*); A. Mantegna's *Summer and Winter* (1,785*l.*); Botticelli's *Assumption of the Virgin* (4,777*l.* 10*s.*); North Italian School, *Last Supper* (630*l.*); L. Signorelli's *Circumcision* (3,150*l.*); Velasquez's *Portrait of Philip IV.* (6,300*l.*)

The "Clarke Bequest" enabled the trustees to purchase the following: Tintoretto's *Christ Washing the Feet of His Disciples* (157*l.* 10*s.*); Pantormo's *Joseph and his Kindred in Egypt* (315*l.*); Steenwyck's *An Interior* (204*l.* 15*s.*) Signorelli's *Nativity* was purchased out of the Lewis Fund for 1,200*l.* There have been three donations to the Gallery during the year, viz., *A Portrait of Mrs. Ann Hawkins*, by John Linnell; *A Legendary Subject*, by Lorenzetti; and an engraving, by James Frey, from a picture by Andrea Sacchi.

ELECTRIC LIGHTING.

A LECTURE was delivered at the Institution of Civil Engineers on the 5th inst., by Dr. John Hopkinson, F.R.S., the subject being "Some Points on Electric Lighting." The science of lighting by electricity was divided by the lecturer into two principal parts—the methods of production of electric currents, and of conversion of the energy of those currents into heat at such a temperature as to be given off in radiations to which the eye was sensible. The laws known to connect together those phenomena called electrical, were essentially mechanical in form, closely correlated with mechanical laws, and might be most aptly illustrated by mechanical analogues. For example, the terms "potential," "current," and "resistance," had close analogues respectively in "head," "rate of flow," and "co-efficient of friction" in the hydraulic transmission of power. Exactly as in hydraulics head multiplied by velocity of flow was power measured in foot-pounds per second or in horse-power, so potential multiplied by current was power and was measurable in the same units. Again, just as water flowing in a pipe had inertia and required an expenditure of work to set it in motion, and was capable of producing disruptive effects if that motion were too suddenly arrested, so a current of electricity in a wire had inertia; to set it moving electro-motive force must work for a finite time, and if arrested suddenly by breaking the circuit the electricity forced its way across the interval as a spark. Corresponding to mass and moments of inertia in mechanics there existed in electricity co-efficients of self-induction. There was, however, this difference between the inertia of water in a pipe and the inertia of an electric current—the inertia of the water was confined to the water, whereas the inertia of the electric current resided in the surrounding medium. Hence arose the phenomena of induction of currents upon currents, and of magnets upon moving conductors—phenomena which had no immediate analogues in hydraulics.

In the widest sense, the dynamo-electric machine might be defined as an apparatus for converting mechanical energy into the energy of an electrostatic charge, or mechanical power into its equivalent electric current through a conductor. When a current of electricity passed through a continuous conductor, it encountered resistance, and heat was generated, as shown by Joule, at a rate represented by the resistance multiplied by the square of the current. If the current was sufficiently great, heat would be generated at such a rate that the conductor would become incandescent and radiate light. Attempts had been made to use platinum and platinum iridium as the incandescent conductor. But these bodies were too expensive for general use, and besides that, refractory though they were, they were not refractory enough to stand the high temperature required for incandescent lighting, which should be economical of power. Commercial success was not realised until very thin and very uniform threads or filaments of carbon were produced and enclosed in reservoirs of glass, from which the air was exhausted to the utmost possible limit. Such were the lamps made by Mr. Edison with which the Institution was temporarily lighted. The electrical properties of such a lamp were examined, and in particular it was shown that its efficiency increased and its resistance diminished with increase of current.

The Institution was lighted by about 230 lamps, each giving sixteen candles light, produced each by 75 Watts of power developed in the lamp. To produce the same sixteen candles' light in ordinary good flat-flame gas-burners would require between 7 and 8 cubic feet of gas per hour, contributing heat to the atmosphere at the rate of 3,400,000 ft.-lbs. per hour, equivalent to 1,250 Watts, or nearly seventeen times as much heat as the incandescence lamp of equal power.

At the present time, lighting by electricity in London must cost something more than lighting by gas. What were the prospects of reduction of this cost? Beginning with the engine and boiler, the electrician had no right to look forward to any marked and exceptional advance in their economy. Next came the dynamo; the best of these were so good that there was little room for economy in the conversion of mechanical into electrical energy; but the prime cost of the dynamo machine was sure to be greatly reduced. Hope of considerably increased economy must be mainly based upon probable improvements in the incandescence lamp, and to this the greatest attention ought to be directed. It had been shown that marked economy of power could be obtained by working the lamps at high-pressure, but then they soon broke down. In ordinary practice, from 140 to 200 candles were obtained from one horse-power developed in the lamps, but for a short time he had seen over 1,000 candles per horse-power from incandescence lamps. The problem, then, was so to improve the lamp in details, that it would last a reasonable time when pressed to that degree of efficiency. There was no theoretical bar to such improvements, and it must be remembered that incandescence lamps had only been articles of commerce for about three years, and already much had been done. If such an improvement were realised, it would mean that it would be possible to get five times as much light for a sovereign as could be done now. At present, electric lighting would succeed commercially where other considerations than cost had weight. Improvements in the lamps were certain, and there was a probability that these improvements might go so far as to reduce the cost to one-fifth of what it now was. He left the meeting to judge whether or not it was probable—nay, almost certain—that lighting by electricity was to be the lighting of the future.

ARCHITECTURAL REVIVALS.

At the meeting of the Birmingham Architectural Association at the Queen's College, last week, Mr. Scruton in the chair, an address was delivered by Mr. J. W. Tonks, on the subject of "Architectural Revivals." The lecturer commenced by observing that in these days, when the word had "revival" become so hackneyed, it might cause surprise that he adopted it. It implied on the one hand that an art had been allowed to fall into decay, while on the other hand it might mean the renewed adoption of a former style, indicating a paucity of invention and adaptation in those who were its exponents. Unfortunately both those conditions were historical, and they should be noted, for neither the architect nor the public ought to become so enamoured of a past style as to follow it slavishly, and it was even more important that architecture in each age should be animated by a living spirit and a true ideal, for otherwise it would forfeit its position as one of the fine arts. Though architecture was regarded as one of the coldest and least sympathetic of the arts, yet there was hardly any other to any fault or failure in which the ordinary observer was really more keenly sensitive. If a building is ill-adapted for its purpose, if its proportions are inordinate, if parts are built for show and not for use, ordinary common sense is sufficient to condemn it. A mere garish display of ornament, a mixture of style in construction of a new portion of a building is in part contrast to the older portion to which it is added, it needed no special initiation into the mysteries of architecture to smile at and ridicule the absurdity. He believed also that the capacity to appreciate genuine architecture was also more general than might be supposed. Any visitor to a fine old cathedral would be surprised by its appropriate magnificence. So with a classic building in perfect proportion, or a Palladian edifice like St. Paul's. If a true ideal had animated the architect and had been carried out in his work it would appeal to a taste which was more general than was often imagined. Some architectural treatises assumed so natural and easy a development of style that they reminded one of the answer Topsy gave to a question, "Who made you?" She replied, "Nobody made me. I specs I growed." We are informed that the various Gothic styles of the Middle Ages probably grew in this way. The explanation was hardly adequate, and the experience of past ages went probably in another direction. Thus, ancient Egyptian art was closely allied to their religion; its rules and symbols governed the architect at every stage, yet in spite of conditions which seemed to forbid the outgrowth of a great style, one of signal excellence did arise. The lecturer stated his conviction that it was precisely because the art of ancient Egypt was the distinct expression of a religion that it became so great. If a man had a clear idea and wished to express it in a building he might succeed in doing so after some patience

and some preliminary failures. But if a man had no distinct idea, but a vague desire to say something rather like what his neighbours said, with a slight improvement, there was no probability of his expressing anything worth hearing or preserving either in a building or elsewhere. The miserable and incoherent examples of building without a purpose and upon an imitative plan were only too familiar as results of that vague eclecticism which some assumed as progress, but which was really degeneration of style. As an example, the architecture of ancient Assyria was in part a revival of Egyptian. In so far as it was derived it was inferior, and its noblest features were those in which it was distinctive. Coming to Greek art we were met by an entirely new set of conditions. Many theories had been put forth as to the rows of columns in Greek temples being derived from the pine supports of primitive wooden huts, but the Parthenon was created by the love of beauty and of poetry, which was the moving spirit in Greek art. There were two faculties of the human mind—the imitative and the inventive. The result of the constant exercise of the one is degraded imitation; the result of active exercise of the other is progressive art if in accord with true laws and principles. This appears to have been the mode of Greek art. If art crossed over from Egypt, what might have been a mere copy became a living creation, exquisite in grace, perfected in movement and finish. In Roman architecture we recognised the enslaved Greek, and amid all its magnificence there was seen the fatal degradation of imitative work. Mr. Fergusson, in his work on the architecture of Southern India, had done good service in the same direction, and the distinctive inventive styles of different regions were as marked as was the occasional similarity of some features to parallel characteristics of Western art. The spirit of Indian art moved westward. Through Persia, Arabia, and Asia Minor the new influence spread; all the more powerfully as Greek art arrived at its dotage of formalism and display. Byzantium, as capital of the Eastern Empire, was the centre of a new religion. Here the two influences met, and again in the history of architecture was religion to give life and character to what had been otherwise a mere hybrid style. The Pagan forms of Rome and the idol ornaments of Asia and India could not be acceptable to the rising spirit of Christianity. Therefore the Basilica, first adapted to Christian worship, furnished the form of building, and was decorated with forms and symbols suited to the Christian religion. The great Gothic movement was next reviewed, after a reference to the Moresque architecture, which was the result of Mohammedanism, and attained its high perfection in spite of the rules of the Koran forbidding the figures of human beings or animals being either carved or portrayed. The Renaissance was too much of a revival and too little of a new conception; the revival of letters made men more conversant with and more copyists of past styles. The revival became Palladian, degraded so that Pope could exclaim in his day—

Lo! what huge heaps of littleness around!

The whole a laboured quarry above ground.

We must admit that there had been a revival of an eclectic kind in modern architecture, though it was difficult as yet to estimate its force and direction. "Victorian," so-called "modernised Gothic," and "Queen Anne" had their turns, the only conceivable advantage of the latter probably being that it admitted of such freaks and fancies being incorporated into its quaint incongruities. Still all this was better than the unabashed ugliness of the Georgian period. The architect in these days had more to contend with and more to learn than formerly. His clients at times fixed the style for him. The new conditions of modern life should be his advantage and aid in giving us something new. The adoption of a really ecclesiastical style for secular purposes was undesirable. The rise of a truly living architecture of a style representing the present day in spirit and character must be gradual. The religious motive was hardly likely, for religions were as diverse as modern conceptions of style. The age of great cathedrals seemed to have passed; the age of great public buildings and large business offices seemed to have succeeded. The only course for the architect was to master the great principles of each style, to work on correct principles, and always to fit his edifice accurately for the use it was intended to serve. As to copying, Leslie advised young painters never to begin to copy a picture unless they saw something they could improve in it. The architect should certainly not do less, though he should be certain that his modification was improvement. His inventive faculty would certainly find its work in one awkward part which usually occurred somewhere, as every designer knew, and which would either be the plague-spot or the glory of his work. The lecturer believed that architecture would advance a new stage, with a new life and character. There was a desire for beauty in the humblest dwellings, that workshops and offices should respond to the calls of art, that streets should be picturesque, public buildings noble, and churches more worthy of the purposes they were designed to fulfil. With all this animated public sentiment, with all this wealth of opportunity and diversity of effort, it would be strange indeed if nineteenth-century architecture did nothing to justify the claim that it could not only adapt past styles, but that it had some ideas of its own.

A cordial vote of thanks was passed on the motion of Mr. James, seconded by Mr. Gething, and supported by Mr. Mantle, the chairman, and the secretary, Mr. Franklin Cross.

FIRES IN ANCIENT MANSIONS.

A LETTER has been printed in the *Times* from Mr. Loftus Brock, honorary secretary of the British Archæological Association, in which he says:—

The safety from fire of the old historic houses of England is a subject of so much importance that public service may be rendered by drawing attention to it in regard to the losses of the last few months. Ingestre Hall, a gem of late Elizabethan art, was burnt in October last. In the comparatively short time that has since elapsed, your pages have recorded the destruction by fire of Clevedon Court, a building dating from the fourteenth century; Woodbastwick Hall, of early seventeenth century date; Gunton Hall; Stanford Court, with its Elizabethan gallery; and Wrotham Park—or six mansions in the five months of autumn and winter. It was suggested at the time that Ingestre Hall was burnt from a beam beneath one of the hearthstones becoming ignited. I ventured shortly after this to draw attention in the *Times* (October 14, 1882) to the outbreak of fire in an ancient mansion, and of the discovery, under my direction, of beams entering beneath the fireplaces, several of which were found more or less charred and ready for conflagration. I enumerated a few practical works which I directed in the building referred to, and expressed the belief that this was no mere isolated case; similar defects of construction, either beneath the hearths or in the flues, would be found in many other similar mansions if examination were made, and that, if similarly attended to in time, serious loss might be prevented.

The unfortunate losses that have since been recorded appeared to be a painful commentary upon these remarks. I have accordingly, to test how far this hypothesis was illustrated by the buildings that have perished, made some inquiries of the owners and others, and now make public the results. I have undertaken this inquiry with the concurrence and support of the Council of the British Archæological Association, one of whose objects is to "preserve ancient monuments of the history of our forefathers." I have directed my inquiries more particularly to the most ancient of the buildings referred to, omitting Gunton Hall, which was ancient only in some portions, and Wrotham Park, a fine mansion, but erected only in the last century.

The noble owner of one of these mansions says that he has no doubt whatever that the fire was caused by an old beam being too close to the fireplace. In another case "the occupants had been alarmed for two days past by the smell of smouldering wood, but all efforts to discover the cause failed. A servant went into a spare room and found it full of smoke, and the adjacent one in flames." In a third, "the fire was first seen above, or in the line of," the flue of a fireplace that had not been lighted for some time, "close to the roof; but how it got there we have no means of knowing." In a fourth case, the cause of the fire is said to have been with but little doubt "the proximity of a beam to the hall chimney." Again, "in the oldest part of the house it can now be seen that there were beams under all the fireplaces. I think it would be well worth a visit from some members of the Archæological Society, to see the ruins and the curious construction of the house, and the immense quantity of wood used in the building." Thanks are due to the owners who have rendered me much assistance, without which it would have been impossible to conduct this inquiry. These evidences are submitted to the serious consideration of all owners of similar mansions, and I deem that a public duty is discharged in doing so. Such losses as these of the last few months are national ones, which cannot be replaced; and although, from my office, I am bound to regard them from the mere antiquarian aspect, yet, who can but sympathise with the family losses, the danger to life, and all the trouble attendant upon a conflagration? A little attention in time is absolutely necessary, and this truth may be accepted as the stern lesson taught by the losses that have been sustained.

EXPLOSIVE COMPOUNDS.

MR. G. M. ROBERTS, the manager for Noble's Explosives Company, has furnished some details of the explosive force of nitro-glycerine and dynamite, which will do much towards allaying a panic. They do not, he says, when exploded, exert such a force as is popularly believed. To speak precisely, the power developed by the explosion of a ton of dynamite is equal to 45,675 tons raised one foot, or 45,675 foot-tons. One ton of nitro-glycerine similarly exploded will exert a power of 64,452 foot-tons, and one ton of blasting gelatine, similarly exploded, 71,050 foot-tons. These figures, although large, are not enormous, and need not excite terror. Seventy-one thousand tons of ordinary building stone, if arranged in the form of a cube, would measure only 96 feet on the side, and if it were possible to concentrate the whole force of a ton of blasting at the moment of explosion on such a

mass, the only effect would be to lift it to the height of a foot. The foregoing figures are derived from experiments made at Ardeer with an instrument which gives accurate results in measuring the force of explosives. The power exerted by an explosion on surrounding objects is in the inverse ratio of the cube of the distance from the point of explosion. Thus, at 100 feet from the exact point of an explosion the power is only the cube of 1-100, or 1-1,000,000th part of what it is at a distance of only 1 foot from that point; or, in other words, if the power at 1 foot from the spot be represented by 1,000,000, at the distance of 100 feet it will be but 1. It is thus seen that the effects are intensely local, but comparatively trifling at even short distances. If a ton of dynamite or nitro-glycerine were exploded in a London street the effects would be felt severely in the immediate neighbourhood only of the explosion, and beyond that they would be confined to the mere breakage of windows. Indeed, it would be impossible by a single explosion, however large, to do damage to any considerable extent beyond the immediate neighbourhood in which the explosion took place. On one occasion Mr. Roberts happened to witness the explosion of over a ton of nitro-glycerine from a distance of only 60 yards. The nitro-glycerine was about 10 feet beneath the level of the ground, which was of sand and covered with water. Beyond the breakage of windows and the bursting of a few doors in the surrounding buildings there was no damage done. A little sand was thrown over him, but he received no personal injury. Vague statements have been from time to time promulgated to induce the belief that there are stronger explosives than nitro-glycerine and nitro-glycerine preparations, and that the wretched men who have been guilty of the late attempts on public buildings, &c., are in possession of more powerful explosives than any known to chemists. The public may rest assured that such is not the case. Nitro-glycerine and its preparations form the strongest explosives yet known. The strongest of these is the material known as blasting gelatine. It consists of nitro-glycerine combined with a certain proportion of nitrated cotton. It is much more difficult to prepare than either nitro-glycerine or dynamite, and cannot be made by unskilled persons. If the power of dynamite be represented by 1,000, that of nitro-glycerine will be 1,411, and of blasting gelatine 1,555.

The 1½ cwt. of nitro-glycerine seized by the police the other day would, if exploded, exert a force of only 4,833 foot-tons, and if converted into dynamite it would represent a force of only 4,567 foot-tons. The conversion of nitro-glycerine into dynamite reduces the power of the former, but renders it more easy and safe to handle and use. The power given above is comparatively insignificant, and as it is the maximum effect that could be produced under the most favourable circumstances on the very spot of explosion, it never could be obtained in practice. It is therefore absurd to say, as was said the other day in a London paper, that the explosion of such a quantity of nitro-glycerine would blow up the whole of London. In fact, the explosion could scarcely be heard over London, and the damage done by it would be strictly local. Mr. Roberts has often, by way of experiment, exploded a pound of dynamite suspended from the end of a fishing-rod by a string about 6 feet long, holding the rod in his hand the while. As there was no solid matter to project, he received no injury, and the end of the fishing-rod was not even scratched. About 3 feet of the string at the end of the rod was always left uninjured. It will be seen from the foregoing that the scoundrels who attempt to destroy public buildings are powerless to do much harm by their operations. They cannot by any means at their disposal lay a whole city in ruins—not even a street. They may injure special buildings, but that is the most they can do.

CHURCH BUILDING AND RESTORATION.

Yarmouth.—Plans have been prepared by Messrs. Bottle & Olley, Great Yarmouth, for extensive additions to the churches of St. John and St. Andrew in Great Yarmouth. The additions to St. John's comprise new south transept, south chancel aisle, turret, corridor, clergy vestry, and an octagon room of 27 feet diameter, and alterations to chancel. The additions to St. Andrew's are new north aisle, porch, and large room in connection with church and school.

Biggleswade.—The church of St. John the Baptist erected in Potten Road has been opened. The architect is Mr. Arthur Blomfield, and the work was carried out by Messrs. Page Brothers, contractors, of Buckden, Hunts. The stonework was executed by Mr. Wade, of Eaton Ford.

Litchborough.—The parish church of St. Martin has been reopened after restoration. Messrs. T. Cottrell, of Calworth, and J. Wootton, of Sulgrave, builders, have carried out the works under the direction of Mr. Hartshorn, architect, London.

Crowborough.—The new church of All Saints, Crowborough, has been opened. The church, which consists of nave and south aisle, apsidal chancel, chancel aisle and tower, has been built from the plans of Messrs. Whitfield & Thomas, Haymarket, by Mr. Payne, of Crowborough.

Withcall.—A new parish church dedicated to St. Martin has been opened at Withcall, near Louth. The plans of the building were prepared by Mr. A. W. Blomfield, and the work was executed by Messrs. S. & W. Pattinson, of Ruskington.

Thannington.—The ancient church of Thannington has been reopened after restoration. The contractor for the work was Mr. J. B. Cozens, and the architect Mr. J. Cowell, of Canterbury.

Tettenhall.—The church at Tettenhall has been reopened after restoration, which has been carried out at a cost of about 7,000*l.* by Messrs. Horsman & Willcox, contractors, of Wolverhampton, from plans by the late Mr. Street, R.A., under the direction of Mr. A. E. Street. The stone used in the work has been almost exclusively sandstone from the Codsall quarries, near Tettenhall.

West Coseley.—The new church of St. Chad, West Coseley, Sedgley, has been opened. The building is of brick, in Early English style, designed by Mr. T. H. Fleeming, of Wolverhampton, and erected by Mr. Guest, of Brettell Lane, near Stourbridge.

Earley.—St. Peter's Church, Earley, has been reopened after enlargement and restoration. The work has been carried out by Messrs. Wheeler Bros., of Reading, under the direction of Mr. F. Bacon, architect, of Parkhurst, Hants. The chancel screen and pulpit rail was executed by Mr. Barford, of Maidenhead, the communion rail standards and the gas standards in the chancel and nave by Messrs. Jones & Willis, the chancel paving by Messrs. Minton & Hollins, and the heating and lighting by Messrs. Williams, of Reading.

Wellington, Salop.—A new Wesleyan chapel has been opened. The works have been carried out from the plans of Mr. Herbert Tritt, architect, by the following contractors: Mason's, bricklayer's, and joiner's work, Messrs. Paterson & Son, Wellington; plumbing, heating, and painting, Mr. York, Wellington; plastering, Messrs. C. Howroyd & Sons, Bradford.

Rishton, Lancashire.—On Good Friday a new Congregational church was opened at Rishton. The plan consists of a central vestibule, and two side vestibules leading into the church, behind which is a large class-room and minister's vestry. The exterior walls are built with Yorkshire pierpoints and ashlar dressings, the style of architecture being thirteenth-century Gothic. The internal timber-work is pitch pine varnished, the windows being glazed with tinted glass in lead frames. Accommodation for 308 sittings is provided on the ground floor, it being proposed to erect a gallery at some future period which will give an additional accommodation for 150 persons. The work has been carried out under the supervision of Mr. William S. Varley, F.R.I.B.A., Architect, Blackburn.

SCHOOL BUILDINGS.

Govan.—A new Board school has been opened in Harmony Row. The site has an area of 2,110 square yards, and cost 13*s.* per yard. The school gives accommodation for 1,000 children, at 8 square feet of area for infants, and 10 square feet for other children. This new rule of the Education Department adds fully 15 per cent. to the cost. The school is two storeys in height, and the plan is arranged in the form of the letter T, as being the most suitable to the site—the back wing dividing the ground into two playgrounds. The infant department is on the ground-floor of the back wing, having a schoolroom 48 feet by 30 feet, and two classrooms 28 feet by 20 feet, and 20 feet by 20 feet respectively. This department is lighted from the south, west, and north. The height of the ceilings is 15 feet. The senior school, with similar accommodation, occupies the upper floor of the back wing. The juvenile section occupies the front of the building, on the ground-floor, the schoolroom being 39 feet by 25 feet 9 inches, and having two class-rooms—one 33 feet by 24 feet 3 inches, and the other 26 feet by 19 feet 3 inches. The partitions are of framed timber and plate glass—that between the largest class-room and the schoolroom being telescopic, so that the two apartments can be used when required as one. The junior school has similar accommodation on the upper floor of the front building. The stairs for boys and girls, whilst entirely separate, occupy the space of only one stair; whilst the whole is under supervision from any point. The stair-railing has been made 4 feet high, and the corner posts are carried through both flats to give stability. The plans were prepared by Messrs. H. & D. Barclay, architects, Glasgow.

Ilkeston.—The Ilkeston School Board, which was formed in 1878, has just opened its first set of schools. They are built on the Heanor Road, to accommodate 578 children, boys and girls. The architect was Mr. Tait, of Leicester; and the builder, Mr. Frederick Shaw, of Ilkeston.

The "Railway Age" reports that 766 miles of new American railways were laid in the months of January, February, and March last, as against 1,200 miles in the corresponding period of last year. It is estimated that an aggregate of 8,000 miles will be constructed this year.

GENERAL.

Professor Grimm has written an article in the *Preussische Jahrbücher* on "Raphael and the New Testament."

Sir Joseph Pease, M.P., has offered to erect a building for a free library in Darlington at a cost of 5,000*l.*

Messrs. Remington & Co. have published M. Jules Gourdault's "A Travers Venise," which originally appeared in *L'Art*.

Mr. Wakelam, of King's Lynn, has been appointed borough surveyor of Oswestry.

Mr. W. H. Mitchell, of Southampton, has prepared the plans for a new infants' school, to be erected by the St. Mary Extra School Board, Southampton.

Messrs. Crosby Lockwood, & Co. will shortly publish a book on "Saw Mills," by Mr. Bale, besides volumes on "Comparative Statics," "Lathe-work," &c.

Messrs. Borer & Dobb, of London Wall, E.C., have obtained first place in the limited competition for the new Congregational Church, Lower Edmonton.

The New Galleries of the Institute of Painters in Water-Colours in Piccadilly will be opened on the 27th inst. by the Prince and Princess of Wales.

The Belgian Government propose to contract a loan of 56,000,000 francs for the execution of public works in 1883 and 1884.

Additions are to be made to the Wesleyan chapel, Hyde Park Road, from plans by Mr. James Wilson, architect, 12 East Parade, Leeds.

A Report of the Glasgow School Board states that twenty-eight schools erected by the Board have cost (including sites) 399,644*l.*

The Management for the Loan Exhibition of Old Masters, Edinburgh, have already been offered over one hundred and fifty paintings, in addition to works which have been directly applied for.

A Litany Desk, designed by Mr. E. A. Ould, and carved by Mr. E. Griffiths, of Chester, has been presented to Chester Cathedral.

The Funds for the purchase of the Old Grammar School, Shrewsbury, for the purposes of a public library and museum, are now nearly subscribed, 450*l.* only remaining to be raised.

The Designs of Mr. George Baines, architect, Accrington, have been selected in open competition for new Baptist schools, Pole Street, Preston, and tenders for the work are to be obtained forthwith.

The Corporation of Preston have obtained the assent of the special committee of the House of Commons for their Bill to improve the navigation of the Ribble, and for the construction of docks.

A Public Meeting will be held on Monday at Newcastle-on-Tyne, to consider the raising of funds for the completion of the restoration of St. Nicholas Cathedral Church.

The West Riding Justices of the Peace have granted 3,600*l.* for the repair and enlargement of the Wakefield Court. The work will be begun early next month under the direction of Mr. J. Vickers Edwards, the surveyor.

"The Hawarden Castle," a new mail steamer intended for the South African service, has been completed by Messrs. John Elder & Co. The saloons have been completed from the designs of Mr. J. M. McLaren, architect.

Additions are to be carried out at the Governess's Home, Southport, according to the plans of Messrs. Maxwell, Tuke, & Hurst.

The Minister for Foreign Affairs at the Hague has announced, for the information of exhibitors at the International Exhibition at Amsterdam, that the Government make no charge for watching, sealing permits, or other Custom House formalities required with respect to goods sent from abroad.

Messrs. Phillips' Patent "Lock-jaw" Roofing Tiles have been selected for covering the towers of Rainhill Asylum, Liverpool, on account of their snow, rain, and wind-resisting properties, slates and ordinary tiles not being considered adequate to withstand the boisterous gales of so exposed a situation.

Mr. Shaw-Lefevre has stated that the competition for designs for the new buildings for the Admiralty and the War Office will soon be announced. But as the result is not likely to be arrived at soon, no vote will be taken for the erection of the buildings in the present session. A sum of 100,000*l.* has been inserted in the estimates towards the cost of the acquisition of the site.

Messrs. Trollope & Sons have completed four large panels in tapestry from the designs of Mr. A. S. Coke, and under the direction of Mr. G. T. Robinson. They are intended for Moy Hall, the residence of Mr. Mackintosh. The series represent four incidents in the history of the Clan Chattan, of which The Mackintosh is the chieftain—*The Battle of the Clans*, described by Sir Walter Scott in "The Fair Maid of Perth"; *The Treachery of the Comyns*; *The Tragedy of Bog-of-Gight*; and *Lady Mackintosh raising the Clan for Prince Charles Edward in 1745*.

CARLISLE.

For Additions and Alterations at the Workhouse Hospital, Carlisle. Mr. GEORGE DALE OLIVER, Architect. Quantities by the Architect.

Accepted Tenders.

C. & J. Armstrong, builder . . .	£1,650 0 0

LINDSAY'S
IMPROVED PATENT**REVERSIBLE TREADS AND LANDINGS**

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK,
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

A NEW SCHOOL OF ARCHITECTURAL TRAVELLERS.

THE paper which was read before the Architectural Association a fortnight ago, on the subject of "Italy," by a young member who had spent a month or two in that sunny land by way of a trip "in the spring of 1880," is one which we cannot pass over without a few words of comment; and in order to relieve the apprehensions of the author, as well as of such of our readers as

admire his moral courage, we beg so far to anticipate as to observe that we have nothing but commendation to offer to Mr. BAGGALLAY for what we regard as one of the most promising productions of the current architectural year.

The remark may be made in passing, we hope without giving offence, that it seems to be one of the many useful purposes of our junior architectural Society to afford certain opportunities for the development of practical professional enterprise, whether of thought or of action, which the senior Society is rather disposed to deny to the professional world. This must have struck many thoughtful men amongst us more forcibly than usual, perhaps, during the last three or four years. No one, of course, would expect (although, if we were rigidly questioned, we might after all not find it so easy to say why) that the Royal Institute of British Architects should devote one of its few and ceremonious sittings to hearing an account of a young man's trip through Italy. A trip through Sweden, or a journey in the Himalayas, or a week spent in Tunis, is much more to the point; but Italy has been exhausted long ago, and nothing can possibly remain to be said about its buildings, either ancient or modern, any more than about its thousands of pictures and statues and miscellaneous articles of *vertu*; for are they not all for ever disposed of in the teeming pages of MURRAY? Nevertheless, if anyone would wish to see reduced to a concise and comprehensive report the impression which a visit to the most interesting of all countries is calculated to leave upon the intellect and imagination of a typical young architect of the present moment, and will condescend to read it in a weekly journal instead of the "Transactions" of a learned Society, we can recommend Mr. BAGGALLAY's paper most sincerely and most strongly, as being, in our opinion, precisely what is wanted just now by those young and rising men who are to be the leading architects of England five-and-twenty years hence. In other words, the tide of our student-travel has once more turned in the direction of Venice, Florence, and Rome; and, be it observed, the views which will now be accepted of the multitudinous examples of architectural art there to be contemplated are as different from those which were received thirty or forty years ago as, in short, such a paper as Mr. BAGGALLAY's is different from the descriptions given by men like Sir DIGBY WYATT and Mr. STREET.

The history of English architectural travel may be said to have begun in 1802. In that year, as everyone knows, the adjustment of the Peace of Amiens allowed our islanders the opportunity, denied to them for many years before that time, of journeying all over Europe. Amongst other things, the Grand Tour architectural was at once instituted, and, although the chronic warfare of the age too speedily resumed its course, yet, after Waterloo had finally brought it to a close, the Grand Tour remained as a permanent institution, and our young architects—there were not so many of them then—went as regularly as clockwork, and almost as leisurely, through France to Italy, and through Italy to Greece, until Cockney taste, gradually purified by this slow process, should be completely refined on the summit of the Athenian Acropolis, retracing the route to smoky London charged to the full with reminiscences, not so much of the wonderful cities of the vigorous renaissance world of 300 years ago as of the mythology of PALLADIO, MICHAEL ANGELO, VITRUVIUS, and PHIDIAS, the right divine of "the five orders of architecture," and the mysteries of geometrical volutes, *entasis*, conic sections in

extremis, and *scamilli impares*. This was the end of architectural travel half a century ago.

The time came next when English sentiment reverted to baronialism, and so passed on to Gothicism; and travel therefore changed its views to correspond. Mediæval France, mediæval Germany, mediæval Italy itself, and at last mediæval Spain, drove out of sight more and more effectually the remains of the now despised *Cinquecento*; and as for Greece, English architects had ceased to know it, had "cut" it, in fact, dead. PHIDIAS had retired for ever into the British Museum. VITRUVIUS was voted a delusion and a snare. MICHAEL ANGELO was chiefly known as a muscular sort of person, "of very bad taste in architecture." The name of PALLADIO was suggestive of the royal compo statue at King's Cross washed away by the rain, and the dandy cement elevations of NASH in the Regent's Park, painted in four oils every three years in terms of the lease.

Sketching, under the *régime* of mediævalist travel, has been, as everybody knows, prodigiously in the ascendant. Not that the sketch-book was neglected in the old days of classic study; on the contrary, the columns of Jupiter Stator, the ruins of the Parthenon, the caryatides of the Erechtheum, the very dome of the Pantheon, were re-delineated and re-measured by every new comer, as if they had never been discovered before; but, when the thousands of piquant "bits" of all kinds of building which pervade old Continental towns were made the objects of worship, it is easy to see how the traveller's sketching came to be the sole index of his merit and the continual dream of his existence. In fact, it may be said with no little truth that the sketching of forms became the rival of the study of design, and that the architectural tourist often degenerated into the mere faddler with picturesque drawing, with whom quantity of amusement was of much more moment than quality of education, and the indulgence of a kind of coarse poetic sentiment vastly more important than all the cultivation of the refinements of grace. Hence it is, indeed, that at the passing moment the art of delineating the titbits of old buildings in masterly freehand has become so exquisite an accomplishment as to give a specific direction to English architectural designing, and not only competition perspectives are exhibited, but the edifices they represent are actually built, in a fashion of artistic composition which is sometimes, speaking critically, scarcely architectural at all, being pictorial enough, no doubt, and histrionic enough, but neither quite academical nor quite structural, and therefore wholly disappointing. But this is scarcely the subject we have in hand.

It is necessary, however, to make some such allusions as these in order to direct attention to the circumstance that Mr. BAGGALLAY, as we venture to think, represents a new school of architectural tourists. He has done his sketching, doubtless; but he has much more done his studying. Not that he pretends to have accomplished in the course of so hasty a "trip"—as he very properly calls it—anything like such an exhaustive review of the architecture of Italy as the old classic traveller, or the more recent Gothic explorer, may be considered to have so laboriously achieved. The new school of students is to be a sort of railway-speed school, a quick-discerning and somewhat superficial school, keen-witted rather than profound, clever rather than learned, but wholly practical instead of scholastic, having for its purpose the businesslike endeavour to grasp the motive of the manifestation as a whole, and to attain to an understanding of the mode of working which shall be in no way whimsical or fantastic or pedantic, but altogether utilitarian and workmanlike. In this view of the case we find Mr. BAGGALLAY speaking to his fellow-students of the Architectural Association in language like this: "I do not propose to act the showman, telling you in guide-book fashion that in such and such a town this and that building have such and such features of interest, but rather to attempt a short *description of those features which made most impression upon me*; and in the fear of failing to interest you by what I have to say, I have borrowed from my friends a number of sketches which are hung upon the walls." This, we repeat, seems to be very much the right way to deal with the case at the present moment. In so far as classical style is to be revived in England within the next twenty years, it must be done, not for the use of the Academy, but for the practice of the drawing-table. The five orders are entirely out of date. PALLADIO, VIGNOLA, CHAMBERS, are as dead as BATTY LANGLEY. That MICHAEL ANGELO was a person "of very bad taste in architecture" nobody will care either to assert or to deny. All the editions of VITRUVIUS

may go for waste paper. CALLICRATES observing the acanthus sprouting up around the basket on the maiden's grave will call up the smile of the cynic rather than the tear of the academician. What Englishmen want nowadays, vulgar and sordid as it may be in the eyes of the transcendental, is something that will work into good commonplace English design, without making the head ache or the heart either. A young man like Mr. BAGGALLAY does well to run through Italy—not to crawl through it—in search of this, and the young men of the Architectural Association do well to cheer him to the echo when he gives them a straightforward, workmanlike account of what he found. We have had almost enough of the students who sketch a great deal and see but little; we are ready now for some of those who, while sketching or not, as they please, see everything.

ART AND ARTLESSNESS.

BY LEWIS F. DAY.

WHENEVER a point of art is the subject of discussion, the difficulty of coming to an understanding is increased to an incalculable degree by the different meanings attached by the speakers to the terms it is necessary to use. To start with definitions would not greatly help us. Even if adversaries could for the sake of argument bring themselves to accept one meaning, we could not go far in the way of defining without stumbling upon other words standing equally in need of explanation. What a flood of light would be let in upon the question of decoration, could we but agree as to what is meant by the term "conventional"! An Englishman understands by conventional treatment such a rendering of natural forms as may be consistent with the decorative character of art. It implies to him that self-restraint, that intelligent selection, that recognition of the material in use, that regard for the position of the work, without which ornament is not worth the name of ornament. To a Frenchman, on the contrary, it stands for all that is hopeless in art. Nothing remains to be said of that which he has stigmatised as *de la convention*—he has expressed once for all his supremest contempt for it.

Nor is this merely a matter of nationality. It depends to a very great extent upon what is meant by conventional. Of course not all Englishmen are agreed as to what they understand by the word, nor all Frenchmen probably; but there is in its different interpretation in the two countries an explanation of the respect, as of the contempt, in which it is held. The continental use of the word is perhaps the more exact. The conventional is that which has come to be accepted, and, as a matter of fact, little or nothing is universally accepted until it is effete. What has been accepted becomes, therefore, insufferably tedious in modern art. Nor is there any hope or promise in it. The French artist is not far wrong in identifying it with stagnation. On the other hand, we find that it is mainly in the work of certain periods and of certain peoples that the principles which many thinking artists believe to underlie decorative art are found to be generally obeyed. In endeavouring to explain those principles, concerning which they have come to some sort of a general understanding or agreement, they adopted, in an evil hour, the term conventional to express that quality or kind of treatment which they considered apt to the purpose of ornament. But the elusive spirit of design was less easy to grasp than the forms in which it was embodied, and the cut-and-dried character of the examples adduced by way of illustration led to the supposition that the conventional was indeed the trite, the literal meaning of the word lending itself to the confusion.

There is little doubt but that the verdict of artists on conventionality is mainly according to their interpretation of the term. If by conventional ornament we mean perpetual variations on the same old tunes, tunes long since played out; if we mean adherence to the ancient types; if we mean imitation and mimicry, and a bigoted belief in the letter of the law as it was in the days that are happily past, only a Tory of the "good old" type (may we say without irreverence the "crusted" type) can consistently belong to the party of "convention." If, however, what we accept as conventional is rather the spirit in which in the past the masters of ornament accepted nature, always as guide, and inspiration rather than a "prompter," really reverencing nature most deeply—aye, and following her most truly—in that they were not content to copy, without thinking,

the forms nearest to hand, nor imagined that what she made fit for her purpose must, without modification, perforce be fittest for their very different purposes, then it seems hard to understand how ornament can be decorative without being conventional. A fitter term might be found for it, no doubt—myself I prefer to use the word "apt"—but in discussing the conventional we cannot ignore the current interpretations of the word, and the last given is as certainly what one party mean by it as the first is what their opponents understand.

One can scarce conceive of architectural ornament which is not treated in a manner more or less modified by considerations altogether apart from the natural forms on which it may have been founded. Even the human form, with which less liberty may safely be taken than with any other of nature's works, is not ready-made to the hand of the sculptor; and the great works of the masters, to which we accord the title of "monumental," are so in virtue of a something which was not in the model of the sculptor, but in his art. Call this quality what you will—conventional, traditional, monumental, ideal, artistic—something there is in all applied art (in all art for that matter, but we are speaking here more especially of decorative and ornamental art) which is, not contrary to nature, for it belongs to human nature, but non-natural in the sense that it is not borrowed directly from natural objects.

The reaction against the affectations of art that characterised the early part of the present century came not a moment before it was needed, and we owe all gratitude to the men who led opinion back to the almost forgotten paths of nature. It was only natural that in revolutionary times there should be excess. Now that the heat of the struggle is over, and all that was traditional in art is in danger of becoming extinct, it is time that we bethought ourselves that not all of these traditions were pernicious—perhaps none of them in themselves—for, whatever of perversion or degradation they may have suffered, they represent the embodiment of artistic experience in all time and among all nations. The masters must be presumed to have known something. If there was at one time a danger of artificiality in art, the danger now lies in the opposite direction of naturalism—a naturalism which assumes that a copy of nature is in itself a work of art, ignoring altogether the necessity of art on the part of the artist, calling it indeed by any title which will sufficiently express his contempt for it.

Nothing in art is easy, except to such as have a natural faculty in that way. It is not easy to paint a good study from nature, but it does demand ability of a lesser kind to succeed in that comparatively rudimentary effort than to paint a picture in which there is composition, unity, style, and all that goes to make art. In like manner, the mere painting or carving a sprig of foliage is within the reach of a half-taught amateur; but to adapt that foliage to its position and purpose, to design it into its place, and to treat it after the manner of wood, stone, stained glass, or what not, demands not only thought and natural facility but technical training. It is easy to ridicule conventionality, if it is to be so called; but there has not yet been produced any decoration worth mention in which a more or less non-natural treatment has not been adopted. In other words, the artist has not hitherto been able to dispense with art. Certainly mere sketching will not supply the place of that of which it is only a very small part.

Those who feel the need in decoration of a quality at which the modern nature-worshipper delights to scoff, will feel disposed to pray that they may be preserved from some of their allies. The late high priest of conventional ornament did not indeed reject all that was natural, but he considered ornament by so much the worse according as it could be traced to a natural source. His followers appear to have proceeded on the theory that to emasculate a natural form was to fit it for ornamental use, and so at last was evolved a style of diagram (it cannot be called design) which, although it was certainly more nearly akin to the science of botany than to the art of ornament, more than justified the ridicule of the naturalists. But it is no more just to take this childish work as representing conventional design than it would be to put forth the production of a feeble amateur as an example of naturalism. Compare the best ceramic painting of Sevres with the best of Ancient Greece or China or Japan; compare the work of PALISSY with Persian lustre ware or Hispano-Moresque pottery, and who would not choose the more conventional art?

I am not contending for the word conventional, but for the fit treatment of ornament—a treatment which men persist in

calling by that title, more especially when they want to swear at it. We cannot afford to let go our hold of that, by whatever name it is to be called, which distinguishes the decorative art of the best periods and the greatest masters from the crude attempts of those who have not yet so much as grasped the idea that there is in art something more than a dishing-up of the raw facts of nature.

It remains to be proved that the naturalistic artist is more true to nature. He professes, indeed, to follow nature, but is he not rather dragging nature into the dust? There is a wider view of nature which includes human nature, and that selective and idealising instinct which is natural to man. It is one thing to study nature, another to pretend that mere studies from nature are works of art. In no branch of art has it ever been held by the masters of it that nature was enough. It is always the tyro who is overpowered by the model before him; a master of his craft compels it to his special purpose. The poet, painter, sculptor, architect, musician, actor, inasmuch as he is an artist, *conceives* where others *crib*. "Lor! how natural," says the rustic. Thinks the connoisseur to himself, "What perfect art!"

THE BUILDING EXHIBITION AT THE AGRICULTURAL HALL.

(Continued from page 246.)

THIS exhibition, as we intimated in our last, closed on Saturday evening last, and is generally pronounced to have been a success. It was visited by a great many of the profession, and the general attendance was good. Most of the exhibitors with whom we conversed appeared satisfied with the results, and we believe the actual amount of business actually negotiated was in excess of what was anticipated. A large number of the exhibits will be removed to Birmingham, where Mr. SHRAPNELE opens the second building exhibition in the Midland metropolis on the 30th inst. It may be mentioned that he was presented with an illuminated address by the exhibitors at Islington, expressive of their satisfaction at the way in which the arrangements were conducted. We now append an account of the remaining exhibits that we consider worthy of comment.

Occupying a central position in the body of the hall, Messrs. STEVEN, BROTHERS & Co., of Upper Thames Street, and Milton Ironworks, Glasgow, had a large collection of iron goods, which was as diversified in its detail as the ground area it covered was extensive. In builders' ironwork were to be seen most articles required in the trade, from a common gutter-pipe to a highly-ornamental baluster or spiral staircase, the designs of many of the exterior pieces, such as rain-water heads, finials, &c., being remarkably good. In constructive ironwork this firm during the last few years has taken a leading position, and many notable public works have emanated from their foundries. In interior appliances they are equally well to the fore, the collection of register grates, stoves, &c., shown here embracing a wide range as to quality and price. Kitchen ranges are also a speciality with the firm; and their highly-finished close range, with every modern improvement, ranks amongst the best manufactured. The cast-iron enamelled bath is another item promoting domestic comfort to which they have paid much attention, and a new one shown here for the first time possesses a veritable improvement, in the fact that the waste is cast with and made a part of the bath itself, instead of appearing as a separate pipe or outlet. A range of stable fittings formed another prominent object in the stall, which as a whole reflected great credit on the firm.

A considerable display of wirework for both building and horticultural purposes was made by Messrs. JEFFERY & Co., 115 Oxford Street. The builders' requisites included a collection of the screens and sieves used by the operative in preparing material, &c., for his work; guards for greenhouses and skylights, &c.; a very good specimen of a cheap "lean-to" greenhouse, made so as to be extremely portable and easily erected or taken down; and a large collection of horticultural wirework of great diversity. There was also an extensive assortment of garden seats, tables, and similar appliances.

The popular little "BISCHOP" gas-engines of 2 and 4 h.p., to which we have often adverted in these columns, were shown by the proprietors, Messrs. J. E. H. ANDREW & Co., engineers, of Stockport.

Messrs. STUDD, ABRAHAMS & Co., engineers, of Kettering, exhibited a combined mortar mill with engine and boiler with a 6-foot pan, and a mill only with a 7-foot pan. The mills of this firm have advantages over those mills in which the pans revolve. When the pan in the ordinarily-constructed mill is driven, its weight, together with that of the false bottom and roller, drives the wheel and spindle, and the materials when mixed are carried on a toe-step bearing under the pan, which wears very rapidly, and, being in an awkward position, is often a cause of trouble and expense. In those exhibited by Messrs. STUDD, ABRAHAMS, & Co. this bearing is dispensed with, and the inventors claim that their mills will run for years without adjustment. Each mill had two pairs of scrapers, which turn the mortar over twice in each revolution, and also discharge it mixed direct into barrow or truck.

The Woolpit Brick and Tile Company, Limited, Woolpit, Suffolk, had an excellent collection of their manufactures, consisting of dark red facings, light red and hard red facings, a variety of white facings, white moulded and white rubbers, &c. The productions of this firm are well known in the trade as being of good and trustworthy character.

The Æolus Waterspray and General Ventilating Company, Limited, 235 High Holborn, attracted considerable attention with this comparatively new ventilator, of which several examples were shown. They also exhibited a patent multi-tubular ventilating stove, heated by an atmospheric gas-burner in shape like a gridiron, the rows of jets burning between the hot-air tubes, the fresh air being drawn from the outer atmosphere, and heated in its passage through the tubes before it is discharged into the apartment.

Messrs. THOMAS SMITH & Co., Canal Potteries, Old Kent Road, S.E., were present with a good representative display of their productions, which comprise all kinds of sanitary ware in brown stoneware, as well as terra-cotta. The collection also included several samples of chemical apparatus and water filters. Domestic stoneware in white, glazed sinks and kindred appliances were good features in the exhibit, and their terra-cotta chimney tops, terminals, &c., looked equally well.

A collection of the numerous articles coming under the head of mill furnishings was shown by Messrs. A. LUSTY & Co., engineers, of Elthorpe Road, N., who also exhibited some very good and moderate-priced wood-working machinery, including a hand-power band-sawing machine, mortising machine, band and circular saws, &c.

Builders and cabinet-makers' brass foundry was well represented by the old-established firm, Messrs. WM. UDAL & Co., Bromsgrove Street, Birmingham. The collection embraced a large assortment of door and lock furniture in enamel, brass, glass, china, wood, &c., many of the designs being of most artistic character. In the cabinet department were examples of the Chippendale, Queen Anne, Mediæval, and other styles. There was a variety of stable, carriage, and window fittings, and also a collection of fire-irons, dogs, and fire-brasses of the present style. The firm also exhibited BRUCE's patent fanlight opener, which is of simple and effective construction for locking, opening, and closing all kinds of ventilators. It can also be applied to doors, and the appliances to which it is fixed can be secured at any angle by simply turning the set screw. It can also be arranged to open any number of lights, at whatever elevation they may be fixed.

Another collection of general brass-foundry goods, covering a wide area as to uses, and containing some meritorious examples, was shown by Messrs. YOUNG & BUSS, builders' ironmongers, of Blandford and Blenheim Streets, W., supplemented by a variety of electric bells, burglar and fire alarms, &c., of the usual character.

The Belfast Wire Works and Patent Felt and Grease Manufactory (Mr. JOHN ROGERS), Victoria Street, Belfast, sent an interesting assortment of felts for building and other purposes. They included roofing, sheathing, and inodorous felts, and a damp course, or foundation-felt. There was also a hair-felt for covering steam pipes and boilers. A varnish specially adapted for felts, wire web for manufacturing purposes, wire netting, a variety of wire shop-window guards, &c., figured amongst the display.

Messrs. W. & R. LEGGOTT, Charles Street, Bradford, exhibited their fanlight-opener, worked by a continuous cord, and adapted to many kinds of ventilators, skylights, fanlights, &c.

MAIGNEN'S "Filtre Rapide," 22 and 23 Great Tower street, adapted to the filtration of water on a large scale, for

wines, spirits, &c., and for general domestic purposes, was shown by the inventor in a variety of forms. Mr. MAIGNEN embodies the principle of softening water, wherever necessary, with that of filtration, all of which is accomplished by means of the one medium he employs, which is mixed according to requirement, and the filters being made in loose sections, the whole can be cleaned, the filtering medium altered or replenished at any moment with absolute ease, and by the most inexperienced person.

A profusion of appliances connected with domestic fittings in hardware was shown by Mr. WM. BURLEY, Tower Buildings, London Wall, who claims a speciality for such appliances. They embraced portable electric bells, requiring no fixing, most useful for invalids, &c., all kinds of electric bells and burglar alarms, and safety alarm bolts, applicable to any kind of door, &c. Improved blind furniture, and YOUNG'S patent cord hold-fasts, that have obtained a large sale, were amongst the exhibits, and window latches, sash fasteners, and other articles helping to attain security and ventilation.

Mr. JOHN STONE, of Ulverstone, was present with samples of his well-known revolving shutters, which do not require detailed description here. We, however, desire to call attention to his patent safety hoists, an admirable invention for the prevention of accidents in connection with well-holes, &c., which cannot be too highly recommended, when the number of accidents that annually occur from trap-doors and similar openings being left unguarded are considered. The hoists are so arranged that on their passing each opening revolving shutters or sliding doors working automatically with the hoist itself open and close them. A provision is also made where it is not necessary to close the openings with every passing of the hoist, to put this arrangement out of gear by simply altering the position of a lever fixed on the ground floor.

The Silicate Zopissa Composition and Granitic Paint Co., Fish Street Hill, E.C., exhibited several specimens illustrating the value and uses of their invention as applied to bricks, plaster, panels, and textile fabrics, and similar examples made with a colourless liquid, Zopissa, showing its non-porous attributes. Samples of the effects of their granitic paint as applied to wood or iron were also shown, as well as others specially prepared for naval, architectural, colliery, and engineering purposes, for which they claim several advantages.

An excellent liquid metal polish, suitable for cleaning all kinds of metal goods, was shown by Messrs. J. BOCHLEN & Co., 37 Wallbrook, E.C.

MESSRS. BRAZIER & SON, 106 Blackfriars Road, S.E., exhibited their patent deodorising self-acting water-closets, and other kindred appliances. The deodorising closet is offered to the public as a substitute for the old pan closet at about half the cost. It is easily fixed and requires no metal-work under the seat, while a simple arrangement secures the admission of an aromatic or deodorising material to enter the closet every time it is used.

An exhibit of a scientific character was contributed by the Galvano-Mercurial Silvering Company, Wells Street, Hackney, who introduced specimens of daylight-gas, and electric-light reflectors, and footlights, and basement reflectors, including photogenic and scientific appliances for increasing the power of light, either artificial or natural. A new vitrified material named "opero-sectile," and another, "albatrine," are used in connection with a new process for super-seding glazed tiles or paint for basements, walls, ceilings, &c. The exhibit also comprised a variety of articles, including some models from the Gas and Hydraulic and General Engineering Co., of Winnipeg, Canada, connected with the saving of life from fire, extinguishing fires by gravitation and the ordinary means, fireproof cloth, firemen's uniforms and equipments, fire-engines, &c.

A new firm of aspirants connected with the decorating trade—the Patent Embossed Tapestry Co., who at present have only temporary offices at 117 Chancery Lane—sent an assortment of their productions, which they term "permanent embossed tapestry for wall decorations, &c." We shall not at present enter into a further description of the material, which we leave for a future occasion.

MESSRS. SMITH & TURNER, of Bartholomew Close, E.C., contributed BEN TURNER'S patent adjustable regulating door-springs, an improved adjustable slam hinge, various window catches, bolts, and casement fasteners. They also exhibited a number of sanitary goods, including lavatories fitted complete,

lavatory basins, Bramah and other closets, butler's sinks, baths, and bath and other brass fittings.

The Torbay and Dart Paint Company, Limited, whose works are at Dartmouth, were well abreast of their competitors with their specialities. Torbay paint is too well known to need further comment, and the fact of its being used so extensively by the Government for the dockyards and War Departments, Colonies, &c., is a good proof of its value.

Mr. CHARLES WOOD, Shirland Road, Paddington, exhibited a most extensive collection of bricks, tiles, terracotta samples, and many other articles composed of burnt clays that enter into the requirements of the building trade. The exhibits included the blue and red Staffordshire goods of the Walsall Wood Colliery Company, LOCKHART'S Luton bricks, the Hathern Station Brick Company's specialities in syenitic stone, comprising window-heads, sills, coping, flagging, domestic goods, &c., as well as a good collection of terracotta ware of varied character from the same works, which helped to make the exhibit in its combined form not the least attractive in the hall.

The Antiseptic Apparatus Company, 46 Queen Victoria Street, E.C., and Bermondsey Street, S.E., showed their patent antiseptic apparatus, which is a very useful and effective appliance for the purpose of injecting a measured charge of disinfectant into the pans of water-closets of every description, each time they are used, and so destroying the ill effects of sewer gas. The firm have lately adapted the principle to flushing tanks for urinals and water-waste preventers, which were also in action at their stand. The former of these is made in two compartments, the most useful size holding 25 gallons of water and 10 gallons of the antiseptic fluid; but the disinfectant being very powerful, the apparatus is so contrived that only a quarter of a pint discharges with the full body of water, so that it is only necessary to renew the fluid about every three months. The arrangement of the water-waste preventer is similar, as by pulling the lever for a flush of water, a small charge of the disinfecting fluid is introduced simultaneously. They are well worthy of notice, and we understand they have been adopted by several public bodies, including the Corporation of the City of London, the Great Northern Railway Company, &c.

MESSRS. LAMB & Co., 119 Finchley Road, N.W., had a very complete collection of the various ventilators patented and made by them, comprising the Triumph ventilator, a two-cone ventilator for drain-pipes, a railway carriage ventilator, ship ventilators for extracting foul and supplying fresh air, and the Triumph smoke-cure chimney cowl. These ventilators and cowls possess many advantages over the ordinary revolving ones in having two or more cones revolving above the exhaust-chamber, and the wings are so arranged as to give the greatest possible amount of suction. The railway carriage ventilator is compact and simple, and we should imagine would prove a very effective means for clearing smoking and other compartments of foul air, &c., without draught.

A good exhibit of disinfectants was that of JEVE'S Sanitary Compounds Company, Limited, 43 Cannon Street, E.C. The various productions of this firm are now pretty well known, and comprise a disinfectant fluid known as JEVE'S perfect purifier, a disinfectant powder, household soap, soft soap, and dog soap, samples of each of which were shown. They also make a preparation for preserving wood, consisting of creosote made soluble, which it is claimed penetrates more thoroughly than that ordinarily used.

Another firm of art metal-workers represented was Messrs. JOHNSON BROS. & Co., Limited, 6 Waterloo Place, S.W. They sent several very good specimens of original design and first-rate finish in altar-rail standards, balusters, gates, grills, &c., in wrought-iron and iron and brass. Messrs. JOHNSON BROS. are also patentees of a system of glazing without putty, the principle of which is similar to others already described, and which are fast superseding the old method.

Mr. ALEXANDER DICK, Cannon Street, had a numerous variety of engineers' and house fittings, &c., in "Delta" metal. It is claimed for this metal, which may be termed an improved brass, that it is as superior to brass as steel is to iron, or as phosphor-bronze is to ordinary gun-metal; and that it can be forged and rolled hot, or may be drawn into wire when cold. It is exceptionally tough, and in the shape of castings is very fine and close in grain, and less affected by the atmosphere than its prototype. It is applicable for very numerous purposes.

The Universal Ventilating, Sanitary and Engineering Company, Limited, Lewisham Bridge, S.E., sent a collection of STEVENS' galvanised and terra-cotta chimney tops, of which they are the proprietors. The exhaust ventilators, by the same inventor, and a drawer inlet ventilator figured amongst the collection, which was of the usual character shown by the firm.

The Canal-Head Foundry and Engineering Works, Ulverston, exhibited a handsome black and gold case, containing a revolving wood shutter worked by their patent balance-weight motion, an arrangement that has much to commend it for large and heavy shutters. In contradistinction to this was a curvilinear iron shutter, actuated by their spring motion, which also found many admirers. The firm in addition exhibited some patent joiners' bench knives, to enable wood to be securely held on the bench, &c.

A good collection of varnishes, and examples of their appearance on grained and marbled work, and others showing their effect on enamelled slate, were exhibited by Messrs. MEREDITH & Co., of Lionel Street, Birmingham, a firm who have passed "the century" since their establishment as varnish makers. Considering the immense quantities of this protective required in many of the Birmingham trades, there seems to be no valid reason why the Midland metropolis should not take a front place in this important industry, and Messrs. MEREDITH & Co. are certainly in the front rank amongst their many competitors.

Messrs. EWART & SON, of the Euston Road, confined their exhibit on this occasion to specimens of ornamental workings in zinc, mainly in stampings, showing their adaptability to all ornamental purposes, more particularly where lightness and small cost is an object. The subjects were arranged upon a structure of pyramidal form, and comprised examples of dormers, vanes, finials, cresting, mouldings, &c., a number of figures and animals' heads forming a conspicuous feature. The comparative ductility of zinc, coupled with its slight deteriorative features from oxidation, weigh considerably in its favour, and Messrs. EWART have of late applied it with success in large works.

Lincrusta-Walton: its popular name is too well-known amongst the profession to leave us much opportunity of introducing any new remarks in its favour, and any detailed description of its mode of manufacture would be superfluous. It is amongst the most effective wall decorations of the age, and considering that it is waterproof, and capable of being washed with soap and water without injury, it is at once placed in the front category of the most unique decorative features of the day.

Amongst the many assortments of tiles and other decorative features exhibited may be mentioned the display made by Messrs. MILLER, LITTLE & Co., Devonshire Street, Portland Place, W., which embraced most of the uses to which the clay ornament has of late been utilised. Beyond these the firm exhibited many specimens of decorative art in the form of painted panels for doors, cabinets, &c., screens and friezes, indelible tapestry paintings, vases and plaques, as well as a collection of painted and stained glass suitable for all domestic purposes.

Messrs. JOSEPH DAVIS & Co., opticians and meteorological instrument makers, of Kennington Park Road, who appear to secure an *entrée* into most exhibitions, displayed an assortment of instruments, those connected with the building trade, such as drawing cases, surveyors' and builders' levels predominating. Chirometers, compasses, and specific gravity and other testing apparatus came in for a share of attention, as well as the popular royal "Polytechnic" barometers.

Messrs. JOSIAH MOORE & SONS, St. James's Walk, Clerkenwell, showed a collection of their well-known glass ventilators for windows, and glass letters in various colours, which need no further comment, being widely known. Mr. A. DORRIT, of Portsmouth, exhibited a new hydraulic water-closet named the Excelsior, which brings the flush of water into play by the seat being depressed with the action of sitting upon it.

Messrs. H. W. COOPER & Co., 28A Upper George Street, Edgware Road, had specimens of their patent glass revolving, circular, and sliding ventilators, improved glass louver and Venetian ventilators. This firm were the first to introduce these circular ventilators, which are now so generally used in plate-glass windows, and the fact that they have been largely imitated is a strong proof of their popularity and utility. They can be cut from 4 to 24 inches diameter, in any size plate or

any kind of glass, and to any design in plain, ornamental, stained, or painted-glass windows, and without the glass being taken out of the sashes, so that they are suitable for churches, halls, mansions, shops, skylights, &c.

A collection of improved wood-working machinery by Messrs. HOPKINSON & PRINCE, 15 Wallbrook, includes band-sawing machines, in which by means of india-rubber covered rims and other improvements in the construction, the chance of the saw giving way is reduced to a minimum. Special attention appears to have been given to the finish of these, and the same may be said of the tenoning, boring, and planing-machines, and the various lathes exhibited. The "Wordsworth" gas engine shown by this firm is one of the latest additions to the market in this class of motor, and possesses some improvements well worthy of attention. It is specially designed for small power users, and it is claimed for it that it can be left with perfect safety to be attended by a boy or girl.

Messrs. J. G. THOMAS & Co., Edgware Road, and 87 Queen Victoria Street, E.C., sent a first-rate assortment of their various wire goods. Fancy wire work, such as garden arches, rose temples, aviaries, bird-cages, and conservatory fittings, we may remind our readers are specialties for which the firm can hold their own against all comers; in fact they have been awarded several prizes for pre-eminence. Many very pretty designs were shown; while their poultry appliances, comprising houses, fencing, portable runs, hen and chicken coops, &c., testify to a considerable amount of ingenuity in arrangement and construction. We must not, however, overlook the articles specially suited to builders, contractors, &c., which form an important branch of Messrs. THOMAS & Co.'s business. The articles shown in this department were numerous, and included gravel and mason's sieves, lime-screens, straight wire-lattice for the protection of church windows, skylights, &c., corrugated diamond lattice for window guards, iron railings, &c., galvanised wire fans for window sills, gates, wire-netting, &c.

Messrs. S. & C. PHELPS, Sidney Sussex College, Cambridge, exhibited a few well-designed specimens for the following articles, viz.: A panel for a balcony, another for a gate or screen, and one for a stair-rail, besides a lamp bracket, a candelabrum, a scone, a pair of handles for a chest, and some hinges, door-handles, &c.

Messrs. W. RICHARDSON & Co., Darlington, sent several models of conservatories and greenhouses, showing their system of ventilation, &c., and an example of their improved span-roofed garden frame. A useful adjunct to the garden was also shown in a sample of a length of glazed wall-tree protector, 3 feet wide and another of 2 feet. Specimens of an excellent blind for greenhouses formed another feature, which was supplemented by a collection of boilers, &c., for different-sized greenhouses.

A collection of cabinet furniture for drawing, dining, and bed-rooms, and specimens of folding-chairs, tables, festoon blinds, &c., were exhibited by Messrs. W. H. VAUGHAN & Co., of Old Street, E.C. The firm are extensive manufacturers, and the designs and construction of most of the articles shown evinced considerable merit.

A large collection of weighing-machines were shown by those popular makers Messrs. DAVID HART & Co., Wenlock Road, City Road, prominent amongst them being their improved machine without loose weights, and which they adjust to the standard weights of any country. This machine has been extensively patronised and has been sanctioned by H.M. Officers of Customs for weighing goods in bond, &c.

The Patent Waterproof Paper and Canvas Company, Limited, of Willesden Junction, N.W., were present with their several specialties, an important one being their patent Willesden paper, which is claimed to be rot-proof as well as waterproof, and adaptable for all the purposes that felt is brought into requisition for.

A good collection of bricks was shown by the Finsbury Park Brick Manufacturing Co., Limited, Mavors Hill, Finsbury Park, N. The goods were of excellent colour and good make, and are said to be equal in quality to the best Suffolk.

The Imperial Stone Co., Limited, of East Greenwich, were not behind their competitors in artificial stone as regarded the quality of their exhibit. Their speciality is well known in the trade, and the specimens exhibited comprised, in addition to the Imperial stone, some excellent specimens of red concrete in balusters, caps, panelling, &c., with enamelled slabs in Imperial stone, sinks, &c.

Mr. G. DEARDS, Harlow, Essex, was again showing his

system of dry glazing. The principle of this, which was one of the first introduced to supersede putty, has been described before in our columns, so that we will merely mention that the bar is composed of two zinc tubes combined, resembling the letter X, in which the glass is placed, and upon which the zinc cap is afterwards made to slide. All is held firmly and securely down to the rafter by screws placed at various intervals. We need hardly remind our readers that Mr. DEARDS is also the inventor and patentee of heating apparatuses, prominent amongst them being that known as the Champion boiler, which has also before been referred to in *The Architect*; but this year he has introduced important improvements in the construction of his open fire coil grates, the result attained being the utilisation of the heat given out from the sides and back, which in ordinary cases is quite lost.

Mr. C. E. ZIMDARS, 327 Gray's Inn Road, W.C., and at New York, sends a variety of pneumatic bells, door catches, burglar and fire alarms, also similar appliances in which electricity is the motive agent; all of which appear to be well finished and of good workmanship.

Messrs. BROWNE & Co., 186 Piccadilly, had an assortment of gas cooking and warming stoves, including that known as the "Piccadilly" gas fire, which is cheap, simple, and portable, and suitable for small rooms.

Mr. JOSEPH WESTWOOD, jun., High Street, Bromley-by-Bow, E., made a useful exhibit with the different specimens of HAWKSLEY'S patent treads, flooring, &c.

Messrs. BOLDING & SONS, South Molton Street, had a spacious stand, which contained a good assortment of the goods for which they are noted, comprising baths, lavatories, flush-out closets of various kinds, and numerous hot and cold water fittings, hydrants, garden and fire hose, &c.

Messrs. ROBERT MORGAN & SON, Blackfriars Road, were represented by an exhibit that nowadays is of as much importance to builders as to engineers, for it contained beltings, laces, steam-packings, &c., the former being shown in both leather and cotton. They also had a speciality in the shape of an oil expressly for gas engines, which appears to possess useful properties.

The exhibit of Messrs. TREGGON & Co., York Works, Brewery Road, N., lost nothing by comparison with those of other firms in the same line of industry. Besides the many specimens of ornamental zinc work adapted to building uses, a number of useful appliances used by the builder and painter in his daily work were shown. The "Counterblast" cowl that has gained so much popularity was amongst the exhibits, and also a collection of galvanised cisterns, hot-water tanks, and oil drums, which have become an extensive item in the firm's output. A new use to which steel has been found applicable was shown in a bath formed entirely of sheet steel. As the material is very durable and light, we imagine steel baths will soon become extensively used.

A collection of wood chimneypieces, shown by Messrs. W. WALKER & SONS, of Bunhill Row, deservedly obtained a large amount of approbation, and fully maintained the reputation of the firm for this class of decoration. The woods comprised American walnut, mahogany, and stained oak; and a beautiful specimen for a drawing-room was in carved rosewood, inlaid with pearl. The mantelpieces were mostly supplemented with grates, kerbs, tile hearths, &c., which added greatly to the general effect.

Messrs. WILLIAMS & NASH, 9 Castle Street, Holborn, were one of the largest exhibitors of chimneypieces, their collection being of a most praiseworthy character. The marble chimneypieces comprised specimens from most of the best foreign quarries, and included many of very moderate price, as well as others of a more costly character. There was also a collection of specimens of English marbles, which, if they cannot vie in richness of vein with those of foreign extraction, have nevertheless points to recommend them. The firm also exhibited, in connection with the mantelpieces, a collection of handsome tile grates, hearths, marble kerbs, &c., of the style now in vogue.

Messrs. QUIRK, BARTON & Co., 61 Gracechurch Street, E.C., show their patent tin-lined lead pipe and tin-lined sheet lead, the special advantage of which is that it prevents poisoning, when substituted for ordinary lead.

The Art Tile, China, and Glass Painting Co., 39 City Road, E.C., had some very good designs in stained glass, leaded panels, hand-painted tiles for furniture, stoves, &c., and hand-painted china plaques, designs for church windows, &c.

Another firm who are exhibiting patent fibrous plaster decorations are Messrs. JACKSON & SONS, 49 Rathbone Place, W., and the specimens shown of ceiling work, cornices, &c., appear to be quite up to their usual standard; so also are some wooden mantelpieces ornamented with the material.

Messrs. CAMERON, AMBERY & Co., of 27 Little Britain, E.C., and New York—a firm who must have been well known to visitors to the hall, their specialities being useful to almost any trade, or, in fact, to anyone, whether for office or private use, who wish to lay their hands on correspondence, documents, &c., in the most ready manner—sent samples of their patent system of letter filing, including the "Peerless" cabinet letter files, which are handsomely made in black walnut and other woods.

Messrs. BROAD & Co., South Wharf, Paddington, are another firm who made a good display of various descriptions of moulded, facing, and other building bricks, roofing and paving tiles, slates, sanitary ware, &c.

Among stones, that known as Pennant stone, and quarried at Staple Hill, Bristol, by the Mangotsfield Pennant Stone Company (Limited), is worthy of note. The samples shown included two columns, respectively 4-inch and 12-inch diameter, an astragal-nosed step, bunched and pointed paving for street work, kerb and crossing-stones, &c. For the latter purpose it is extensively used in Bristol and surrounding towns, it being claimed for it that it is nearly as durable as granite, while it does not wear so slippery.

Messrs. ALEXANDER MCLEAN & Co., of 69 Belvedere Road, Lambeth, and other addresses, show samples of their improved KEENE'S and Parian cements, and artificial marble and polished mouldings made of the former; also flowers modelled in extra superfine KEENE'S and patent embossed tiles for wall decorations, and other purposes, in the same material; also Portland cements, plasters, &c.

Messrs. RITCHIE & Co., 23 St. Swithin's Lane, E.C., had an assortment of their heating, lighting, and ventilating gas-stoves that have been so extensively used during the past few years. Providing light and heat, they are useful appliances for halls, offices, conservatories, &c., and the arrangements for ventilating and neutralising the ill effects of the products of combustion are a great recommendation to them over a merely gas-heating stove.

An old-established firm, Messrs. JOHN HALL & SONS, 77 High Street, Marylebone, whose works are at Bristol, sent a large collection of glass, including the various kinds of window, stained and painted, cut-glass, glass tiles, ventilators, &c., and a large assortment of paints, colours, oils, varnishes, &c.

PARIS NOTES.

IN order to settle the question of cheap dwellings for the labouring classes in Paris and other French cities, a scheme (which now only awaits ratification by the Chambers) has been drawn up and agreed upon between the Government, the representatives of the city of Paris, and the Crédit Foncier. Six months ago little was heard about the subject. The Crédit Foncier engages to advance 20,000,000 francs on mortgage for the construction of small houses, costing from 3,000 to 10,000 francs apiece. The State will provide for the paying off of the loans, the builder having only the interest to pay. The whole is to be repaid within twenty years. The amount of subscriptions received from municipalities or private individuals will go to diminish the burden undertaken by the State; and in the case of departments or communes offering to guarantee interest, the advances made by the Crédit Foncier in the said department or commune will be assimilated to the existing communal loans. As regards buildings of several storeys, of which one half the interior space is let out in tenements of 150 francs to 300 francs rent, the Crédit Foncier is to be authorised to advance 65 per cent. of the value secured by a mortgage repayable in seventy-five years, on condition that the department or commune guarantees the annual payments. The city of Paris is likewise authorised to guarantee interest on a capital of 5,000,000 francs for the same purpose. The materials used in these buildings will be exempt from all octroi or road dues, while the land and houses will also for a period of twenty years be free from all State and municipal taxes.

With the approach of summer the question of the Paris water-supply is again coming to the front. The total amount now

distributed daily in the French capital for public service and private use is 400,000 cubic mètres. In a few months' time this will be raised to 450,000 cubic mètres, owing to the completion of new pumping machines. The position of affairs would be still more satisfactory if only the distribution in each district were proportional to the population, and to this end it has been decided to increase the supply in those quarters where it is at present insufficient. The works that will require to be undertaken for this purpose are estimated to cost 78,000,000 francs, including the purchase of new sources of supply, the necessary increase in the mains, and the construction of new reservoirs and pumping machines. Paris will then possess a daily supply equal to 800,000 cubic mètres.

As was to be anticipated, the gas company absolutely refuse to comply with the Prefectorial decree summoning them to lower the tariff 5 centimes per cubic mètre—from 30 centimes to 25 centimes. The matter will, therefore, have to be fought out before the law courts.

The managing committee of the Society of French Artists has decided that a register shall be opened in the secretary's office at the Salon, in which exhibitors may inscribe the selling price of their works. This book will be at the disposal of anyone desirous of consulting it.

It is announced that Clésinger's statue of Hoche—almost the last work of the deceased sculptor—which is destined for the open space in front of the Ecole Militaire, will be exhibited in this year's Salon.

The second annual Exhibition of Decorative Art was opened last Sunday at the Palais de l'Industrie. The exhibits are arranged in five sections: (1) Architecture, sculpture and decorative painting; (2) metal and goldsmiths' work; (3) tapestry; (4) ceramics, enamels and glass; (5) printing and publishing. In organising this annual exhibition the object of the Union Centrale des Arts Décoratifs has been to bring before the public the many interesting works by decorative and industrial artists, which, from the nature of their destination, are precluded from figuring in the Salon—strictly limited to the reception of paintings and statuary properly so-called. The exhibition, which last year was a great success, will remain open for upwards of two months.

"Japonism" has of late years become so fashionable, especially in Paris, that the success attending the "Exposition Retrospective de l'Art Japonais," now being held at M. Georges Petit's Gallery in the Rue de Sèze, is not to be wondered at. The exhibition, the proceeds of which will be handed over to the Union Centrale des Arts Décoratifs, has been excellently organised by M. Louis Gouse, director of the Gazette des Beaux-Arts and owner of an extensive collection, with the help of other amateurs. It affords specimens of every phase of Japanese art—paintings, lacquer, porcelain, and bronzes—all lent by private collectors.

M. Garnier, ex-consul of France at Shanghai, has left the whole of his fortune, amounting to about 400,000 francs, to the Académie des Inscriptions et Belles-Lettres, on condition that the revenue accruing therefrom shall be devoted to the equipment and sending out of expeditions for scientific research and exploration in Central Africa and Upper Asia. At a late meeting of the same Academy a letter was read from the Marquis of Lorne, inviting the Institute to send a representative to the second session of the Royal Society shortly to be held at Ottawa. The invitation was most warmly received, and the answer to be returned will be considered at the next meeting of the body. It may be noted that M. Xavier Marmier has just been appointed by the French Academy to represent it at the inauguration of the Canadian Academy at Montreal.

At the meeting of the Société Libre des Artistes Français, specially summoned to consider the encroachments threatened by the Senate on the Luxembourg Galleries, a resolution was passed praying "the Minister of Instruction and Fine Arts to resist the removal of any works until a suitable building has been prepared for their reception." It is probable that the proposal of M. Etienne Arago, director of the Museum, that the Orangery shall be fitted up and added to for the purpose, will be accepted as a compromise.

The Minister of Public Instruction and Fine Arts has signed a decree nominating the members of the juries for the National Triennial Exhibition of Painting and Sculpture, to be opened on September 15 next. The members of the Académie des Beaux-Arts form part of these bodies by right, and to them are added an

equal number of artists appointed by the Minister. The following is the list:—

Painting section.—MM. P. Baudry, Bonnat, Bouguereau, Boulanger, Cabanel, Cabat, Delaunay, Gérôme, Hebert, Lenepveu, Müller, Meissonnier, Fleury, Signol—members of the Academy. MM. Etienne Arago, Jules Breton, Français, Gruyer, Harpignies, Guillaumet, Henner, J. P. Laurens, Jules Lefebvre, P. Mantz, J. Moreau, P. de Chavannes, P. Rousseau de Tanzia—nominated by the Minister.

Sculpture section.—MM. Bonnassieux, Cavelier, Chaplain, Chapu, P. Dubois, Dumont, Falguère, Guillaume, Thomas—members of the Academy. MM. Barrias, David, de George, de la Planché, Frémiet, Hiolle, Mercié, de Ronchaud, Saglio—nominated by the Minister.

Architectural section.—MM. P. Abadie, Bailly, Ballu, C. Garnier, Ginain, Lesueur, Questel, Vaudremer—members of the Academy. MM. Boeswilwald, Brune, Alphand, J. André, Daumet, Litsch, Moyaux, Ruprich, Robert—nominated by the Minister.

Engraving section.—MM. Bertinot, François, Henriquel-Dupont—members of the Academy. MM. Delaborde, Gaillard, Hédouin—nominated by the Minister.

THE NEWLAND MILLS CHIMNEY.

A REPORT by Lieutenant-Colonel Seddon, R.E., who acted as assessor at the inquiry into the causes of the fall of the chimney of the Newland Mills, Bradford, has been forwarded to the Home Office. It is as follows:—

Construction of Chimney.

The chimney, which was built of stone, and about 85 yards high from the top to the foundations, about 10 feet below ground level, was erected between May 1862 and November 1863 under a contract between the late Sir H. W. Ripley and the firm of John Moulson and Sons, builders. The contract was to build an 85-yards octagon stone chimney, with a 9-feet internal flue, and 24-feet square at base, in every respect similar to a 60-yards chimney just completed by the same firm at the Ripley Dyeworks. Although at that time it was considered an exceptionally high chimney to build, its design was simply a repetition on a larger scale of other stone chimneys common to that part of the country. No professional advice appears to have been taken, and although certain plans got out for Sir H. W. Ripley by a firm of architects (Messrs. Andrews & Delaunay) were produced to the Court, they did not represent the chimney as actually built, according to the evidence laid before the Court, the late Sir H. W. Ripley acting as his own architect, employing a clerk of works, responsible solely to himself, to supervise the work.

Foundation of Chimney.

The site selected for the chimney was immediately over a filled-up coal-pit, which had been used in getting the coal from a seam known as the "Better-bed coal," about 30 inches thick, and at a depth of about 18 yards from the surface. The excavation for the foundations was 30 feet by 30 feet, and 14 feet deep through clay down to hard dark slate, which overlies the coal. From the bottom of this excavation the old coal-pit, which was either 8 feet by 6 feet, or 6 feet circular (according to different witnesses), was opened up, and round it were sunk four more 6-feet circular shafts down to the rock slating of the coal; the old headings were then walled up by packing dry rubble, wedged tight to roof and sides, with oak wedges, for a radial distance of about 6 yards from the centre of the old pit. These five shafts were then filled up from the coal slating to the foundation level about 15 yards, with lime concrete thrown in in a sufficiently liquid state to find its own level. A bed of lime concrete 30 feet by 30 feet by 2 feet 6 inches was then laid at the bottom of the excavation, and on this two courses of 12-inch ragstone footings (no stone under 40 feet super), the bottom course 28 feet by 28 feet, and the top course 26 feet by 26 feet.

Remarks on Foundations.

I had the chimney base bared down to the ragstone foundations, which, though they had never been brought to a level face, appeared to be perfectly sound and undisturbed, exhibiting practically no signs of settlement, for on levelling the quoins immediately above the foundations a difference of level of only three-quarters of an inch could be detected. This might have been due to a little want of care in the original setting out; but, in any case, it would hardly have thrown the top of the chimney 8 inches out of plumb, and could therefore have had nothing to do with its fall. This being the case, it was unnecessary to go lower down and to examine the concrete below the ragstone foundations. At the same time, the foundations prepared for carrying this chimney, the total weight of which may be taken at at least 3,600 tons, might be reasonably suspected to have been at fault, although, even if they

had yielded at any time, their ultimate condition was evidently not the cause of the accident.

It would be natural to suppose that the ground round an old coal-pit might be more or less disturbed, and its condition would not be improved by sinking four more shafts close around it; whilst the common lime concrete piers, formed by filling up these five shafts, could not be relied on to carry a weight which amounted to about 22½ tons per foot super, even when uniformly distributed over them, and to much more when the shaft was acted on by heavy winds. The use of furnace ashes in the concrete no doubt greatly improved the feeble setting properties of the lime employed; but the very liquid state in which it was thrown in would allow the water to drain out of it into the old coal workings below, carrying away much of the lime from the bases of the concrete piers.

There is always a great risk in building over old coal workings, however well packed they may be, and in the case of so weighty and lofty a structure, standing on so small a base, the results of any failure in which would entail most serious consequences, the right course would have been to have carried the entire structure down to the rock seating of the coal. That the foundations were not found to be at fault was probably due more to the soundness of the shale below than to the support of the concrete piers.

The base of the shaft as erected was a square of 24-feet sides, with the angles cut off so as to bring it to an irregular octagon with four faces of about 15½ feet, and four of about 6 feet each. At the ground line, about 10 feet above the base, it was brought to a regular octagon, and so continued to the top. Two flues ran into the base of the chimney: that on the east side was 6 feet from floor to crown of arch, and 5½ feet wide, whilst that on the west side was 7 feet from floor to crown of arch, and 6½ feet wide. The chimney flue was 9 feet 8 inches diameter at the base, working into 9 feet diameter a little above the midfeather, which ran up to a height of about 10 feet; from thence to the top the diameter of the flue was 9 feet. The shaft itself, which had an external face batter of about ¾ inch to a yard, was constructed as follows, up to about 30 feet from the base:—

1. An independent inner 9-inch ring of firebricks, built with one leader course to every three stretcher courses, and laid in fine-riddled lime mortar.

2. A 9½-inch ring of red bricks, consisting of leader courses alone (as far as could be seen, for there was only the lower 20 feet left standing), laid in fine-riddled lime mortar, and separated from the inner firebrick lining by a 6-inch air-space.

3. Filling or backing of common rough rubble work, laid and grouted in common backing mortar, the lime being unriddled.

4. An outer casing of dressed wall-stones, 6 inches to 7 inches deep on face, averaging about 6 inches on width of bed, and laid in fine-riddled lime mortar.

At a height of 30 feet from the foundations, 19 inches of solid red brickwork, resting on the top of the firebrick and red brick linings below, was carried up to the 38-yards level, whence it was continued 14½ inches thick up to a necking at the 74-yards level, from which point the rubble backing was omitted and the shaft was continued in solid brickwork with the wall-stone facing up to the seat of the ornamental stone capping. This was solidly put together with iron cramps, and apparently had no great projection besides being shaped so as not to offer much resistance to the wind.

From about the 40 yards level the same mortar was used in the rubble backing as in the outer and inner faces of the shaft. Right through bond stones, one on each of the octagon faces, and of the same thickness as the outer wallstones, were specified to be inserted at every 3 feet in height, extending from the outer face right through the rubble backing and half-way into the inner brick lining. It was stated that more than the specified number were put in.

When the chimney had reached a height of over 10 yards, Sir H. W. Ripley determined to ornament the shaft by sinking circular and long panels about 5 inches deep in each face of the octagon. Accordingly, commencing at a height of about 15 yards from the ground level, four rings of circular alternating with three of long panels were constructed on the outer face of the shaft. The building of the shaft commenced in July 1862, and went on till about the middle of December, when, frost coming on, it was covered up, its height being then about 40 yards. Work was begun again on February 28, 1863, and was again stopped on June 8, when just over 70 yards high, the chimney being found to be out of plumb about 3 feet at the top, though said to have been plumb when left the evening before.

A surveyor was at once sent for to ascertain accurately the lean of the shaft, and the results of his observations, as shown by drawings produced at the inquest, indicate that the lean was from the foundations, which appears to have been the general impression amongst the men employed on the work, owing to its having apparently gone out of plumb in the course of a single night. At the same time the description given to the Court by the foreman of masons was: "It was all right when we left at night. . . . When we came to look at it again it was bulged out at one side, and hollow on the other."

Again, another mason who went to work during the straighten-

ing process about to be described, says in his evidence: "It seemed to get out of plumb about 18 yards up the chimney."

Straightening Operations.

After the surveyor had fixed the extent and direction of the lean, a chimney-straightener of the name of Woodman (now dead) was sent for from Manchester. This man, who is said to have doctored a great many brick chimneys, but is not supposed to have been previously engaged on a stone chimney, straightened the shaft by cutting a slice out of it a little more than half-way round on the opposite side to the lean, and at a height of about 17 yards from the ground, of the same thickness as one of the courses of the facing stones (6 inches to 7 inches), replacing it by a course of flat bond stones passed half-way through from both the inside and outside of the shaft. This course was ¼ inch thinner than the course of wallstones removed, the reduced thickness being made up by iron wedges, which, when finally drawn, let the mass above them down on to the bond stones below. This operation brought the top of the shaft back about 18 inches out of the 3 feet, but not altogether in the direction desired. Accordingly, another similar cut was made about 3 feet higher up, which brought the shaft plumb.

It is important to mention here that in cutting out these two slices the external quoin stones were purposely left in to prevent the mass above coming over too suddenly, the result being that the outer casing was cracked and broken above and below those quoins for a considerable distance. The damaged portions of the outer casing were afterwards removed and made good, but without disturbing the backing by attempting to bond the new face work to it.

The operation of drawing the iron wedges, which took from three to six days for each cut, was thus described by one of the masons employed on it: "We had to use big hammers to move them, knocking the wedges from side to side. When we moved the wedges a bit it seemed as if men were striking a 40-horse-power boiler. That was the throgs breaking." The sound so described is not a single report, but a succession of reports dying away gradually. Another mason employed upon the straightening said: "I heard noises like the discharge of pistols." Nothing was done to the side of the shaft opposite to the cuts, though one of the witnesses stated that the joints on the opposite side of the shaft to the cuts showed signs of opening.

After the straightening the chimney was gone on with at once and completed.

Remarks on the Straightening.

Notwithstanding the surveyor's drawings and the general opinion expressed by the men employed on the work that the cause of the chimney leaning was a sudden giving of the foundations during the night of June 7, the evidence of a member of the firm employed in erecting it, and the description already quoted of the appearance of the shaft given by two of the masons, together with the fact that the spot selected for cutting into it was 17 yards to 18 yards above the ground level, all seem to point to the conclusion that the leaning over was not from the foundations, but rather from some distance above them.

All the witnesses, however, agreed in stating that the top of the shaft was 3 feet out of plumb, whilst the surveyor's plans confirm their evidence. Taking this to be the case, and also that the course replaced at each cut was only half inch thinner than that taken out, about which there was no difference of opinion, it is clear that there must have been considerable yielding somewhere for the shaft to have become plumb, as it would have required nearly 3 inches to be taken out at the level of the cuts to have brought the top of the shaft back a distance of 3 feet. Bearing this in mind, it is quite possible that the foundations may have been partly at fault, and that on the weight coming over they yielded slightly in the opposite direction, thus bringing them nearly level again, as they were found to be on the removal of the base of the shaft. The effect of making a cut 6 inches to 7 inches deep through the rough rubble hearting of the chimney, inserting the bond stones and wedges, meeting halfway through, and then drawing the wedges and letting the rubble hearting above down on the bond stones, was simply to break up the latter like biscuits, whilst, as the upper part of the shaft weighing about 2,000 tons gradually took its new bearing, the hearting would be shaken, and numbers of the throgs would break up with the loud reports described by the witnesses. Again, by leaving in the quoins to take the first shock of the weight as it came over, all bond between the outer casing and the hearting was destroyed for some distance both above and below the cuts. The opening of the joints on one side of the shaft was but the natural consequence of taking a slice out of the other side, and in regular courses down such as a brick chimney this could have been remedied by wedging up or removing a course of bricks and turning them on edge; but nothing of the kind being done in this case, the upper portion of the shaft, about 2,200 tons weight, would in every wind be liable to rock with disruptive effect, surely, however slowly, destroying all cohesion in masonry at and about that level, and especially in the unfortunate slice lying between the upper and lower cuts.

Lieut.-Colonel Seddon next gives a summary of the evidence of Mr. Moulson, which was published in *The Architect* in February.

Results of Inspecting the Ruins.

I first saw the ruins some days after the disaster, by which time most of the dead bodies had been recovered, and the débris had been cleared away from the actual site of the fallen mills; the yard, however, was filled with the wreck of the chimney to a depth of about 18 feet, completely covering up the portion of the base of the chimney still left standing. I was frequently on the ground during the removal of the débris round the base of the shaft, and carefully inspected the latter, as it was first cleared out down to the underground flues and then taken down piece by piece to the rag-stone foundations, which, as already stated, were found to be undisturbed and practically level. The débris was heaped up round the broken base of the shaft, just as would have occurred had it burst out as described at some distance up, and then the upper portion, crushing and being crushed, settled down vertically, and finally toppled over. The cap of the chimney lay in a cellar beneath the ruined mill, at a distance of about 120 feet from the base of the shaft, giving some idea of the length of the upper portion which finally fell across the mill. The débris consisted chiefly of loose stones of all shapes and sizes from the backing, and powdered mortar, mixed up with loose bricks from the inner lining and wallstones from the outer facing, some of the latter being firmly cemented together, and in many cases stained on the backs and in the joints with soot, which must have come through cracks in the backing. Whatever throughs there might have been were evidently broken up, as very few were found entire. Of the backing very few fragments remained so large as a cubic yard, and even these were ready to tumble to pieces, and in no case did I find any portion of the backing and the outer casing holding together. The backing mortar, where not reduced to powder, was full of large lumps of unslaked lime, and seemed to have been run in profusely, being often from 7 inches to 14 inches thick, one mass seen being quite a foot cube in bulk. In fact, as acknowledged by one of the witnesses, the rubble backing was regarded as mere filling-in between the inner and outer casings, and was composed of the commonest materials used. An exception, however, must be made with respect to the backing below the ground level, which was very sound and solid, requiring to be got out with picks and crowbars; the same mortar had been used as above ground (a pure lime mixed with furnace ashes and sand), but the stones were large and flat bedded, and the work not being exposed to the same vibration as above ground the mortar had had a better chance of setting hard.

The stones used in the outer casing were much too shallow on bed, and, having no proper connection with the backing, were of little use, except as regards appearance. The bricks used in the interior of the chimney were very good, but the condition of the inner firebrick lining in conjunction with the bulging of the outer stem would, had it been inspected, have shown that some serious settlement had been going on in the backing. It was very badly buckled and rent, the cracks being evidently of long standing.

Opinion on Causes of Failure, and Remarks.

The failure of this chimney was undoubtedly due to the damage done to the structure in the operation of straightening. The only wonder is that it survived that operation for twenty years. On cut would have been serious enough, but the second was fatal to the slice of masonry between the two cuts. The weight of the shaft above—at least 2,200 tons—giving a uniform pressure of 7 tons per foot super, rocking in every wind on this weak spot, slowly but surely disintegrated the masonry; the loose rubble backing, in yielding, threw the weight on the damaged outer casing and the inner brick lining, which latter stood on two independent single brick cylinders, 30 feet high, the inner one of firebrick exposed to all the heat of the ascending gases, and the other of red brick laid without any stretches, at any rate for the greater part of its height. The leaning of a chimney and cracks in the shaft would not be sufficient of themselves to cause any apprehensions of immediate danger in a district where the majority of the chimneys are more or less cracked, and many are considerably out of plumb; but, as it happened, those who examined this chimney were misled by a knowledge of its previous history into thinking that the rapid development of the cracks and bulges was merely due to the vibration of the chimney in the wind loosening the old portions of the outer casing which had been built up after the straightening without being tied into the backing, and which had again become loose and undergone similar repairs about sixteen years before. The chimney was in reality daily resting more and more on its outer skin, to remove which as decided was no doubt a fatal error. Before, however, this could be done piece after piece of the outer shell was pinched out, and the rocking of the shaft in the wind on the Wednesday night and Thursday morning completed the destruction of the chimney. A heavy gust came, and the damaged backing having lost the little tie previously afforded by the outer casing burst out, and all was over. It is easy to be wise after gaining experience, but the history of this chimney is so exceptional that I doubt if anyone would have anticipated any immediate danger. The cutting straight of brick chimneys is an operation of common occurrence, but I am not aware of any stone chimney, except this one and another close by, belonging to

Messrs. Sugden & Briggs' works, having been so treated. I unhesitatingly say that it was an operation which ought never to have been performed. The design of the chimney was radically bad in almost every particular, and, although the actual cause of its falling when it did was the damage done to it in straightening, I feel certain that even without that operation it could only have had a limited life, and unless taken down in time it would certainly have fallen some day or other. The system of constructing chimneys or any other walls to carry heavy weights of three or four different parts, each too weak in itself, and yet so put together that they cannot possibly work in unison, cannot be too strongly condemned, whilst the necessity in large chimneys for the firebrick lining being perfectly independent of the structural part of the shaft is now universally recognised. The fall of this chimney ought to be a warning in future to anyone who, dispensing with proper professional advice, takes upon himself the responsibility of carrying out works upon the safety of which the lives of so many may depend. Here we have a self-constituted architect and engineer, with a thoroughly bad design to begin with for an 85-yards chimney, in which the uniformly-distributed pressure at the base of the shaft would amount to over nine tons per foot super, first deciding, after getting about 10 yards above the ground line, to carry the shaft up to 100 yards instead of 85 yards, with the idea of making it look lighter (this was abandoned after the failure at 70 yards); and next weakening the structure considerably by inserting recessed panels all the way up to ornament the face, and that in spite of the advice of his builder to the contrary. It may not be out of place here to point out that there is a limit to the useful height of a chimney as regards draught; whilst the increase of draught due to increase of height is frequently more than counterbalanced by the losses due to sudden changes of direction in the underground flues and their want of gradual easing into the chimney, as well as by the unnecessary admission of cold air into the interior of the chimney. Looking to the possibility of there being other factory chimneys in a dangerous condition, as well as to the evidence of the Bradford Borough Surveyor as to the difficulty of getting to know of such cases, whilst he has no power to inspect such structures without some grounds to go upon, it is worthy of consideration whether the factory inspectors might not be empowered to make inquiries on this subject, and to report any cases which may come to their knowledge.

H. C. SEDDON, Lieutenant-Colonel R.E.

March 13, 1883.

GLASGOW CATHEDRAL.

SOME important additions have, says the *Glasgow Herald*, lately been made to the magnificent series of painted windows in our cathedral. Of these the two last erected form part of the series which adorns the clerestory of the choir. All the windows in the lower parts of the cathedral are now filled with painted glass, so that only those of the clerestory in the nave and choir remain to be filled, and of these the blanks are gradually being occupied. The subjects selected for the clerestory windows of the nave are the primogenitors of our Lord on the north side, and the prophets, evangelists, and apostles on the south side, whilst the clerestory windows of the choir are all set apart for the good women of the New Testament. The two new windows are part of this series—the one represents Lydia, Martha, and Dorcas, and is erected by Mr. Ewing, of Claremont Terrace, as a memorial of his father, the late Dean of Guild, and to his mother; the other window is also a triplet, and is erected in memory of the late John Kerr, writer, Glasgow, and his wife, by his children. The centre-light contains a figure of Elizabeth, and the two side-lights are filled with figures of Tryphena and Tryphosa, the lower portions of each having inscribed tablets, while the lower part of the centre-light is occupied with an ornamental panel containing the shield and armorials of the deceased. Both of these windows, like all the others in the clerestory, have been designed by Franz Fries, of Munich, one of the most notable artists of that school. They are fine examples of high art applied to the art of glass painting, and are wrought out with great clearness of detail and carefulness of finish, while the subjects are conceived and delineated with a greatness of manner and force of expression reached only in the best works of monumental art. We trust the few remaining windows will soon be filled and the scheme of decoration so far completed. When this is done attention may be drawn to the present unseemly paving of the nave and crypts. It may be also (should funds be forthcoming) that the decoration of both walls and ceilings will be included. Those who have seen the Sainte Chapelle at Paris will be able to realise the richness and beauty with which our noble cathedral may be fittingly endowed, and we doubt not but that, as in the past, donors will be found to continue and complete the good work which has thus far been successfully accomplished.

A New Congregational Church is about to be erected at Helensburgh from the designs of Mr. Honeyman, of Glasgow.

NOTES AND COMMENTS.

AN abstract of the conditions for the competition for the *Memorial of Victor Emmanuel* in Rome was published among the "Notes" on the 7th inst. It was proposed to erect the monument (which was to consist of an equestrian statue, an architectural background, and flights of steps) on the north side of the Capitoline Hill. But that site has been abandoned. The Municipal Commission of Archæology opposed the proposal, on the ground that around the hill associations which extended through many centuries had been clustered, and it would be an outrage to the memory of the king if they were obliterated in order to erect his monument. It was suggested that the spot where the statue of MARCUS AURELIUS stood was a more eligible site, provided no injury arose to the hill or to any ancient or mediæval remains which were to be found there. It was finally resolved that the most fitting homage to the memory of the late king was the preservation of everything relating to the history of Rome, and that historic monuments ought not to be sacrificed for the occasion. This resolve is worthy of Rome, and is a rebuke to that exuberant loyalty which is indifferent to everything outside the court circle.

THE judge of the Nottingham County Court lately reserved his decision in a case under the Employers' Liability Act, in order to consider whether a notice of intention to proceed with an action can be legally sent through the post-office. On Monday last an elaborate judgment was delivered, in which the judge said he was of opinion that the language of the Act did not preclude service by post in the ordinary way, but in that case it must be proved that the notice was received by the person to whom it was addressed. As His Honour was not satisfied with the defendant's denial that notice was received, he gave judgment for the plaintiff. Hitherto it was supposed that there must be manual service of the notice, or that it should be sent by a registered letter.

AN architect who has had nearly fifty years' experience in works at old mansions, has sent us some remarks on the subject of fires. He says he has known of old houses with flooring beams running fearlessly into chimney openings, which had nevertheless passed at least a couple of centuries unharmed. They succumb at last in a few hours, through the fixing of a new grate. In the old fireplaces, even so late as the time of the first GEORGE, the firebars were fixed at half a yard from the hearthstone. The chamber and flue were large and open, so that heat in either did not, in fact, could not, cause risk to the timber. It remained for the modern grate to bring the fire to the beam under the thin hearthstone, and to contract the old open funnel above into a furnace flue, which the wood (used so plentifully as bond in old work) could not resist. In some cases the same result has followed from careless work-people raking out their fire on to the hearth, often not more than an inch in thickness; but, so far as our correspondent's long experience goes, the alteration of the grate from an open old basket, well lifted above the floor level, to a close modern grate brought down nearly close to the hearthstone, has been the cause of nine-tenths of "the fires in ancient mansions."

IN the Nottingham municipal building competition 117 sets of designs were submitted. They were in the first place reduced to twenty. A small red star was affixed to each strainer of the twenty sets. Eventually the number was reduced to eight, which are described on another page, and the star was directed to be effaced from the unsuccessful twelve sets. The mark of the star on these latter is, however, clearly discernible, and it may afford some consolation to twelve of the competitors to learn that they were placed among the first twenty. Three names of architects will be suggested by the Corporation, and a majority of the eight competitors will decide who is to report on the second and final competition.

A PAPER on the Government Patent Bill, which is now before the House of Commons, was read by Mr. H. TRUEMAN WOOD at the Society of Arts, on Wednesday. The first defect was said to arise from the character of the controller, who was to be controlled by the Board of Trade and the law officers, instead of being a high official like the Commissioner of Patents in the United States. Objection was also raised to the clause which enjoins the definition of the inventor's claim on the first application. Experience shows that it is

only after the invention is fully described, and after a careful investigation into prior inventions, that a definite statement of claim is practicable. The Bill was also said to encourage fraudulent opposition, and the overthrow of a poor inventor by his wealthier rivals. The procedure for the extension of a patent will, if the Bill should become law, remain as it is now, but it is both expensive and precarious, and requires amendment. If a commission of experts presided over the Patent Office it would be a safer tribunal than the Privy Council. Other objections were raised, and the subject is to be again discussed on Tuesday next.

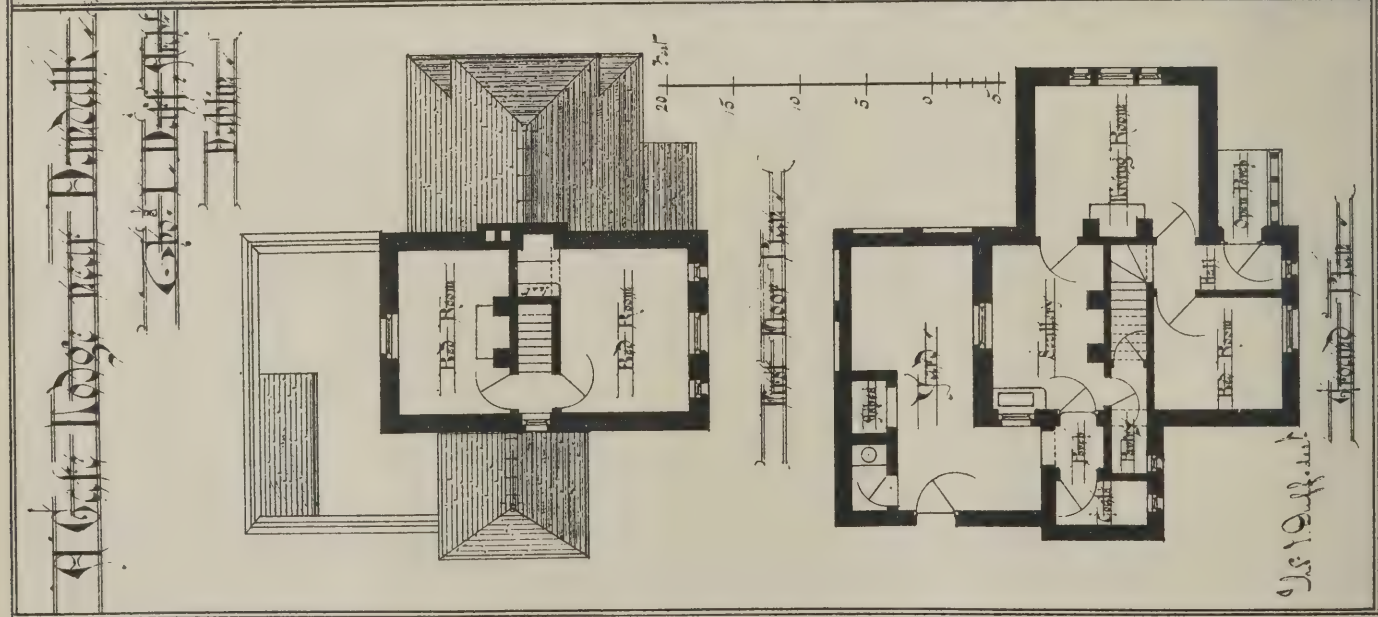

THE memorandum and articles of association of the National Smoke Abatement Institution have been published, and it may be assumed that the new society is likely to be enduring. The objects of the society are to promote the abatement of coal smoke and other noxious products of combustion in cities and other places, to check waste of coal, to continue and extend the work of the Smoke Abatement Committee by assisting invention, conducting trials, granting awards, establishing exhibitions, imparting information, &c. The income and property of the Society are to be applied solely towards the promotion of the objects of the Institution. We hope the Association may do well, although the constitution of the committees cannot be called representative. Among the thirty-six members of the first council there are only four architects, and we cannot discover an architect's name on the managing committee. The provinces have, or should have, a deep interest in the Institution; but with the exception of one member, the council and managing committee are inhabitants of the metropolis.

THE letter of Lieut.-Col. SEDDON upon the accident at the Bradford mill has induced the authorities of some of the neighbouring towns to investigate the extent of their powers for dealing with dangerous chimneys. In the Leeds Improvement Act of 1842 there is a clause which provides that if a chimney be in a ruinous or dangerous state, the Corporation may require the occupier or other person interested therein forthwith to take down, repair, rebuild, or otherwise secure the same to their satisfaction, and that if such occupier, or other person interested therein, shall not begin to take down or repair such chimney within the space of two days after such notice, and complete such taking down, &c., as soon as the nature of the case will admit, they themselves may, if any immediate danger is apprehended, cause the chimney to be forthwith taken down, shored up, or otherwise secured. There are further ample powers conferred by other local Acts. It is part of the duty of the building inspector of the Corporation to supervise the construction of chimneys, and lately he has compelled owners to alter chimneys which were supposed to be dangerous. Leeds would, therefore, appear to have provided against all contingencies, but there are other towns which have shown less foresight.

DURING the week the death of two notabilities has been announced. At the late archæological meeting at Carlisle Lord TALBOT DE MALAHIDE announced his intention of retiring from the presidency of the Royal Archæological Institute, but he was requested by the council to remain. Last week His Lordship died at Funchal. For half a century Lord TALBOT DE MALAHIDE rendered valuable services to archæology and science. In Ireland he was one of the very few men of position who were not ashamed to take pleasure in other matters besides field sports. The archæological societies and the Geological Society of Dublin were for years indebted to him for counsel and for the eager interest he displayed in the proceedings. But he was too little of a politician to be appreciated in Ireland. It will be difficult to discover a better president for an archæological association. Major-General SCOTT, who died on Monday, at Sydenham, like so many Royal Engineers, held civil offices. Since the death of Captain FOWKE he was the principal authority on everything relating to building at South Kensington, and he appears to have loyally carried out his predecessor's plans. General SCOTT, besides other appointments, was the secretary to the commissioners who have the disposal of the funds accruing from the Exhibition of 1851. We suppose his successor in the direction of the buildings at South Kensington will be a military officer, who will, as is customary, depend for his success on the skill of the civilian assistants.

ILLUSTRATIONS.

THE DISPUTE BETWEEN ATHENE AND NEPTUNE.

THE decorated panel from which this illustration has been taken was painted by M. MAZEROLLE for His Highness the Duc d'AUMALE. It was originally in the prince's house in Paris, but was afterwards removed by him to Chantilly. The same subject, it will be remembered, was selected for the sculpture in the western pediment of the Parthenon at Athens. The incident depicted is one of the oldest Greek legends. The city of CECROPS was placed by him under the protection of ATHENE as tutelary deity. But the distinction, which comprised the right of naming the city, was likewise claimed by NEPTUNE, and it was resolved at a council of the gods that the competitor who was able to endow the city with the more useful gift should become its patron. NEPTUNE struck the ground with his trident, and, according to one version of the legend, the sea rushed forth, while another says a horse was produced. M. MAZEROLLE has reconciled the variations by introducing a sea-horse. The olive-tree appeared at the bidding of MINERVA, and as the emblem of peace it was decreed to be the more suitable for a city in which the arts were to be pre-eminent, and Athens was henceforth associated with the name of the goddess. It would be impossible to represent the incident in such a way as to be satisfactory to modern notions of probability. A good deal must be taken on faith, and accordingly M. MAZEROLLE assumes that those who look on his picture will understand the difficulties of the subject, and will judge it, not by rules of logic, but by rules of art.

PAYING HARBOUR DUES AT BORDEAUX.

M. RUSKIN believes he has put the whole doctrine of free-trade into a few words when he advised nations to abolish their custom-houses. In Bordeaux in the sixteenth century they may have had no custom-house building, but none the less there were dues exacted. The officials shown in M. DUPAIN's picture evidently had a more pleasant life than their successors, who are compelled to transact business in stuffy rooms, and in the old days there was a more picturesque way of announcing that all formalities had been completed. The picture is based on local traditions, M. DUPAIN being a native of Bordeaux. The original work was exhibited at the Paris Salon.

DESIGN FOR MIDDLESBROUGH PUBLIC BUILDINGS.

THE designs sent in in competition for the above were submitted to the arbitration of Mr. ALFRED WATERHOUSE. The first premium was awarded to Mr. G. G. HOSKINS, F.R.I.B.A., of Darlington, whose design has been already published in *The Architect*; the second premium to Mr. J. R. NICHOLS, of the firm of Messrs. G. B. NICHOLS & SONS, Albert Buildings, Queen Victoria Street, London, E.C., and Handsworth, Birmingham, whose design we illustrate in our present number.

The town-hall, 146 feet by 83 feet, exclusive of the organ recess, occupies the whole frontage to Corporation Road, the principal entrance being in Albert Road, and the secondary entrance in Dunning Street. The drill-hall, kitchens, &c., are placed under the town-hall, and are approached from the courtyard and from Corporation Road. The free library and the municipal offices occupy the remaining frontage in Albert Road, the municipal entrance being in Russell Street, opening on to the grand corridor and grand staircase leading to the council chamber, 55 feet by 40 feet, School Board, rates, and municipal offices. The police-court, 55 feet by 40 feet and 25 feet high, is situated under the council chamber, with separate entrance from Dunning Street for the public. The police offices are in Dunning Street, together with the residences for the police superintendent and firemen, and the fire brigade establishment.

The plan throughout is so arranged as to allow abundance of light and air, and spacious and direct approach to every apartment, the town-hall itself being provided with specially capacious entrances to all parts of the floor and to the galleries, a corridor on each side of the hall giving access through three doors to the various parts of the floor. The clock tower—26 feet square—is situated at the corner of Albert Road and Corporation Road, and, with the spire, rises to a height of 200 feet. A second tower, with gabled roof and angle turret, marks the municipal entrance; and a sun-dial is shown on its southern face. The council chamber and police court are

lighted by boldly-arcaded windows, the council chamber and the town-hall being ventilated by light *flèches* covered with lead.

The style adopted is Early Geometrical. The building was intended to be faced with stone throughout, and the estimated cost was 70,000*l.* The design was very highly spoken of at the time in the local press.

ST. JOHN'S CHURCH, CATERHAM VALLEY, SURREY.

THIS church, recently consecrated by the Bishop of ROCHESTER, has been erected near the present terminus of the Caterham Valley branch of the South-Eastern Railway, for the use of a new parish which has lately been formed here. It consists of a nave five bays in length, with north and south aisles, a chancel of three bays with south aisle, and vestry and a north porch. Provision is also made for a tower at the west end.

The walls are built of Godstone stone, faced outside with Bargate stone in random courses, and inside with Reigate fire-stone, Bath and Reigate being used for the dressings. The roofs are pitch pine and Baltic fir, and are covered with Staffordshire tiles. The seats of the naves and aisles are executed in pitch pine, and the fittings in the chancel are all of wainscot oak. All the paving is laid with MINTON'S tiles, encaustic tiles being freely used in the chancel.

The font is an old one which once belonged to the old church at Caterham. The pulpit was a special gift, and is executed in stone and alabaster, elaborately carved. The richly-embroidered altar cloth, and the handsome brass eagle lectern, were also special gifts.

The plans of Mr. BASSETT-SMITH, of John Street, Adelphi, were selected in a limited competition, and the works, with the exception of the seating, have been satisfactorily carried out by Mr. CARRUTHERS, of Reigate, under the direction of the architect. The seating was executed by Messrs. G. M. HAMMER & Co., from the architect's designs.

A GATE LODGE NEAR DUNDALK.

AMONGST our illustrations of this week, we publish plans and a perspective view of a gate lodge near Dundalk, in the county of Louth. The external facings are of red brick, and the roofs are covered with Cumberland green countess slates. Mr. THOMAS J. DUFF, 14 Nelson Street, Dublin, is the architect.

DISTRICT SURVEYORS' ASSOCIATION.

A QUARTERLY general meeting of the District Surveyors' Association was held on the 13th inst., when Mr. Charles Fowler, F.R.I.B.A., who has resigned the office of honorary secretary, was presented with a testimonial on behalf of the members as a mark of their regard, as well as a slight acknowledgment of the great value of the services he had rendered them in the discharge of the duties of honorary secretary of the association for a period of twenty-one years.

Mr. Jennings, the chairman on the occasion, made the presentation. Mr. P'Anson, Professor Kerr, and Mr. Woodthorpe concurred in bearing testimony to the personal esteem in which Mr. Charles Fowler had ever been held by the members, to their appreciation of the excellence of his professional character, and the consistent manner in which he had stamped the work of the association with his own high standard of what was right and fitting their duties and responsibilities. Professor Donaldson, who was prevented by indisposition from being present, expressed by letter his high appreciation of Mr. Fowler.

Mr. Charles Fowler, in replying, reminded the members that he had succeeded one who had created the work of the association, and had placed it on a very high footing. If he had been able to maintain that work, it was mainly due to the kind assistance he had received from the members themselves. They had a highly technical and difficult Act to administer, and the principal object he had endeavoured to keep steadily in view before them was uniformity of practice, in the belief that the public interest is best served by a strict and uniform interpretation of the rules of the Act.

The Collection of architectural and other drawings by the late Mr. Allen E. Everitt, now on view at the Exhibition of the Royal Society of Artists, Birmingham, will soon be added to the Art Gallery, Mrs. Everitt having intimated her intention of presenting them to the town, in accordance with the wish of her late husband.

THE LEEDS ARCHITECTURAL SOCIETY ON COMPETITIONS.

WE have received the following communication :—

Sir,—Now that the Institute has decided to recommend in future the system of double competitions, our Leeds Architectural Society would be glad if you could find space for the circular forwarded by them to the Fellows of the Institute, which contains the reasons leading them to oppose the double competition plan as being a retrograde movement, and one that will seriously damage the position of the profession.

Did the Institute represent the opinion of the architects of this country, or had they even endeavoured to ascertain and follow the feelings of those for whom they profess to speak, our Society would have loyally accepted their decision, and have submitted with a good grace to the will of the majority. As long, though, as the Council of the Institute consists of eighteen metropolitan architects to four provincial ones, whilst the country architects outnumber the London ones by eight to one, they cannot be fairly held to speak with the voice of the profession; and our Society, with others, may honourably hold themselves free to openly oppose decisions made in the interests of a class, and wholly against those of their Fellows generally.

Yours obediently,

23 Park Row, Leeds :

J. WREGHITT CONNOR.

April 16, 1883.

To the President, Council, and Fellows of the Royal Institute of British Architects.

Gentlemen,—The question of architectural competitions, so long before you, will again form the chief item of business at the meeting of the Institute to be held on Monday, the 9th instant. On this occasion it is to be hoped the question, as far as the Institute is concerned, will be settled for some time to come. In the belief that the matter will not again, as so often previously, be adjourned, the Leeds Architectural Society ventures to bring the question once more before you, with the hope of being able to induce you to lend your aid and vote in assisting the Fellows who think with them in this matter to modify the "Suggestions for the Conduct of Architectural Competitions," so far, at least, as these are in favour of the system of double competitions. With this view the Society repeats the arguments laid before you some time ago, with such additional ones as experience of the system has brought to light. These objections are as follows :—

1. That the adoption of two competitions increases rather than diminishes the cost and labour entailed by the old system. Anyone acquainted with the conditions of the Glasgow and Birkenhead competitions, which may be taken as typical of those to be generally adopted in cases under the proposed system, must know that the preliminary sketches are practically as complete and entail as much labour as need be required to determine the order of merit without further trial. In both these cases, in the first competition, the conditions required plans of each floor, elevations of each front, two sections, and a perspective view. How many conditions of competition under the old system asked for more? Surely a competent professional referee could finally determine the position of competitors with so great an amount of information before him. Certainly an intelligent committee of non-professional men could; and it would be strange, indeed, if a member of our own body were less competent to understand drawings than the promoters of competitions themselves. With so much required in the first competition, it is impossible to avoid asking why a few shall be required to simply enlarge their drawings so as to make them clearer to the comprehension of one who ought to be able to understand them at first. It is thus impossible to avoid saying that double competitions benefit the professional referee alone, at the expense of the unfortunate competitors. In connection with this we would remind you that one of the most respected members of your Council drew up the conditions and settled the competitions for Over Darwen Town Hall. In this case all the drawings, with one exception, were made to a sixteenth scale, and only one more in number was required than in the instances given of Glasgow and Birkenhead; yet the professional referee was able to settle the competitions from these sketches with perfect satisfaction to the competitors. It is a proof that no possible reason exists for the second contest; and we feel most strongly that the influence of the Institute ought to be used towards making sketch competitions the only ones to be demanded by promoters.

2. That it increases the opportunities for the introduction of unfair influence on the part of favoured competitors. It is, of course, useless to conceal the fact that competitions are specially open to the employment of friendly or family influence on behalf of particular competitors. It is probably impossible to do anything that will materially check this; but, decidedly, there is no need for our profession to deliberately increase the opportunities for its use. Yet this is exactly what the proposed system would do, by doubling the chances a favoured candidate has for making his influence felt, should he get his design into the first selection. A condition in a recent competition of this character might have been framed expressly with such a purpose, as—by insisting on the

retention of the whole of the designs sent in until after the decision of the final competition—it gave to any competitor in this a chance, should he have power and disposition to do so, of inspecting the whole of the designs submitted, and benefiting thereby. It is with pain that our Society feels called upon to draw attention to this feature of the question, but it is useless to blind ourselves to the occasional imperfections in the conduct of fellow architects and promoters of competitions; and they must be considered as factors in the problems which you are striving to solve.

3. That double competitions are arranged entirely in favour of the promoters, without regard to the interests of architects. Even should the result of your deliberations be the recommendation of preliminary sketch designs of so rough a character and so few in number, as to really lessen the labour to be demanded from those taking part in the first competition, you have no power to force your suggestions on to promoters, who will never be satisfied with less than the preposterously great number of drawings (for a preliminary competition) required in the cases of Glasgow and Birkenhead. No exception can be taken to the promoters of competitions looking to their own interests, regardless of those of architects; but surely this might be left to them, and need not be assisted by the approval of the Royal Institute of British Architects.

4. That the proposed system lends itself specially to the greater use of hired draughtsmanship. If the adoption of double competitions has any specially pronounced tendency, it is that of increasing largely the number of those who participate in the first contest, and thus making competition work more speculative even than it is at present. As a natural result, principals with a practice keeping them reasonably well employed, would be tempted to compete through a skilful draughtsman for every contest of the kind, giving personal attention to the matter only when the chapter of accidents might have given the design thus prepared a place in second competition. The system is recommended on the ground that architects would give more personal attention to the competition drawings than they can do now; but a careful consideration of the question has led our society to take a completely contrary view.

5. That the proposed system, no more than the present one, can insure the employment of the successful competitor. This naturally must be conceded, for no promoters of competitions would bind themselves to accept as architect for the actual work, one whom they could not, or said they could not, trust in this position. What then would be attained as the result of this cumbrous system, that would double the work of the competitors, if the promoters declined or felt themselves unable to accept completely the decision of the referee?

6. That the adoption of double competitions would have a tendency to lower the remuneration to be paid as ordinary commissions. Possibly the effect the new system might have upon the outside public has not been properly considered, but it is fair to expect that our employers might reason somewhat in this way: "For works of considerable magnitude we have come to understand architects risking the labour and cost of one competition for the sake of the chance of securing a good commission, but we find them ready to incur that of two contests; perhaps they might be equally eager to risk that of three. Surely if the mere chance of five per cent. is sufficient to cover all this, the same commission must be far too great a sum to give for work placed in the hands of an architect without competition." Can it be denied that such a mode of reasoning would be a perfectly natural and logical one, and one that would not admit of an easy reply?

7. That the system encourages excessive competition. Few persons would be prepared to speak of the competition system, under any phase, as being a particularly desirable mode of obtaining commissions. It seems to be a necessary evil; one to be guided and rendered as little injurious as possible to the profession. Yet we find the adoption of preliminary competitions to have doubled or trebled the number of competitors, so far as we can judge by recent results. This can only mean a corresponding increase in the disappointments, the heart-burnings, the jealousies, the mental strain and wear, that are the natural accompaniments of keen rivalry. The mission of the Institute that stands at the head of our profession should be to check the indiscriminate and undignified scrambling for work characteristic of the age, rather than to lend its countenance and encouragement thereto.

8. That far more time has to be expended under the double competition method. This is so obvious that no more than the statement is needed to call attention to this phase of the question.

9. That the risk of failure on the part of promoters to carry out their intentions is largely increased. Everyone who has had to do with corporations or elective bodies knows how liable their building schemes are to collapse if the commencement be extended over the day of election, when dormant opposition may become active and overthrow the intentions of the party dominant at the time of competition. This risk, always present, would be exactly doubled wherever the system objected to by our Society was adopted. Too many architects have been the victims of this danger for this feature to require amplification.

No decision that our profession has ever been called upon to make has probably been of greater moment than this on the ques-

tion of double competitions, and our Society feels that in taking the course it has done, and in making this last protest against the possible adoption of the system, it has been defending the architectural profession against the most insidious attack that could have been made against it. One none the less dangerous because those who have made the proposal objected to have been actuated by pure and honourable motives. Our Society trusts that you will make an effort to be present on Monday, the 9th inst., and use your influence in obtaining the omission of paragraph (A) from clause 5 of "Suggestions for the Conduct of Architectural Competitions."

Signed on behalf of the Leeds Architectural Society,
JAMES B. M. FRASER, F.R.I.B.A.,
President.
J. WREGHITT CONNOR, F.R.I.B.A.,
Corresponding Member.

DRAWING IN FRANCE.

"THEY manage these things better in France" is a saying of Sterne, which is supposed to be especially applicable as regards instruction in art. But when one reads a recent article by M. Eugène Veron on the teaching of drawing, it would seem that so far as elementary and ordinary schools are concerned, there is not much difference between our neighbours and ourselves. M. Veron being a recognised authority, his utterances demand respect in France as well as outside it, and he is not likely to speak rashly. Accordingly, when he tells us that the teaching of drawing has been for a long time much neglected among his countrymen we are bound to believe him. There need be no stronger proof of the neglect than the fact that the smooth and pretty lithographs of Jullien, which were at one time admired in England, continue to be used as drawing copies. A better spirit is, however, about to prevail. Owing to the zeal of a few men, who may well be called patriotic, an energetic impulse has been given to art teaching in France. Better models are introduced, as well as improved methods. The official inspectors of drawing are zealously co-operating with the administration of the Beaux-Arts in endeavouring to remove existing defects. If the legislature will only comprehend the importance of the reform which is at work, and support it ungrudgingly, M. Veron is confident that the artistic industries of France will once more be supreme, and a part at least of the trade which has been taken by foreign competitors may be regained. But the Chamber, as at present constituted, is not favourable to the promotion of sound principles in art. M. Veron, however, founds his plea for support upon the material advantages which art can give to France. Those industries in which art is a factor are, he maintains, best adapted to the genius of the French people. By means of art, materials which cost little can become objects which are worth a high price. What is it, he asks, gives value to the works of his great countrymen Palissy, Gouthière, and Reisener? It is not the clay, metal, or wood used in their works, but rather the brain-power which was expended in the production. If the original cost of the materials be compared with the value of the works, the difference will express how much is owing to art. In no industry from which art is absent will the contrast be so great. This reasoning would be apparent to people who are only half-civilised, and the wonder is that it is necessary to have recourse to it in order to convince the authorities who control the destinies of France. In all countries, says M. Veron, prodigious efforts are being made to hold the position which once belonged exclusively to France, and at such a time her statesmen regard artistic pre-eminence as something vainglorious and unworthy of the attention of administrators who believe themselves to be in earnest. Seeing this, it surely is not high treason in M. Veron to desire that, before the art industries of France are ruined, the legislators who have a prejudice against art should give way to men with more generous sympathies, who are able to understand the needs of the present time.

In the meantime, M. Veron suggests that much will be gained if a better system of instruction in art is adopted in the elementary schools, and that this is feasible. If all children were enabled to draw as well as to write, those among them who were gifted with artistic power would somehow manifest themselves, to the great advantage of the art industries of the country. M. Veron proposes the introduction of an instrument invented by M. Gélibert, as a most efficient aid towards enabling children to draw. It is called the stigmograph, and it is employed to enable students to fix certain points on the paper before them which shall correspond with points in the drawing or model which is to be copied. In this way there is a possibility of a copy being produced resembling an original in proportion, which is not always the case at present. Everyone who has observed the early attempts of students is aware of the difficulty which is found in securing a regard for proportion. There will be generally the same parts in the copy as in the original, but in the majority of cases the relation between the parts is entirely different in the two. It is claimed for M. Gélibert's invention that it enables the student to obtain

precise data, which he can turn to account. Some will say that the student's eye is the true stigmograph, and that it is the aim of his training to enable him to judge of proportions. This may be true in cases where there is cleverness; but it often happens that the accuracy of eye which is necessary to judge of proportions is not to be attained without more time than many students can afford. If their labour could be lightened it would be an advantage. In literature and science study is made easier than it was, and there is no reason why similar facilities should not be given in art. M. Veron is of opinion that the new instrument enables a definite notion to be obtained of a figure, as well as of the relations of lines and planes in perspective, and the use of it is easily acquired. The stigmograph is not an instrument for mechanical copying like the pantograph; it simply enables the positions of points to be found, and the student must connect them according to his skill in freehand. The instrument costs only seven francs, and M. Veron proposes that it should be generally adopted in French schools. It would enable drawing to be practised where a drawing-master is not available. The best test of the stigmograph is practical use, and it will be easy for the administration of the Beaux-Arts to try a few experiments in public schools. In England it could also be tested without much cost to the public.

THE NOTTINGHAM MUNICIPAL BUILDINGS.

THE special committee of the Nottingham Town Council have selected eight designs, the authors of which will take part in the second competition. They are as follows: "Esto"—J. W. Hickson, 6 Exchange Street, Manchester; "J'espère"—Messrs. Truman & Pratt, Nottingham; "Suitability"—Charles Bell, 9 New Broad Street, London; "Light"—George Corson, 35 Cookridge Street, Leeds; "Order"—Yeoville Thomason, Bennett's Hill, Birmingham; "Might, Light, and Right"—Messrs. Verity & Hunt, 37 Regent Street, London; "Simplex"—W. Harvey, 7 Whitehall Place, London; "Childe Harold"—J. H. Oldham, 23 John Dalton Street, Manchester.

The following are the descriptions of their designs given by the above selected competitors:—

"Esto."

The interior of the building has not been sacrificed to any architectural vagaries, but depends for its effect on simplicity of arrangement, easy access to the different departments, good light, ventilation, and a general organisation of the whole. The principal and general entrance is in the centre of Sherwood Street frontage, the municipal entrance in Burton Street, the courts and police in Shakespeare Street, each having spacious staircases to the upper floors. On the basement facing Shakespeare Street are police and detectives' entrances, charge office, superintendent's residence and offices, warrant officers' rooms, search, parade, and constables' rooms, together with sixteen ordinary, and one large day cell. The cells are to be lighted and ventilated from the corridors, and access will be given to the prisoners' dock by staircases. In the department of the chief constable on the same floor will be a covered drill-shed, a large open yard, with mortuary, stabling, van-house, and sanitary accommodation. Both public stores and the heating apparatus are provided on the basement, so as to be in the control of the police. In the water department a general and three storerooms, an office, fitting and meter-takers' offices, and large open yard will be provided. For the gas department three storerooms, sulphur, laboratory, and photometer rooms, meter-taker's office, and yard will be provided. There will be a lighters' assembly room, and three large store-rooms. There are also a surveyors' store, and three spare rooms, with entrance and staircase from ground floor approached from the municipal quadrangle. Two staircases will be provided up and down from the gas and water corridors. In the department for the police facing Shakespeare Street, on the ground-floor, are a superintendent's residence, chief constable's office, and waiting-room, and offices for detectives; a messroom, storeroom, and lavatory. Approach to the courts above is obtained by public court stairs from this department, but a private entrance and staircase for the magistrates will be provided in Sherwood Street. An office is purposely placed next the chief constable's office for the water department, in which provision is made for a general clerk's office, inspector's offices, plan-room drawing office, spare and engineers' offices, and fireproof room adjoining telegraph office, all *en suite* and facing Sherwood Street, with staircases up and down. For the gas department, offices for the general clerks, manager, inspector, chief clerk, engineer, plan-room, and drawing-room, will all be provided *en suite*, with staircases up and down. Immediately facing the general entrance in Sherwood Street and the centre of the building is the finance office, properly divided for the receipt of rates, with fireproof-room and four collectors' rooms in connection. An office will be provided also for the lighting department. The offices for the borough surveyor and engineer will face Burton Street, and entering off from that are an inquiry and a waiting-room. Offices will be provided for the borough surveyor, chief clerk, estate surveyor, building surveyor, surveyors' general clerks, private improvement, accountant, private improve-

ment clerks and general clerks; drawing office, plan and contractors' room, all *en suite*, with lavatory and other accommodation, and staircases up and down. The municipal department will have the principal entrance from Burton Street, with a carriage entrance to a large quadrangle. On the first floor next to Sherwood and Shakespeare Streets will be provided police-courts and session-courts, with three retiring-rooms, robing-room, jury and refreshment rooms, and rooms for prisoners in waiting under each court; offices for warrants and summonses, fines and fees; solicitors' consultation-rooms, waiting-rooms for witnesses, large public hall, and staircase, and public corridor, and a grand jury or arbitration-room, all arranged in a convenient manner for the transaction of the general business. On the first floor will also be placed the offices for medical officer, chief inspector of nuisances and his clerks, surveyor's private offices and office for his clerks, all *en suite*. The council chamber, on the same floor, will face Burton Street and Sherwood Street, and will be provided with retiring rooms and waiting rooms, public and reporters' gallery, with separate staircase; one large and two smaller committee rooms; offices for the town clerk, a private and a waiting room; chief clerk's office, and waiting room; general clerks', estate clerks', stock and transfer clerks', conveyancing, registration, and election clerks', clerk of the peace and deputy clerk's offices, fireproof rooms and all the necessary offices. A grand staircase and two private staircases will connect this floor with the other floors. On the second floor it is proposed to provide offices for the School Board, and a store-room for the town clerk; a residence for the chief municipal porter, for the court's porter, and the office-keeper; while the public gallery in the council chamber may also be approached from this floor. Available extra rooms may here be obtained over the town clerk's office and magistrates' rooms if desired. It is proposed to heat the building, with the exception of the cells, by a large apparatus in the centre of the block on the basement, the hot air being carried through by pipes, the air being admitted to the offices and corridors by brass grids in the dados of the walls, &c. The whole of the offices will be provided with open fireplaces. The ventilation would be carried on by the ceiling ventilators, but the two courts and council chamber would be fitted with Boyle's patent air-pump ventilators. With regard to the lighting, it is proposed at a sufficient high level from the corridor floors to borrow light from the offices. Telephonic communication will be provided for. The estimated quantities are 3,479,065 cubic feet at 10d., giving a total of 144,9617.

"J Espere."

The police department is situated next to Shakespeare Street, having on the principal floor the courts and magistrates' departments, with public entrance from Shakespeare Street and private entrances in South Sherwood Street. The offices of the town clerk, borough accountant, and auditor are placed in Burton Street, the council chamber and committee being placed just over these, with a large entrance from Burton Street. The town clerk's strong rooms and stores are placed in easy access to the committee-rooms, being provided with fireproof protection. The gas, water, and rates' departments are placed in the central block on the principal floor, with a large central entrance from South Sherwood Street, the whole having a large and spacious hall, from which the various offices radiate. The health department is placed in the central block on the ground floor. The borough engineer's office and the School Board offices are placed in the central block on the first floor, with an entrance from Sherwood Street. Plenty of space has been provided, the corridors being 13 feet wide. The material used will be Darley Dale stone for the exterior walls, and brick for the interior. The floor and ceilings will be on the Dennett system, and the roof of wrought iron, covered with slates. An arrangement will be made by which the central block and the wings can be shut off from each other by iron revolving shutters in case of fire. The corridors, halls, &c., are to be paved with marble mosaic, and the walls to have a dado of majolica tiles. The cost, including everything but the furniture of the buildings, is estimated at 90,000*l*.

"Suitability"

arranges the several departments as follows: The police department to be on the north side, entered from Shakespeare Street; the municipal department, entered from Burton Street; and the general public offices entered from the centre of South Sherwood Street. The municipal block has a spacious entrance from Burton Street into a large vestibule, the corridors here being 10 feet wide. On the ground floor are placed the whole of the town clerk's offices and rooms. In the basement are the muniment and store-rooms, the assembly-rooms, and store-rooms for the gas-lighters, and a covered shelter in the rear on a level with the courtyard. The council chamber, and other rooms connected with it, are on the first floor, reached by a double staircase 30 feet wide, which would be enclosed by iron gates when not used by the council. The chamber is 80 feet by 36 feet, with a height of 33 feet. The adjoining rooms include a reception-room, library, mayor's parlour, and robing-rooms. The various committee-rooms, with waiting, retiring-rooms, and lavatories, are grouped round the grand loggia. Public accommodation in the council chamber is given by a gallery over the vestibule. Care is taken to insure

perfect quiet in the chamber and its attendant rooms. The borough surveyor's department is placed on the first floor, extending along the whole of the Sherwood Street frontage, and is reached by a staircase, 8 feet wide, from the main entrance. The School Board offices are above the surveyor's offices, the staircase being of the same width and style; and the board-room occupies a fine position at the angle next to Shakespeare Street. The auditors' rooms, some spare offices, and caretakers' rooms are also provided on this floor. The gas, water, and general rates offices occupy the ground floor, with a wide public hall opening from the main entrance, 30 feet in width and 60 feet in length. In the basement, below these offices, are store-rooms, access being obtained both by staircases and a wide cartway from Burton Street, by which all heavy stores could be taken in. On the right of the main entrance will be placed the accountants' offices, each in communication with the other, and also with the town clerk's offices. On the left of the main entrance are the health and medical officers' departments, the object in this arrangement being to provide all the offices frequently visited by the public on the ground floor. The police department occupies the whole of the Shakespeare Street and a part of the South Sherwood Street frontage, having a charge-room, on a level with the street, sixteen cells, and rooms for police stores. The courtyard in the rear is spacious, and contains a covered drill-shed, while a stable for five horses and carriage-house is also provided. An entrance for magistrates is provided in connection with their court and also with their rooms. The courts are on the principal floor, being placed at the rear to secure quietude; the principal entrance will be from Shakespeare Street. The grand jury and arbitration rooms will be provided with suitable ante and retiring-rooms. The ventilation would be as far as possible that of the natural process, but wherever direct ventilation could not be carried out the Æolus Waterspray System, by which the air is purified, would be adopted. The warming would be by smoke-consuming grates in all ordinary rooms, and by hot-water pipes in all the corridors, courts, and council chamber. The general architectural style of the building is proposed to be Renaissance, somewhat after the character of the Hôtel de Ville, Paris, a style said to be very suitable for the requirements. At the main entrance in Sherwood Street would be a clock tower with carillon; the council staircase might be crowned with an answering feature, while the corners of the building at Shakespeare Street would naturally come in for some bold and appropriate treatment. For materials it is thought no better effect could be produced than by the use of Nottingham red pressed brick for flat spaces, the cornices, &c., being in Ancaster or Mansfield stone. The roofs would be of green slate. All the corridors would be lined with glazed bricks in suitable colours; while the floors of the council loggia would be of marble mosaic, the main corridors being laid with a cheaper kind. The joinery of the principal rooms would be of oak or walnut. The cubical contents of the building are estimated at 2,944,699 feet, with an average price of 10*s*.d. per foot, giving a total of 124,510*l*., which, with 3,500*l*. extra for fittings, gives 128,010*l*. for the whole work.

"Light"

in his specification says: "I have placed the council chamber, together with the committee rooms and the town clerk's offices, in a block at the higher end of the site next to Burton Street; the police offices, courts, and magistrates' rooms in a block at the lower end fronting to Shakespeare Street, each block having return frontages to Sherwood Street, which is utilised for the general offices; while at the back of the centre a large block is placed containing the gas, water, and general rate offices. Between each of the end blocks and the back centre blocks I have placed courts for light and air, containing 5,076 and 4,960 superficial feet. There is a covered court for a drill-yard for constables. The offices I have mentioned at the Burton Street end will be entered without the aid of steps, while the fall of ground from Burton Street to Shakespeare Street (fully 20 feet) I have utilised for police accommodation. The entrance to the police office is at Shakespeare Street, and is on the level; there is also a carriage entrance to the detective offices. The police and magistrates' courts, each 60 feet by 40 feet, are parallel, but separated by a court for light and air, and placed away from the street. The space beneath the courts is used for store-rooms, sick-rooms, and rooms for persons awaiting trial. Fronting Shakespeare Street are the magistrates' rooms, with a private entrance. Under the retiring-room for the witnesses is a retiring-room for the jury, with a staircase leading direct from the box. A private passage is provided between the two courts, and accommodation will be given to the magistrates' clerks at the South Sherwood Street corner of the block, together with offices for fines, warrants, and summonses. Two rooms fronting Sherwood Street will be provided for solicitors, and over the rooms for the magistrates' clerks will be placed the grand jury room. Galleries for the public will be provided, and access given from Shakespeare Street. A superintendent's office will be provided on a level with the lock-up, together with domestic offices. Cells and a day cell will be provided, ventilation being given from the police-yard. The usual offices and store-rooms for the police will also be provided here. The chamber will have an area of 2,600 feet, and will have

separate entrances for the public, the councillors, and the mayor. Galleries are provided for the public and reporters; a retiring-room also being provided for the latter. A robing-room for the councillors, a parlour for the mayor, and a spare room which can be used to receive deputations all adjoin the council chamber. A library, a waiting-room, and two spare committee-rooms are also included; besides three regular committee-rooms, with two waiting-rooms, which are placed on the first floor. These committee-rooms are connected with the council chamber by a private stair, and by another staircase to the glazed court for shelter. The offices of the town clerk stretch along the frontage in Sherwood Street, the working offices being shut off from the public. The office of the stocks and transfer clerk is placed next the central entrance from South Sherwood Street, and has a waiting and a strong-room. The estate and conveyancing clerks have their offices placed next to the council-block entrance. The town clerk's office adjoins the inquiry office, and, together with his private room, has a waiting-room adjoining. Rooms will be provided for the chief clerk and the election clerk, together with a store-room for election requisites. Underneath the town clerk's office, in the basement, are placed store-rooms and fireproof rooms, with a hoist and a private staircase. A caretaker's residence is provided at the back of the council block. The borough accountant's offices are placed to the left of the main central entrance, and comprise, in addition to the three offices required, a waiting-room and strong-room. The offices of the health department are beneath the borough accountant's, entrance being given from the street for the public and the inspectors. A waiting and store-room are also provided. The offices of the lighting department are placed under those of the transfer clerk, and have an entrance at the street, level to the right of the main entrance. Behind the office is an assembly-room for the lighters. Immediately opposite to the main central entrance are the money-receiving departments, the water offices to the right, the general rate office to the left, and the gas offices in the centre at the back. In the water department, offices will be provided for clerks, inspectors, and managers, while store-rooms will be provided for them in the basement. Upon the basement level are two offices for testing meters and fittings. The general rates office will have an area of 2,505 square feet, and will be divided into the four requisite portions. The offices of the collectors will be placed at the left of the general rates office, and will be provided with a strong-room. Extra rooms may also be provided here. The gas office will have an area of 7,495 feet, well lighted; and besides this general office are offices for the manager and meter-takers, rooms for the photometer and fireproof stores, while the engineer's office will be in direct communication. The borough engineer's and surveyor's offices are placed on the first floor, facing Sherwood Street. The auditors' room is also placed on the first floor. A house for a caretaker is provided. The School Board offices occupy the remainder of the frontage to Sherwood Street, and a portion of the frontage to Burton Street. They have a separate entrance, and the area is 5,718 feet. The offices, courts, and council chamber will be heated by hot air; the ventilation, for the most part, will be obtained by means of the roof, and in the case of the courts and chamber by Boyle's patent exhaust ventilator. The buildings are planned to admit of a simple treatment of the Italian style. The corridors will be rendered fireproof. The material I propose is brick, with a roof of Westmoreland slate; and I estimate the sum required at 157,883*l.* 9*s.* 9*d.*"

"Order."

The suggestion set forth in the instructions that the municipal offices should front Burton Street, &c., has been adopted, and the same has been followed with regard to the gas, water, and police, &c. In grouping the various departments, the council chamber takes the first place. This, with the rooms belonging to it, has been so arranged that it is complete in itself (placed on the first floor), and planned so that no portion is a passage way or in a corridor leading to other departments. The plans generally may be said to consist of three great divisions, with courtyards between them, the gateways to the courtyards forming the boundaries of each division. The principal, or first division, contains: In the basement—town clerk's department, borough engineer, health department, and office-keeper. Ground floor—borough accountant, borough engineer, and health department. First floor—council chamber, committee rooms, town clerk's offices. Second floor—town clerk's offices, borough engineer. The second division contains: Basement—gas offices, water offices, lighting. Ground floor—gas offices, water offices, rate department. First floor—gas offices, water offices. Second floor—School Board offices. The third division: Basement—police department. Ground floor—police department. First and second floors—magistrates' departments. The style contemplated is a free adaptation of the Renaissance, to be worked in brick and stone, the estimated total cost being 121,225*l.*

"Might, Light, and Right."

The building forms three great blocks connected by spacious corridors, by two large courtyards for light and air, which also will be used for a police yard and carriage way. The municipal offices are entered from Burton Street; the gas, water, and finance offices

from the level of the centre of South Sherwood Street; and the police from the level of Shakespeare Street. The principal entrance leads to a large hall giving access to all parts of the building. The council chamber is placed on the first floor of the Burton Street block, and has two entrances, one from the hall and one from the courtyard. Rooms are provided for the mayor and for deputations, &c. The chamber is semicircular in form, with a raised dais for the mayor, and a gallery at the back for the public, having a separate entrance from Burton Street. A reporters' gallery is also provided. Several rooms are provided on the same floor as the council chamber, to be used as committee-rooms. The town clerk's private office and secretary's office are placed on the same floor next to the committee-rooms. The other offices of the department are placed on the level of the Burton Street entrance in direct communication with the town clerk's room by a private staircase. Beneath these offices are offices for registration clerks, stores for election requisites and fireproof rooms. The offices for the clerk of the peace and his deputy have been placed on the level of the town clerk's, but nearer the courts. The offices for the borough engineer and surveyor extend from the centre to the north block on the council floor, and will include the usual drawing and plan rooms, &c. The borough accountant's office is placed on the ground level of the council chamber block. The offices for the health department are placed on the level of the main entrance in Sherwood Street. The general office for the gas department is one large office at the east and north of the central block. The engineer's and other offices in connection with this department are placed on the upper floor, strong rooms being provided on all the floors. The meter-takers' and photometer rooms are provided in the basement. The water department office is on the south side of the central block, and has ample accommodation for the clerks and workmen, as well as for store-rooms and fittings. The pay-office is a large and handsome room right in the heart of the building, and entered by the public from the central hall. It is in connection with the gas and water offices. The offices of the lighting department are placed on the lower floor next the gas stores. The department for the magistrates occupies the upper portion of the Shakespeare Street block. The courts are placed side by side on the first floor, the police offices occupying the lower floor. The public entrance in from Sherwood Street, while a separate entrance is to be provided for the magistrates to each court. The public are admitted to galleries, and only those actually engaged are admitted to the body of the court. The courts are lighted both by skylights and windows. Waiting-rooms, robing-rooms, and the usual offices for clerks will be provided in close connection with the court. The grand jury-room is placed on the principal floor on a level with the council-room, and it may be used as an extra court if desired. The police establishment occupies the whole of the ground floor on the north block, and comprises a charge-room, parade-room, superintendent's house and office, detectives' offices, and twenty-four cells, together with waiting-rooms for the prisoners. In the basement are stores and lamp-rooms; a mess-room, lavatories for the men, and a room for the constable in charge. The School Board offices are placed in a separate block on the east side of the Burton Street block, but in easy communication with the municipal offices, the entrance being under cover leading to the courtyard. Sample-rooms, stores, inspectors' office, and a spare office are on the ground floor, while the clerk's offices, writing-room, general visitors' office are on the first floor, and the board-room and other offices on the upper floor. Two offices are provided for the borough auditors in a mezzanine above the borough accountant's office, approached by a private staircase from the south hall. Office keeper's residence, spare room, &c., are provided in the upper storey. The external façades would be of red Mansfield, and the walls of ordinary brick; the style of architecture would be the Renaissance. The warming of the place would be carried out by means of hot air, and the ventilation by a supply of air through channels under the floors, the vitiated air being expelled through the ceilings. Care would be taken to make use of fire-resisting material; and in addition it is proposed to construct an iron water-tank on the top of the extracting shaft. The cost is estimated as follows: For 3,321,258 cubic feet at 8*d.*, 110,708*l.*; for stone fronting, 5,000*l.*; fixtures, 5,000*l.*; roads, drains, &c., 2,000*l.* Total, 124,708*l.*

"Simplex."

The principal entrance has been placed in the centre of Sherwood Street, giving direct access by the grand staircase to the council chamber and principal committee-rooms on the first floor, and communicating by spacious direct corridors with the several departments on the ground floor. Another principal entrance is placed in Burton Street, which gives immediate access to the gas and water departments on the ground floor, and by a large staircase to the School Board and other offices on the first floor. The police department, courts, &c., have been placed next to Shakespeare Street, with separate entrances for the police and detective departments. A roadway, 18 feet in width, leads to the drill-yard at the back, and would serve for the use of the prison vans, &c. The public entrance to the courts is at the corner of Sherwood Street, leading by a direct staircase, 10 feet wide, to the courts on the first floor. A separate private entrance, and staircase adjoin-

ing, is provided for the use of the magistrates. The police-courts are placed on the first floor, and have two tiers of cells underneath communicating directly with the prisoners' docks. The rate offices are immediately accessible from the principal entrance in Sherwood Street, as also are the medical officer's, borough accountant's, and water department's offices. The gas department is placed on the Burton Street front, by which large accommodation is readily afforded. A roadway for carriages, 18 feet wide, leads from the Burton Street entrance to a glazed shelter. The council chamber on the first floor is designed with a special view to the ready accommodation and comfort of the members. It has three tiers of seats and gangways for the councillors, and accommodation for the mayor and aldermen. A gallery for the public, with a special entrance, is provided at the back, while a reporters' gallery is placed over the above at the back of the mayor and aldermen. The town clerk's department is on the first floor of the Sherwood Street front, and underneath is a mezzanine floor, where a portion of his staff could be accommodated. The borough engineer's department is also on the first floor, immediately adjoining the committee-rooms. The style adopted would be Classic, the elevations depending more for their effect upon the massing and proportion of the several blocks than on any elaborate details. The materials for the fronts would be brick, with Hollington and Darley Dale stone dressings. The quantities required are estimated at 3,540,350 cubic feet, at 7d. per foot, 103,259s.; glass roofing, 1,044s.; excavations, &c., 3,000s.; paving to courts, 2,000s.; fittings, 7,500s., making a total of 143,803s.

"Childe Harold."

The peculiarity of the site by its great fall has suggested the grouping of different blocks of offices. The council chamber (which will be larger than the Manchester and much larger than the Leicester chamber) will have two large and one small retiring-rooms. Four committee-rooms will be provided on the same level. On the first-floor level will be provided offices (seven in number) for the town clerk and his staff, an office for the clerk of the peace and deputy, besides store-rooms, fireproof-rooms, waiting-rooms, and inquiry-office. Upon the first-floor level, approached either from Burton Street or Sherwood Street, principal entrances are placed. The offices for the borough engineer and the surveyor are situated on the first floor, the second floor, and the basement, and comprise seven offices for clerks, a large drawing office, a general office, a plan and contractors' room, and a room in the basement for stores. The borough accountant's offices are situated at the south end of Sherwood Street, and consist of three offices and a fireproof-room. Near this are arranged the rooms for the auditors. The offices for the department of health are arranged to front Burton Street, and will consist of five rooms. The gas offices consist of eleven rooms, the general office being on the ground-floor, with an entrance from the spacious central hall. Store-rooms will be provided in the basement, while the clerks' rooms will be situated on the first and second floors. The offices of the water department will be entered from the north side of the entrance-hall in Sherwood Street, where they are arranged. Ten offices will be provided on the ground and first floor, while store-rooms and fireproof-rooms will be provided in the basement. The rate offices will occupy the southerly side of the entrance-hall from Sherwood Street, and will comprise 2,500 feet. Three offices will be provided for the collectors. The lighting department is arranged next to the carriage-entrance in Burton Street, and contains an office and store and assembly-rooms for the lighters. The magistrates' department will contain two courts, a grand jury room, the usual cells and police offices, offices for magistrates' clerks, &c. Both a public and a private entrance are provided for the courts. The police establishment will contain eight offices for constables, detectives, and clerks, a charge-room, parade-room, store-room, cellar, and corridors communicating with the courts. A superintendent's house fronting Sherwood Street will also be provided. The accommodation for the School Board will be provided in the portion fronting Shakespeare Street, with a separate entrance. On the ground floor will be the visitors' office and waiting-room, while the board-room and all the other offices will be on the first floor. The estimated cost is 115,000s., but if fireproof construction is desired 10,000s. must be added.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of this Association was held on Wednesday, the president, Mr. MacGibbon, in the chair. After the preliminary business, the chairman introduced Mr. John Marshall, M.A., Edin. and Oxon, Rector of the Royal High School, who proceeded to read a paper entitled "Amateur House Decoration, with some Notes of Personal Experience." The speaker explained that the purport of this lecture was to enforce the value of the lay element in the decoration of our houses. Two tendencies—both bad—generally have the field between them in this matter. The one, prejudice and tradition among the public; the other, theory and routine among professional decorators. Salvation from the first comes through teachableness, humility, readiness to believe that there may be good outside what is merely

usual; salvation from the second comes through willingness to recognise the claims of individual character and individual necessities, not merely as justifying certain deviations from the theoretically best, but as themselves containing higher artistic possibilities when wisely used than can be got out of any merely theoretical rules of art. A beautiful house, like a beautiful painting or other work of art, must express not merely general law, but also individual character, and the special note of its excellence depends chiefly on the latter; and in a house, whose function to begin with is, to be lived in, the character expressed in its decoration must be largely that of its inhabitants if it is to be really interesting. The function of the professional decorator is not to impose something entirely alien upon his public, but rather through sympathy to elicit the latent individuality in them, to get at their true wills, often very inadequately expressible in words, and so to fashion a new work of art which shall be his in the best sense, because it is the expression of himself through continually fresh suggestion. Only in this way can the decorator escape staleness and hackneyed mannerism. So far, therefore, as any so-called æsthetic movement implies merely the substitution of a new fashion, or a new rule for an obsolete fashion or rule, so far is it inartistic and worthless. The only value of such a movement consists in the amount of stimulus which it may give either decorators or laymen to study, and think, and feel for themselves. Any great innovator usually does give such an impulse to the sensitive few; for the many he only adds another fashion with no vitality in it, a mere mannerism the more to fill our museums with curios and our houses with eccentricity. A house "furnished throughout" on it matters not what system, or at what cost, is bound to be a failure, for it cannot but lack the vital spark which comes from relation to real human feeling and individual human lives.

The lecture was listened to with marked attention throughout, and a cordial vote of thanks was accorded to Mr. Marshall. It was intimated that the next Saturday excursion would, owing to the kindness of Sir J. Hope, Bart., Lord Elphinstone, and the tutors of Sir G. Grant Suttie, Bart., be to Pike House, Carberry and Elphinstone Towers, and Fallside Castle.

ITALY FROM AN ARCHITECTURAL POINT OF VIEW.*

By F. T. BAGGALLAY.

(Continued from page 257.)

Porches.

THE porches to which I referred in the early part of this paper, notwithstanding that they transgress in almost every particular the traditions which we hold, are, nevertheless, objects of the greatest beauty and interest; indeed, in many instances the architects seem to have relied upon them for the whole effect of their fronts. The essential features are an arch, or rather a short section of a barrel-vault, projecting from the wall and resting on columns, having an iron tie-rod to resist the thrust, and the columns resting on the backs of symbolical animals—usually lions' or griffons. Sometimes, as at Ancona Cathedral, and at St. Zeno at Verona, the gabled roof is simply (so to speak) fitted over the arch; but more commonly there is a second storey either of another single arch, as at Verona, Piacenza, and Parma cathedrals, or of three, as at Sta. Maria Maggiore at Bergamo (of which there is a sketch in "Brick and Marble Architecture") and the south porch of Modena Cathedral. The upper storey was evidently intended as a niche for statuary, possibly for a statue of the founder, and in some cases is so used. The whole structure is generally of marble, the lovely colours of which, combined with the simplicity of design, the dignity and significance of the animals which support it, and the beauty of the carving which usually decorates it, causes the spectator to forget, or, at least, to forgive, its structural absurdities. One of the best, perhaps quite the best, of these porches is that at the west entrance of Ferrara Cathedral. It is built on the backs of a couple of conventional lions; the lower storey is exactly the usual thing, but the upper one has the three pointed arches on the front filled with tracery and resting on chevroned columns, while above the arches runs a deep frieze, representing, if I recollect rightly, the "Last Judgment," and the whole is crowned by a sculptured gable or pediment, with smaller gables facing the ends. In the four spandrels of the upper storey are the symbols of the Evangelists, and under the centre arch a figure of the Madonna and Child. It is as suggestive a design as I have seen anywhere, and far more allied to my beloved Northern Gothic than anything else in Italy. The symbolical animals under the columns of these porches are worthy of special note; they are (I think, always) carved in red marble, and have great dignity of expression; they evidently have a symbolical meaning, and are either caressing or destroying some small figure. In guide-books they are said to represent the Church welcoming the repentant sinner or crushing heresy.

* A paper read at a meeting of the Architectural Association on the 6th inst.

Tombs.

Tombs, free standing or wall tombs, are, owing to the climate, much more frequently found in the open air in Italy than in this country. It was very usual to put wall tombs in the west fronts of the churches, as at St. Giacomo Maggiore at Bologna, and sometimes they are found on the other sides as well, often treated quite as decorative features. Of the free-standing tombs, I am not sure that I do not prefer the simplest, such as the remarkably beautiful one which is bracketed out over a gateway to the north of the west entrance to Sta. Anastasia at Verona, after seeing which I was a little disappointed with the celebrated "Tombs of the Scaligeri," in the same town. I suppose I expected too much of these renowned works of art, for there seems to be a consensus of opinion that they are among the most beautiful productions of the country. Beautiful as they certainly are, I fancy I detect in them that carelessness of design of which I have spoken. It seems, for instance, a very poor expedient for getting a pinnacle to erect on the angle of the tomb of Mastino a little colonnette to carry a platform, on which a little canopied niche is built up like a separate structure or an after-thought. If it were altogether removed, the tomb would be just as complete without it. Again, if it were desired to erect an equestrian statue of the great man, surely some other position might have been found for it which would not have necessitated truncating the cone which forms the canopy.

Campanili.

Coming to the never-failing subject of the campanili, which are such a prominent and attractive feature in all Italian towns from north to south, I can only afford space to mention a few of them, and to point out some of what I conceive to be their excellences and defects. The glorious campanili of Giotto, at Florence, should by right come first; but I dare neither describe nor criticise what is so well known, and has been a pet subject with all writers on Italian art. It is enough to ask those who only know it from drawings and photographs to suspend their judgment, if it be an adverse one, until they have seen it. I went to Florence feeling sure I could not like it, having judged by the framed panelling and the heavy cornice, and generally unsatisfactory outline at the summit. But the beauty and exquisite delicacy of the tracery and carving, and the tender tones of the marble which no drawing can reproduce, at once turned my prejudice into the sincerest admiration. There is a marble campanile attached to the cathedral at Siena, which, though beautiful in its way, always made me smile when I looked at it. The architect had evidently laid hold very firmly indeed of the principle that towers should grow lighter in design as they ascend, and he hit upon the very simple expedient of building first one storey quite blank, then a storey with a single opening in each face, then another with double openings, then triple, and so on until the topmost stage has a little arcade of six arches on each face. The principle, no doubt, is carried out to the letter, but the method is surely open to the charge of being ridiculously childish.

The characteristic towers of Northern Italy are the red brick ones which are found in every town, and indeed in many villages as well. They are of the simplest possible design, proudly, almost contemptuously plain, square in plan without buttresses or openings, and with only slight breaks in the shape of shallow projections or narrow strings until the summit is reached, when there is a double or triple opening in each face, and the whole is practically finished with a deep corbel-table and slight cornice. But on the top of this there is generally placed, without any preparation, a circular brick cone; it cannot be called a spire, and occasionally the angles are filled up with little brick pinnacles of similar design, also popped on as an after-thought. The cone and pinnacles are constructed of bricks showing circular ends on the face and giving an appearance of scales. The campanili of St. Zeno and St. Fermo Maggiore at Verona, of the cathedral at Piacenza, St. Barnaba, Venice, and St. Corona at Vicenza, may be taken as specimens of this class, only in the last-named some slight preparation is made for the cone by first erecting a short octagon on the top of the tower. The campanile of Parma Cathedral is similar, but the cone is of stone and octagonal. That of St. Samuele at Venice is practically the same, but displays a little more thought in design, tapering from the base to the summit, and being appropriately crowned with a high pyramidal lead roof. The tower of the palace of the Scaligers at Verona is also similar, but the cornice is carried on boldly projecting corbels, and is surmounted by a beautiful little octagon with a low hipped roof. The celebrated campanile of St. Mark's at Venice was also probably intended to be something of the same sort, but it was finished in Renaissance times, and is surmounted by a solid, sepulchral-looking monument, which seems as if it must necessarily break through the light arcaded storey beneath. The beautiful campanile of St. Antonio at Milan is crowned with a brick cone, but is octagonal in plan and much more elaborate in design. The best view of it is to be had from the roof of the cathedral. Of all towns I have ever seen, Bologna is the place for towers. Coming up to it by the rail, which happens to be on a high level, they seem to stand up almost like the masts below London Bridge. Among them are those ridiculous specimens of engineering science, the towers called Asinetti and

Garisendi, plain brick structures (the latter built on purpose to rival the leaning tower of Pisa), made to lean in opposite directions so as to increase their apparent inclination. Then there are the towers of the cathedral and Palazzo del Podesta, somewhat similar to the campanili described above, the two towers of St. Francesco, the larger of which has elaborate wall and window tracery in terracotta, and others that I do not now remember.

Ceilings.

A sketch of architectural features, peculiarly Italian, would not be complete, I think, without some mention of the wooden ceilings of two churches at Verona (I am told that there is a church at Venice, St. Stefano, with a similar ceiling), I mean those of St. Zeno and St. Fermo Maggiore. They are of wood, in a sort of foliated, barrel-vault form. That of St. Zeno is in three curves only, with wooden ties at intervals half-way up, which are probably the tie-beams of the roof-trusses. The ceiling of St. Fermo Maggiore has five curves with iron ties, also about half-way up, and king-rods. The curves are divided by nearly upright faces and horizontal soffits. In both cases the lowest curve starts from the outer end of a row of wooden corbels, leaving a wide soffit between it and the wall. The curved surfaces are divided up into small coffers by narrow wooden bands, on which is a roughly-painted pattern in black, the rest being also decorated in colour. I was much charmed with these ceilings, and especially with the more elaborate one, though it, at any rate, if not the other also, must be entirely unconstructional.

Baptisteries.

There are in Italy a large number of square, polygonal, and circular churches and baptisteries; indeed, the latter, as separate buildings, are peculiar to the country. Many, such as the circular baptistery at Pisa, and those at Parma and Pistoja, are too well known to need more than mention of their names; but there is one very interesting little church, Sta. Fosca, at Torcello, near Venice (from which, in fact, Venice was first colonised), which greatly took my fancy, and of which I will attempt a short description. The plan is cruciform inside, consisting of a large square area with short, aisled nave and transepts of one bay each, mere recesses, one might call them, divided into centre and side compartments and a chancel of two bays with three apses. The side of the square is the whole width of the nave, including the aisles, and is worked into a circle at the top, by means of a pendentive and two arches, one over the other, at each angle. It may possibly have been intended to erect a dome, but the roof is now a flat cone, constructed very simply in wood. Externally, advantage is taken of the shortness of the arms of the cross to turn the plan into an octagon, round which runs an open cloister or loggia. The arms of the cross show over the loggia, and the circular upper part is piled up so as to form a most picturesque ground.

Certosa of Pavia.

One of the most beautiful and most interesting buildings in North Italy is the monastery known as the Certosa of Pavia, situated between that town and Milan. Its gorgeous marble front is covered with a perfectly bewildering mass of exquisite detail—statues in the round (about one hundred of which are life-size), vignettes, busts, and Bible history scenes in high and low relief, in niches, panels, and medallions; foliated pilasters and carved baluster colonnettes, besides moulded and inlaid work, all executed by artists of high ability, and enough in quantity to supply half a dozen such façades with interest and artistic excellence. Unfortunately, it is not enough, or perhaps is too much, to make one such front really beautiful. It serves, indeed, better than anything to point the old saying that one may have too much of a good thing. I think the real charm of the building is anywhere rather than in this front. Its grouping, as seen from various points of view in the cloisters, is wonderfully beautiful, with the central feature of piled-up colonnades and all the light elegant little pinnacles round it, and the buttresses and apses, and that always pretty feature, the galleries under the cornices, so common in Italy and Germany. The colour, too, of the red bricks and terracotta combines well with that of the stonework and plaster and the clear blue sky. The terracotta cloisters also are full of interest for the London architect who desires to find the right way of using that much-abused new old material. In these cloisters, too, the detail is both abundant and beautiful, and, as I have before said, all figure work is constantly varied, and the interest thereby maintained.

Palazzo Comunale, Piacenza.

A remarkable building, and one in some respects characteristic of a class in Italy, is the Palazzo Comunale at Piacenza. It is rectangular in plan, with the long side facing the great Piazza. The lower storey is an open vaulted hall, of stone or marble (I am not quite certain which), with five pointed arches, on rectangular piers, on the long side, and two at each end. The upper storey, which contains the town hall, is of deep red brick, with marble quoins and cornice. On the principal face there are six great semicircular arches, very low in proportion, with wide archivolts of sumptuously moulded and carved bricks. They surround small three and four-light windows. The east end has two similar

arches, and a wheel-window in the gable; the other end, a square-headed window and no gable. Above the cornice rise high brick battlements, of the swallow-tailed form used by the Ghibelline party, and at the angles solid, heavy structures, which I hardly know whether to call turrets or pinnacles. Over the centre arch of the ground-storey is the balcony from which to address crowds collected on the piazza. There are carefully-coloured measured drawings of this building on a stand in the Architectural Court at South Kensington.

Venice.

I suppose there is no town in Europe (unless it be Constantinople) so strange and interesting to every ordinary traveller as Venice—a city without streets, in which the tramp of a horse is never heard, and no wheel-track is ever seen; in which the sea washes the very plinths and doorsteps of the houses, in which the cabs and omnibuses are boats, and the boats themselves, with all belonging to them, so different from the boats elsewhere, is something so wonderful and curious in itself to every dweller on dry land that it must of necessity awaken the interest of the most blasé of tourists. I shall always remember the delight of my first ride in a gondola through some of the quieter canals; the absence of rattle and tramp, and the smooth, easy, sleepy motion, the silence only broken by the regular click of the oar, and the occasional cry of “Sta’i,” or “Ia’e,” as we came round a corner; and the skill displayed in steering round the corner with the gunwale within an inch of the house wall for the whole 15 feet or 20 feet of its length, yet never touching it. And the architecture of Venice seems to me to be marvellously appropriate to the place; there is a lack of rigidity, even of apparent stability about it; an unrest and a light sparkling playfulness that is charmingly in keeping with the rippling waters of the lagoon. A level string, a really vertical wall, or a surface “in winding,” are hardly to be found in the whole town. It is, too, as strange and unique as the city itself, and all belonging to it. Where elsewhere are to be found anything at all resembling the light arcaded fronts of the palaces, or the curious west front of St. Mark’s, or the Rialto bridge—not to speak of all the other bridges—or even the Renaissance fronts of St. Zaccharia and the Ospedale Civile? The curiosity of these two buildings is in their gables—if one may call them gables—for they are semi-circular, just like the canopies of the doors I have described, magnified. In the façade of the Ospedale is a not very pleasant illustration of what I called the “playfulness” of Venetian architecture; it is a representation of architectural features in perspective in the marble incrustation. There is a copy of the doorway at South Kensington. Among the number of beautiful features in Venice, the wells in the court-yards are one of the most remarkable, and deserve some notice. They are frequently and, indeed, generally, found everywhere in Italy, but nowhere treated with so much artistic skill.

Perugia.

Another town which, though in a less degree, much interested and charmed me was Perugia. It is a picturesque old place, built over the slopes of the hills all up and down, with curious arches and buttresses and odd corners, doors where one would least expect them, and windows which in a duller climate would get no light, views suddenly turning up in unexpected places. Of the Apennines with picturesque villages on prominent points, consisting of a fortified convent or monastery with its walls and turrets and a few cottages round, or of the Umbrian valley stretching away to Lake Trasimeno itself, just hidden, unfortunately, by some low hills. The Piazza del Duomo, with the Palazzo Comunale, the cathedral, and the great fountain, the finest probably in the country, is a centre of architectural interest, which, however, is by no means confined to that spot. The old Etruscan gate, called the Arch of Augustus, the front of the Oratorio of St. Bernardino, already mentioned, the little church of the Madonna della Luce, with its bell turret, the colour decorations in the Collegio del Cambio, the old Chamber of Commerce, and the inlaid stalls and marble decorations of St. Pietro de’ Casinensi, are alone worth a journey from England to see, and they are only the more prominent of beautiful objects in the town.

In summing up this very desultory sketch of “Italy from an Architectural Point of View,” I may say that, whatever be the faults of the whole buildings, or of the features, they are never wanting in interest or suggestiveness; and, if they display some lack of care in design, that is more than compensated for by the artistic instincts of the architects, which saved them from making gross errors, and gave a peculiar charm to even the worst of their productions. The student will never in Italy want subjects for his pencil, and if he uses the brush so much the better, for colour is a principal element of beauty in most of the work. In no part of the world, moreover, can be found so many and such beautiful examples of sumptuous work, especially in church furniture and all kinds of decoration.

I have not had time—nor, indeed, am I competent—to speak of the mass of pictures and of sculpture by all the best masters to be found in the galleries of almost every town, and I have also omitted all mention of the beautiful and interesting objects to be found in the museums, which are the richest in Europe; but the architectural student should make it a principal object to become

well acquainted with both; for only so will he inhale that aroma of art with which the air in Italy is impregnated, as if it were one of its component gases.

In conclusion, I thank you sincerely for your kind attention, and hope that my sins, both of omission and commission, will be called attention to, and corrected by many of those present.

THE PROPOSED LIVERPOOL CATHEDRAL.

A MEETING of the Executive Committee of the proposed cathedral for the diocese of Liverpool was held on Monday last. The Bishop of Liverpool presided, and said that their first business was to appoint officers and sub-committees. With regard to secretaries there would be a great deal of business before the Executive Committee. Whatever site might be chosen or adopted, there would be, in all probability, an application for an Act of Parliament. To obtain a site and make it their own would entail a great deal of correspondence. In addition there would be correspondence with the architects and with the Ecclesiastical Commissioners. They wanted, at all events, as secretaries, experienced men of business, able to give time—a great deal of time—to the work that might possibly be before them. The work, indeed, might be such that it might be necessary to obtain paid assistance for all the clerical work that had to be done. He did not wish to dictate, but he thought they might go back to the Bishopric Committee and get two names of the fittest men to appoint as secretaries. Canon Hume was the clerical and Mr. C. Aspinall the lay secretary of the Bishopric Committee, and they did their work in a most satisfactory manner. They would require another clerical and another lay secretary, but he would take the sense of the meeting whether Canon Hume and Mr. C. Aspinall should be appointed.

The meeting approved of the suggestion of the Bishop. Canon Feilden and Mr. Arthur Earle were also appointed clerical and lay secretaries respectively, to act in conjunction with Canon Hume and Mr. C. Aspinall.

The Bishop next called upon the meeting to appoint two treasurers. He had the gratifying announcement to make that Sir T. Edwards-Moss had intimated that they might put his name down for 1,000*l*. While walking on the Landing-stage the other day he (the Bishop) met a gentleman he never saw before, and whose name he had never heard before, who conversed with him and said he was a Wesleyan Methodist, but he so entirely approved of the proposed cathedral that when the money was wanted he would give 100*l*. He (the Bishop) had faith in Liverpool doing anything it set its mind on doing, and he thought there were 250 churchmen in the diocese who could easily give 1,000*l*. each without missing it, and who would not be poorer in reality if they gave it. He suggested that Alderman W. B. Forwood should be appointed as one of the treasurers.

The meeting agreed to the suggestion, and Mr. J. Prescott was appointed as his colleague.

The Sites Sub-committee, the Architecture and Building Sub-committee, and the Finance Sub-committee, already in existence, were revised, and, some additions having been made, were permanently appointed.

The Bishop dwelt upon the importance of the Sites Sub-committee meeting as early as possible, and the secretary (the Rev. J. H. D. Cochrane) was instructed to arrange for an early meeting, and also to ask the permission of the mayor to use the town hall for the meetings of the committee.

On the motion of Alderman Samuelson, seconded by Sir James Picton, a vote of thanks was given to the Bishop for presiding, the meeting closed.

THE RUINS OF EPHEBUS.

A LETTER has appeared in the *Times* from Mr. J. T. Wood, who is now at Ephesus. He says:—

Since my return here to resume my excavations on the site of the Temple of Diana, I have been more than ever convinced of the necessity there is of taking away whatever valuable fragments of sculpture may be found on further exploration, and of not leaving them on the spot where they are found at the mercy of visitors, very few of whom would allow them to remain without injury. It has been more than once suggested by writers in the *Times* that whatever is discovered in excavations should be left as found, forgetting that no funds would be forthcoming for excavations to be made under such conditions. After inspection of the ruins of the temple from day to day for the last ten days, I can safely assert that visitors have wilfully destroyed almost every vestige of the fillets dividing the flutings of the hundred frusta or drums of the columns which remain on the site, a striking proof that nothing left upon the sites of ruins, excepting when they can be strictly guarded, is safe from the hands of the destroyer; and to guard the ruins of Ephesus, as one of your correspondents recently proposed, would, for obvious reasons, be quite impossible.

A few stones of the walling of the most ancient of the three temples of which I found remains were left *in situ* as I found

them, but visitors, with a rabid desire to possess even an unmeaning chipping of the famous temple, have hacked away at one of the most beautiful of these wall-stones, which showed, when found, the delicate tool-marks of the Greek mason of the sixth century B.C., until half its beauty had disappeared; and I suppose that, if visitors had known that this was one of the identical wall-stones of the temple to which Cressus so liberally contributed, not a morsel of it would now remain. After all I see around me on revisiting the ruins of Ephesus, I feel thankful that we have rescued from destruction, as well as from oblivion, the remains that are now safely housed in the British Museum.

The following is an extract from a letter from Smyrna: Mr. Wood is expected here to-morrow—nothing much is known of his plans, but it is thought he will start for Ephesus as soon as possible. It certainly does seem a pity to disturb the ancient tombs and monuments at Ephesus, but what is to be done? If you could only see the way in which some of the finest pieces of sculpture are chipped and destroyed by the tourists who come here every spring on their way from the Holy Land, you would see how very necessary it is that some steps should at once be taken to preserve these ancient ruins. In a few years it will be too late, for there will be nothing left. It is next to impossible to go to Ephesus just at present, as the country is so very unsafe on account of the brigands—it is much worse than it has been for many years. Even the streets of Smyrna are unsafe at night, and one is obliged always to carry a revolver. The police are worse than useless, for they generally manage to be out of the way when wanted. Not that it would do much good to arrest the robbers, for the state of Turkish justice is such that a man can nearly always get off if he be able to give a few pounds to the judge.

THE GLASGOW HOSPITAL COMPETITION.

THE first premium in the competition for the Southern Hospital, Glasgow, has been awarded to Messrs. Campbell Douglas, & Sellars, of Glasgow, whose plans bore the motto "Hygiene." The adjudicators placed the remaining five of the six selected plans in the following order: 2. "Isolation," Mr. James Fairley, A.R.I.B.A., India Buildings, Edinburgh. 3. "Forsitan," Messrs. Mills & Murgatroyd, Manchester. 4. "Coila," Mr. Francis Stirrat, Glasgow. 5. "Echelon," Messrs. K. D. Young & H. Hall, London. 6. "Rutherglen," Messrs. S. & A. Smith, Hastings. There were forty-six competitors.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

ON Saturday the members of this association went on the first sketching excursion of the season. Arriving at Knowle, the party at once proceeded to the church dedicated to St. Giles at Packwood, which is probably the quaintest in the county. This church does not betray the hands of the restorer. Many parts, such as the high pews, the select pews, and the old pulpit, recall to one's mind the past Reformation era. On the north side is a red-brick transept (bearing a tableted date 1704), which, although somewhat bastard in style when combined with the rest of the fabric, tends to give it rather an artistic finish, and to cast off the mantle of stiffness so often noticeable when churches present the strictest purity of style. The tower is of excellent proportion, and with the porch, the curious gables, and the lichen-covered roofs, presents a view well worthy of the artist's pencil. With the sun shining out gloriously, the party next walked to the church of St. Mary at Lapworth, which is in every particular a more pretentious structure than that at Packwood. The nave arcades of this church exhibit specimens of the Norman and Early English styles, while other parts are Decorated; and the clerestory, which is rather out of proportion and overwhelming, and the tower are in the Perpendicular style. Many parts of this edifice bear evidence that the restorer has been at work, and also that modern design is not altogether absent. A cross-country stroll brought the association to Henley-in-Arden, whence, after remarking the various specimens of half-timber, the few doorways in the style of Chippendale, and the Perpendicular church of St. John, they repaired to the church dedicated to St. Nicholas at Beaudesert. Here the south doorway and the east window are Norman, richly moulded and decorated with the zigzag ornament. The tower is in the Perpendicular style. Internally, the church is particularly interesting to archæologists, the chancel being one of the oldest and best specimens of Norman work to be found. The semi-circular groining is particularly primitive, the horizontal ashlar over the groins occasioned by all the arches being kept to the same height at the crown, while being of different spans, together with the perfectly horizontal courses of the vaulting, evidence, apart from the Norman severity, its very early date. Proofs of the existence in olden times of mural decorations in the chancel are plainly evident from the patches of colour seen here and there since the walls have been stripped of their unsightly plaster. The party next proceeded two miles to Wooten Wawen to see the church of St. Peter, and they fortunately met the vicar, who very kindly conducted them round the church and explained the various

parts and objects of interest. Here was formerly a Benedictine priory, to which was attached the church, which is peculiarly planned, having nave, south aisle, chancel, and chantry chapel. The chapel is large, and is a private part of the edifice belonging to two families, the remains of whose ancestors here repose. The nave is spacious, as is also the chancel, but the Saxon walls under the tower are pierced with such small openings that but a very meagre portion of the fine west Perpendicular window can be seen from the nave. The tower is central, dividing the nave from the chancel. The walls internally exhibit a very flat and unecclesiastical appearance, the old Gothic masonry being disfigured by unsightly plaster. The pulpit is a fine specimen of Perpendicular woodwork, though the proportion is somewhat stilted. The old high-backed pews have wisely been removed, as has also a gallery which extended along the west end of the nave. The church is large, lofty, and peculiar, and were the plaster removed from its walls the interior effect would be considerably enhanced. After a walk of four miles the members reached Claverdon, whence they returned by train to Birmingham.

LEGAL.

Barnstaple County Court.—April 13.

(Before Mr. Serjeant PETERSDORFF.)

GOLD AND WEBB v. LAKE.

ARCHITECT'S FEES.

The plaintiffs in this case, who were architects, of Barnstaple, sought to recover from the defendant, of Newport, Barnstaple, the sum of 28*l.* 17*s.*, balance due for professional services rendered. In February 1880 the defendant determined to lay out a field for building, and consulted the plaintiffs. Plans were made by them, and the houses which were being built were being taken freely. The road suggested by plaintiffs, and the class of houses suggested, had been adopted by the defendant, and the speculation had turned out a good one. Their charges were to be one guinea per house, but defendant had paid only 10*l.*, besides two guineas into Court.

Mr. E. Webb, A.R.I.B.A., one of the plaintiffs, produced the plans of the property, according to the instructions he received from the defendant. One house at the corner of Newport Road the defendant had built for himself. The defendant had seen the drawings and plans on several occasions, and the plans were the outcome of conversations between him and the defendant. As many as twenty-one houses had been built, and the scheme generally as agreed upon had been carried out. The plan for the defendant's own house was passed by the local authority, and signed by the mayor. Defendant had told him that his house had cost him about 600*l.*, and that if it had been built by contract in the usual way it would have cost him 100*l.* more than that. Assuming it cost 600*l.*, the ordinary charge for the architect would be 5 per cent. on the outlay, but the defendant did not require a full specification, nor the full amount of supervision, as his brother-in-law, Mr. Bushell, would do that part of the work. In consequence of the assistance of Bushell, plaintiffs reduced their charge to 3*½* per cent. With regard to the other houses, he did not charge a commission on the expenditure. He charged one guinea a house for supplying plans and giving details. There was no written agreement, but the verbal agreement was that each person building was to employ him and pay him. The defendant had built houses there himself.

In cross-examination by Mr. Sparkes, the plaintiff stated that he would not say the defendant told him he should not want him at all to superintend the work. He established his claim to superintendence by being on the premises with the defendant. He had sent in a bill to Mr. Bushell for three of the houses, but as he had refused to pay it he had put that into his bill against the defendant.

At this stage it was suggested that the jury should be dispensed with, His Honour doubting whether they had succeeded in following up the different matters alluded to. He thought a reference was the best way to decide the case.

After some consultation between the parties it was decided that the case should go before Mr. J. T. Pitts-Tucker as arbitrator.

High Court of Justice.

(Before Mr. Baron POLLOCK.)

SIMS AND OTHERS, EXECUTORS, v. SCHWABE.

This was a case of some interest to all those who buy and sell old pictures or works of art. The action was brought by the executors of the late Mr. Antonio Perocchy, a dealer in works of art, against Mr. Alfred J. Schwabe, to recover 250*l.*, the price of two pictures, alleged to have been sold to the defendant by the testator. These were two small works (some 18 inches by 12 inches), called *The Madonna and Child*, attributed to Raphael, and *The Marriage of St. Catherine*, also put down to Corregio. It appeared that the deceased, Mr. Perocchy, had had frequent dealings with the defendant for all sorts of works of art, pictures, bronzes, furniture, china &c. and sold the two pictures in question.

to him on May 6, 1880. The pictures were delivered at the defendant's rooms in Bond Street on May 7 and 9, and there they remained till April 1882. At the same time that the pictures were delivered, Mr. Perocchy sent a piece of old Italian silk damask, which Mrs. Perocchy said cost 11s. a yard, to the defendant, on the condition that if he did not buy the pictures he was to pay for it, but if he did it was to be a present. This stuff the defendant said he had never used in any way or even unpacked, but he kept it "because he thought it might be useful." According to Mrs. Perocchy and her foreman, Mr. Hart, the bargain was that if Mr. Schwabe did not find satisfactory proof that the pictures were by the reputed authors, he might return them within a reasonable time, otherwise the price was to be 250*l*. In August 1880, Mr. Perocchy sent in an account to the defendant for 864*l*. 15*s*. for pictures, &c., which was mostly settled, but left a balance of 214*l*. Mr. Perocchy went to Italy for the benefit of his health in September 1880, and died there on December 8, 1880. In February 1881 Mrs. Perocchy had an interview with the defendant, when he said that he had not made up his mind about the pictures; the more he saw of them the more he liked them. About a year afterwards an invoice was sent in to the defendant, where, by a mistake of the foreman, the price charged was 215*l*., instead of 250*l*. On March 30, 1882, the executors wrote to the defendant as follows: "The time having arrived when it is necessary for the executors to complete the settlement of this estate, they will be greatly obliged by your kindly remitting the amount of your account at your earliest convenience. By a clerical error you had an incorrect invoice sent to you before." To this the defendant replied: "In reply to your application for 251*l*. 10*s*. 6*d*., I will send you the sum of 1*l*. 10*s*. 6*d*., with the two pictures which I had on approval, but which I beg to return, as I never said I would retain them; and it is only to-day that I have had the opinion I was waiting for from an expert as to their genuineness, and which is quite unfavourable." To this Madame Perocchy answered that she was surprised; after what had happened and been said she quite thought defendant meant to keep the pictures. The defendant then wrote that he was surprised the pictures had never been sent for, as he on no occasion expressed an intention to buy them, had kept them quite at her disposal, and intended, should a competent person have agreed with the origin that was attributed, to have made an offer for them. After some further application, the defendant, on July 14, 1882, instructed his solicitors to defend any process, and the writ was issued on July 17.

The defendant said things had often been sent to him in this way on approval by Mr. Perocchy. It was extremely difficult to get an opinion about the old masters. People were so prejudiced, and he was not in the way of it. He had asked no one whose opinion had any weight, though he knew Mr. Colnaghi was an expert, and in London. He had never said he was pleased with the pictures, or bought them out and out. It was a strange coincidence his having got an unfavourable verdict the day he sent the picture back. Mr. A. Thibeaudeau was then called, and said he was a dealer in prints and old drawings, and sometimes in pictures. The defendant spoke to him a long time back about the pictures. When Dr. Bode, keeper of the Berlin Museum, and a great authority, arrived in England, as he generally came over for the Old Masters' Exhibition, he was to let the defendant know. The pictures were not originals, though he would rather not say positively, but have Dr. Bode's opinion on the matter.

Baron Pollock: Perhaps, like some other persons, he would rather be consulted in the proper way.

Mr. Martin Colnaghi said the original of the *Marriage of St. Catherine* was in the Louvre Gallery; this was a direct copy of the time, not a modern one—about 1580—perhaps by Palma. The *Madonna* was an interesting "school" picture of the time of Raphael, but not by him. Dr. Bode was, he thought, a great authority, but very few people in the world were capable of passing a good opinion on the old Italian masters. Cross-examined: He himself was considered a good authority on these matters. If the *Madonna* were an authenticated Raphael he would willingly give 2,000*l*. for it.

Baron Pollock, in summing up, observed that no question arose as to the market value of the pictures; the price seemed to be pretty well agreed on, but the payment was said by the defendant to be on a certain condition—viz., that they turned out to be originals. As there was no memorandum in writing of the transaction, the case would depend on the oral testimony of the witnesses. It was not alleged by the plaintiffs that the sale by Perocchy was a sale out and out, which would make the matter much more simple. Could the jury infer from the conduct of the parties, and from all that had happened in the case that what was at first an incomplete and inchoate bargain became afterwards an absolute and complete sale? And that was, no doubt, a very delicate question. Mr. Hart said that Perocchy told the defendant that he had no doubt of the pictures being originals himself, but as they had been very much doubted in London, he had better get another opinion about them. Was there such a contract on May 6, 1880, which by subsequent conduct became and was turned into a perfect contract? Or did they think that, though a long time had elapsed, there never was a binding contract to fix the de-

fendant? This was for the plaintiffs to make out, and if they did so, they were entitled to a verdict for 250*l*.; if not, then the verdict would be for the defendant, and the pictures would remain the property of the executors.

The jury found a verdict for the plaintiffs for 250*l*.

NEW BUILDINGS.

Bacup, Lancashire.—Extensive additions and alterations have just been completed in connection with the Baptist schools, South Street. Four new class-rooms, new heating-room, and two new shops, and a new boundary wall enclosing new sanitary out-buildings, has also been added. The style adopted is Gothic, the whole being in harmony with the main structure recently erected. The contractors (who are all Bacup tradesmen) were Messrs. Hargreaves & Co., excavating, masonry, and bricklayers' work; Wilkinson, joiner's work; Rushton, slater's work; Hirst, plumber's and glazier's work; and Jackson, plasterer's and painter's work. The work was entrusted by the trustees and pastor to the care of Mr. Samuel T. Williams, architect, Irwell Terrace, Bacup, who prepared the drawings, and under whose supervision the entire works have been successfully carried out.

GENERAL.

Mr. C. Roach Smith, F.S.A., has offered to present the town of Sittingbourne with his collection of Pre-historic, British, Roman, Saxon, and Mediaeval antiquities, found in Kent during the last eighteen years.

Tenders have been received for the Middlesbrough Town Hall and Municipal Buildings, ranging upwards, the former from 26,487*l*., and the latter from 42,000*l*.

The Statue of Earl Beaconsfield, which was unveiled on Thursday in Parliament Square, Westminster, was modelled by Signor Raggi, and was cast in bronze by Messrs. St. Young & Co., of Pimlico.

Vigorous Efforts are in progress for the establishment of a modern watering-place beside the quaint old village of Bexhill. Mr. J. W. Webb, of Brockley, S.E., has contracted for the construction of the sea-wall and esplanade at a cost of 34,000*l*., 17,000*l*. of which is to be taken in land.

The old Parish Church at Govan, on the banks of the Clyde, is to be removed to make room for a handsome new church designed by Mr. R. Rowand Anderson, of Edinburgh. The old building (erected about one hundred years ago) is to be carefully taken down, and re-erected on a new site.

The Institution of Civil Engineers, which was founded in 1818 for promoting mechanical philosophy, and was incorporated in 1828 for the general advancement of mechanical science, has now on its lists 21 honorary members, 1,347 members, 1,671 associate members, 524 associates, and 774 students, or, in all, 4,337. The gross number at the same date last year was 4,117.

New Buildings, Leadenhall Street.—An illustration of the new buildings in Leadenhall Street was published in *The Architect* on March 24. We have been asked to state that Mr. Shepherd and Mr. Boyce are the owners of the several blocks which they have erected. The carving of Mr. Shepherd's building was executed by Mr. Seale. Mr. Brunton was foreman. Mr. W. Thompson, of Old Broad Street, was associated with Messrs. Edmeston in carrying out this part of the building.

Messrs. Pictor & Sons, of Box—the well-known firm of Bath-stone merchants—have been actively engaged during the past fifteen months in opening out the Corsham Down stone, in the Monks Park Estate of Sir Gabriel Goldney, Bart., M.P. From the various testing-shafts which have been sunk, they have been able to fix upon an *excellent vein of mineral*, the quality of which has greatly exceeded their most sanguine expectations. The working shaft, and all the machinery requisite for raising the stone in any quantity has been completed for some time past, and they are now prepared to send out stone, the quality of which is very similar in texture to the best beds of the original Corsham stone, which they have been supplying so extensively for many years. It is of a warm, pleasing tint, and masons would find its mildness, and the large shapely size of the blocks, a great inducement to use it extensively.

The Chancel of St. Nicholas Church, Tower Street, Birmingham, has been enriched by the completion of the large east window, containing the subject of the Crucifixion in three lights, the Agony in the Garden and Betrayal in the side lights. The subjects are large, and placed upon light bases, containing the Agnus Dei and the Four Apocalyptic Creatures, and under canopies. In the tracery Our Lord in Majesty sits adored by angels. The ornamentation in general is light, with the subjects on rich panels. The window is designed by Mr. T. W. Camm, and executed by Messrs. R. W. Winfield & Co., successors to Camm Brothers, Birmingham and Smethwick. The same firm also have executed for the above church an aisle window to the memory of the late Samuel Mayon, subject "The Raising of Lazarus."

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, APRIL 21, 1883.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

HAWLEY (accepted). . . 560 0 0

LONDON.

For First Contract for the Re-erection of Alhambra Theatre. Messrs. PARRY & REED, Architects.

McLachlan . . . 48 weeks £12,170 0 0
Ashby & Horner . . . 47 " 40,636 0 0
Perry & Co. . . 41 " 38,854 0 0
Langmead & Way . . . 52 " 38,720 0 0
Clemence . . . 52 " 38,510 0 0
Patman & Fotheringham . . . 48 " 37,709 0 0
Brass . . . 26 " 32,883 0 0
Clarke & Bracey . . . 33 " 32,451 0 0
Merritt & Ashby . . . 36 " 32,233 0 0

As time is of the utmost importance to the Company, the contractors were informed that a fine of £50 a day would be levied for failure to complete within the agreed time. The relative position of the tenders, adding £50 per day in excess of the shortest time named will, therefore, be thus:—

McLachlan . . . £48,770 0 0
Ashby & Horner . . . 46,936 0 0
Langmead & Way . . . 46,520 0 0
Clemence . . . 46,310 0 0
Patman & Fotheringham . . . 44,309 0 0
Perry & Co. . . 43,354 0 0
Merritt & Ashby . . . 35,233 0 0
Clarke & Bracey . . . 34,551 0 0
Brass . . . 32,883 0 0

Tenders were also received from Messrs. Trollope, Messrs. Rider, and Mr. Chappell; but as the form of tender sent out had been varied by them the amounts are not included in the above lists. As the Board of Works has not yet passed the plans for the new building no contract has been entered into.

For Pulling-down and Rebuilding the Swan Public-house and adjoining Premises, being Nos. 42 and 44 High Street, Islington, N. Mr. FRANK MATCHAM, Architect, Rugby Chambers, Bedford Row, W.C. Quantities by Mr. Frederick Thomson.

PARIAN CEMENT. NINE ELMS BRAND.

MADE BY THE PECULIAR PATENT PROCESS.

Strongly Recommended, after 30 years' experience, for DAMP WALLS, on a backing of Portland, and as the ONLY SAFE CEMENT, capable of being PAINTED and PAPERED within 24 HOURS.

LARGELY PREFERRED FOR HOSPITAL WALLS & CEILINGS, BEING NON-ABSORBENT & NON-EFFLORESCENT.

TESTIMONIAL.

37 NORFOLK STREET, STRAND, W.C.: April 9, 1880.

DEAR SIR,—The Parian Cement which has been used extensively in St. Thomas's Hospital, and of which a large quantity was supplied by you, has given great satisfaction, and is, I believe, generally acknowledged to be the best material for lining the walls of hospital buildings. Its hard, smooth surface admits of being readily cleaned, which I need hardly say is of great importance.

I am, Dear Sirs, yours faithfully,

Messrs. FRANCIS & Co.

HENRY CURREY, ARCHITECT.

The Architect.

NINETEENTH-CENTURY ARCHITECTURE A LONG WAY OFF.

It is a sad heart that never rejoices, and we may even question whether such a heart is in the right place. The custom of rejoicing once a year particularly and formally is a well-known English institution; and, amongst other public bodies that maintain this excellent practice with spirit, we have to number the Architectural Association of London, which holds every Easter-time a certain special and private *r union*, called "the Members' Soir e," whereat professional high jinks (if we may be excused for using so vulgar an expression) constitute, as a rule, the most delightful part of a most delightful entertainment. This year the assembly in question has just been held, and a professorial "lecture" which was there delivered (in character) upon "The Architecture of the Nineteenth Century," although meant for no more than a passing drollery, was so happily conceived and executed, that we are sure our readers will not be displeased to learn something more about it than a mere notice of the meeting can supply, if only for the encouragement of harmless pleasantry.

The discourse was dated somewhere about the twenty-fifth century or so of the Christian era, as nearly as we could judge by its general tenor as an act of criticism, and the advanced character of the sentiments and allusions of the learned professor. At any rate, the architecture of the nineteenth century—it was more particularly the early part of the last quarter of it that was dealt with—did not seem to be held in high esteem. True, when the audience (there were several hundreds of joyous young architects present) seemed inclined to receive some of the observations with levity, not to say laughter, the prompt pedagogic severity with which such behaviour was checked was all that the best of us could reasonably expect as a compliment on high authority to our day and generation; but on the whole, there was perhaps scarcely enough to be discerned throughout the "lecture" of that recognition of the intellectual importance of our age, the great success of our undertakings, and the immortal endurance of our fame, upon which, as some of us appear to be disposed to think, the verdict of posterity is to turn. The period under review was nevertheless regarded with a lively interest; the gravity of the occasion and the high tone of the discourse seemed alike to prevent the introduction of unseemly sarcasm or inconvenient wit; the style, indeed, was as dry as arch ology ought to be; and if the general impression left upon the mind of visitors like ourselves was possibly foggy, and not unintentionally so, it was certainly neither painful nor unsatisfactory.

After some shrewd remarks of a preliminary nature, the learned professor turned seriously to the question of certain unexplained and probably unexplainable contrivances, which appeared to be much used by the people of the remote period in question, under the name of "chimneys." Although the metropolis of England, which now extended to so great a number of miles—hundreds of miles—in all directions, was then a town of only four millions of inhabitants, through whose midst rolled the dirty river long since accommodated scientifically in pipes, and the broad area which it occupied converted into valuable building land, yet, what with the steam arising from this river, and the pestilent vapours which were made somehow to escape from thousands of "chimneys," the people of the town were from time to time brought to the verge of absolute suffocation, besides having to grope their way in utter darkness at noon. The professor's opinion inclined to the idea that these chimneys must have been leading features, not only in the building, but in the architecture of the period; and in proof of this he referred to certain delineations of the time, exhibiting an unexpected variety of designs for such instruments as leading objects of art, and also quoted extant descriptions of certain remarkable baskets in which an extinct substance was consumed by fire, with a view to the generation of the fumes before alluded to, whereby in some

way the warming of houses was believed to have been effected. The artistic sky line produced by the features under review was lightly touched upon, and especially the elegant effect of a particular kind called "tallboys." Turning to a standing grievance of nineteenth-century writers—formulated in the customary exclamation, "We have no style!"—the professor felt himself able to reply in the conclusive words, "You had chimneys, and you *had* style!"

The very singular subterranean ways for the conveyance of sewage and passengers, remains of which had recently been discovered, next received passing notice; and then followed an allusion to "the mouldering tower where formerly stood the ancient Palace of Justice." This was evidently the production of a master mind, and it probably belonged to the twelfth century; "some exceedingly beautiful fragments" of it might still be seen. But another much more extraordinary relic belonging to the same locality, and still entire, was the figure of an animal something like a dragon, the purpose of which was unfortunately altogether lost in oblivion, unless it had been the sign of an inn called the "Jugged Hare," which was thought to have once stood there, occupying the site of an old pagan "Temple." The obelisk not far off was also adverted to, and its very satisfactory state of preservation, except as regarded certain bronzes with which it had been at one time attempted to be decorated, and which had wholly disappeared from history.

A ruined church at Bedford Park was next pointed to, as a thing full of interest. In the quarter around this example of art there had dwelt a distinct and peculiar race of people. They called themselves * sthetes*. Their architecture was known by the names of "Normanshaw" and "Queen Anne"; terms not easily accounted for, unless they were used in derision. The word "Norman" was so far intelligible that it seemed generally to have reference to one "Conquering BILLY" (so called in profane literature), who flourished with a vengeance about the year 1066; but the signification of the affix "shaw" was entirely lost; and what was the connection with "Queen ANNE," except that a personage of that name was a descendant of BILLY many centuries after, no one could now discover. A heap of dust (besides, of course, the ruined church) was all that remained to mark the place of abode of this singular race. Their physiognomy, as shown in extant drawings, although not conveying to the observer the impression of power, indicated that on the whole they had probably been well-meaning and perfectly harmless people. "Their faith, with other faiths, had had its day and ceased to be." As regarded their architectural style, recent researches in the buried cities of the country once called Holland had thrown a sort of light upon certain features of it; and these the professor explained with the help of his illustrations, amidst many evidences of interest and appreciation.

Returning to the subways found near the obelisk, the curious structures were adverted to which had been lately discovered above ground in connection with these. Certain learned architects, by searching the ancient records, had been led to the conclusion that these were "blow-holes," constructed to ventilate the ancient House of Parliament, an edifice which stood not far off, and was justly admired in its time, but of which only one tower and a fragment of another now remained, together with some interesting statues close at hand, one of which was described in detail. The "blow-holes," however, had certainly been at one time a subject of controversy; and it was alleged by some authorities that a "company," which was then dragging people along underground by means of machines generating smoke, had procured for their private ends the making of a law for the construction of these "blow-holes" whilst the incautious and negligent legislators of the land were asleep, or whatever else, to the great detriment of certain public gardens formed at enormous cost by the people, the air of which thus became poisoned, and their utility therefore much impaired; a case, concluded the learned professor, solemnly, "not without interest and warning."

The architects of the nineteenth century were then considered personally. In respect of costume (unlike the professor himself), they were undistinguishable from ordinary citizens, all of whom wore, by-the-by, amongst other things, a peculiar garment upon their heads, derived from the chimneys before described. But, socially considered, they were joined together in unions or guilds. This could be seen by observing certain inscriptions, where the odd designations "Friba" and "Ariba," "Fsa" and "Ra," were attached to their names,

There was no evidence, however, to show that Fribas and Aribas made better work than "the men who belonged not to their guild." Indeed, the supreme influence of this guild could scarcely be traced. But it was pleasant to read the records of "another Society which existed at that time, and through whose ranks all the young men of the profession—many of them exceedingly gifted—passed." The influence exerted by this other guild was great. The inquiries which came before it were carried through with vigour; whereas in the older body such questions would generally take a decade to consider, and, as matter of fact, no record existed of any decision of importance having been rashly arrived at. In course of time the younger guild, full of life, vigour, and talent, had absorbed the older body. It was still called "the Architectural Association." And it was to this distinguished Society that the learned lecturer had ventured (in the twenty-fifth century or so, as has been mentioned) to offer these remarks, which he now brought to a close, we need scarcely say, amidst loud and long applause.

The author of this genial parody, of which this is necessarily a very much condensed and imperfect abstract, is a well known and popular member of the Association, and no less of the Institute itself. We are able to congratulate him especially upon the absence of that spice of acidity which few of our professional humourists could have so well avoided. Wit, and sometimes a little too strong a quality of it, is abundant amongst architects; it is not easy to say why. That Mr. COLE ADAMS, if he had not been so reticent, might have found abundant food for amusement, and, indeed, instruction, in many subjects which he wisely abstained from handling, is clear to anyone who thinks, for instance, of our competitions, our "fiduciary agency," our hysterical amateurism, our "cannibalism," our presidential elections, and other matters. But the task he set himself was, at least, much more appropriate to the occasion. A most interesting occasion it is when virtually the whole of our architectural juniors, from the beginner in practice to the beginner in pupillage, meet together to cultivate thorough fellowship and universal goodwill in so free and easy a way. A profession in which this can be done so well as it was done last week, not only without the jealousy of rivalry, but without either individual presumption or individual apprehension, is one that cannot but prove both useful to the public interest and creditable to its own private purpose. Whether our junior guild is ever to "absorb" the senior—as the lean kine certainly have absorbed the fat kine so often in history—we need not care to inquire; but for the present it is enough to congratulate the Association upon the kindly feeling with which it has so long been regarded by the Institute, and which we hope with the utmost confidence may be continued with the same cordiality for many years to come—so long as they both shall live.

THE WORKS OF GEORGE TINWORTH.

THE exhibition of sculpture in terra-cotta and stoneware by Mr. GEORGE TINWORTH, now open at the Conduit Street Art Galleries, is in many ways remarkable. We have here the work of a true artist, who has won his right to the appellation by absolutely legitimate means, apart, that is, from favouring circumstance of any kind, and solely by force of natural faculty and persistent effort. Mr. TINWORTH was the son of a poor wheelwright, and after his father's death had to hold by the business for maintenance, until, through the help of Mr. SPARKES, then master of the Lambeth Art School, he passed from mending broken carts to fashioning pottery more or less decorative for Messrs. DOULTON. But from a little lad he had a direct impulse towards plastic art, and, despite of every discouragement from his father, contrived to obtain training in Lambeth Art School and the classes of the Royal Academy in the time spared from sordid manual labour. The start made when he passed into Messrs. DOULTON's factory, at the moment when the firm gave a decided artistic turn to their productions, was an opening of which young TINWORTH availed himself, as a man who escapes from prison into the free air; and although he has never sought to separate himself from the artisan class and to claim in contradistinction the position of artist-sculptor, he has been able under the generous encouragement of his employers to give play to the energies which impel him to express his thoughts in a plastic form that is almost unique. Some years ago, Mr. RUSKIN was struck

by the power shown in Mr. TINWORTH's studies in terra-cotta high relief of Scripture subjects exhibited at the Royal Academy, and subsequently he and Mr. STREET visited and encouraged the young artist, an interest practically followed up by Mr. STREET in obtaining for him the commissions to execute a reredos for York Minster, and medallion reliefs for the Guards' Chapel in Birdcage Walk.

The works shown in this exhibition consist first of the plaster reliefs by which Mr. TINWORTH won his studentships and distinctions in the academic classes, then of plaques and objects carried out in the coloured DOULTON ware, and finally and chiefly of terra-cotta panels in high relief, varying in scale from miniature plaques to compositions in which the figures are half-life scale. It is interesting to note that the academic essays are in no way, except by distinct merit in contour and modelling, unlike ordinary student work, but directly the artist does original work it is marked by a style of his own, a treatment of relief in excessive projection which disregards all the accepted art rules, a realism that is naive in its simplicity and directness, a religious sentiment that is deeply earnest, although without recognition of the mystic element, and even in symbolism is literal. In the introduction to the catalogue, the word "homely" is used to characterise the artist's style, and the epithet is apt enough; it applied to the art of the Nürnberg sculptors and gravers, and to much of the religious art of the Flemish school, and the quality which it indicates is in this modern work associated, as it was in the elder schools, with keen dramatic insight and vigorous realistic power. To pass in detail through the exhibition is not our purpose, but a few examples will indicate what we mean. The incidents in the small Scripture panels, the *Taking of Samson*, the *Tribute Money*, the *Call of Zacchæus*, *The Resurrection*, are almost humorous in anecdotic setting forth of the narrative; indeed, the figure of ZACCHÆUS letting himself down from the tree, and hanging by his arms, is quite comic in its literalism. But even those who judge the work by academic and classical standards must acknowledge the dramatic intensity of some of the figures in *The Massacre of the Innocents*, of *The Last Supper*, where the disciples rise tumultuously, each demanding "Is it I?" and of the very striking *Remorse of Judas*, where the traitor casts himself on the ground in agony as he flings the price of blood at the foot of the astonished high priest. In the illustration of *The Times of Solomon*, the artist has shown an ingenuity in the choice of his examples from Holy Writ which approaches imagination, and is, at all events, the production of a mind moving with eager intelligence among the types and symbols of the Scriptures, which have been its familiar and best prized study.

The large panels call for more consideration. It must be noted that Mr. TINWORTH has been gradually enlarging the scale on which he works, and his last production, *The Release of Barabbas*, is of a size that must have been difficult to bake. There are other changes to be noted in his recent work. The demonstrativeness of action in the figures seems to grow less emphatic, and gives place to a more accurate following of the living model. There is the same dramatic intuition, although less full of fire, that is seen in the earlier attempts; the compositions are not so crowded with figures over the space; the modelling of form and cast of drapery shows study; but the figures are not ordered with much more sense of appropriate relation, while they are even more boldly detached from the ground. Mr. TINWORTH's work is vigorous, earnest, and individual, of a kind that cannot be either judged or fettered by conventional academic rules; moreover, it may be said of the artist that any shortcomings there may be in his work proceed from lack of training. But it is not quite sound to talk in that way. A student who goes through the Academy and works in London has the finest models of his art before him; the collections at the British Museum and the South Kensington, the art libraries, the casts in the Academy, the exhibitions, are within his reach; it is absurd to lay so much stress on the question of want of training in the case of a man with strong art intuitions and faculties, who is surrounded by such teaching as this. The danger lies in wrong assimilation, in the application of the teaching to personal ends; and it is of course only too easy for a young self-helped artist to miss the great principles on which the Masters worked, and to be misled by the special manifestations of separate schools. We fancy that Mr. TINWORTH is just now in a transitional phase, and it is to be sincerely hoped that, in his desire for individuality, he may not

become indifferent to principles of art which have become established canons. An artist with such genuine talent and earnest purpose as Mr. TINWORTH is in danger if he seeks popular applause. He will, we feel sure, gain by the sympathetic criticisms which this gathering of his works will draw from competent judges that knowledge of his own strength, its dangers, and its limits, which will help him to acquire the reticence and nobility his art yet lacks, but which he is capable of attaining. It has been said that one of the characteristics of art in the nineteenth century is its independence. If so, this sculptor is a true man of his time. It is indeed a rare spectacle to see a manifestation of artistic energy so distinctly and vigorously individual.

THE FRENCH EXHIBITION OF DECORATIVE ARTS.

THE Salon of the Arts Décoratifs was opened in Paris on the 15th inst. by a dense crowd of *savants*, *litterati*, and artists. The public appreciate the rare beauty of the collections of retrospective art and the specimens of contemporary decoration, yet the effort to create in France an institution on the lines of the Kensington Museum does not excite the enthusiasm one would have anticipated. The *ouvrier* genius, whose wood sculpture accumulates in his back shop unsold, because he refuses to enrich the proprietors of gorgeous shops with the product of his brain and hand, who would give him the bare value of his time as a journeyman carver, gladly seizes the opportunity the Société des Arts Décoratifs generously gives him of exhibiting his cabinets, his mirrors, or his consoles. But unhappily the public, to whose fiat he hopes to submit his productions, crowd the Horse Show, and in a few days will throng the Salon, while the adjoining galleries, arranged by the delicate and refined taste of the director, M. GASNAULT, containing drawings by the greatest decorators the world has known, specimens of architectural carving (acknowledged examples of all periods), armoires by BÉRAIN, consoles by MEISSONIER, commodes by RIESENER, candelabras by GAUTHIÈRE, to say nothing of specimens of every known woven fabric of the sixteenth, seventeenth, and eighteenth centuries, and tapestries of the LOUIS XIII. period, fail to attract more than passing curiosity. Must the Parisian of the epoch be excited by the display of ideal or material sensualism to induce him to devote a few hours to the study of a noble institution as yet in its infancy, but destined (at least we hope so) to effect a beneficent and widespread influence on the art-working class of France? We think better of the modern Parisian, and attribute the *tiédeur* of his enthusiasm partly to the unlucky circumstance that Porte VI., the entrance to that part of the palace where the exhibition is held, is nearer the river than the Champs Elysées, therefore some hundreds of feet behind the main artery of Paris. The committee has not spared its own resources as regards the sums it has this spring expended on the purchase of specimens intended for the permanent exhibition—an *Armoire Louis XV.*, cost 2,205 francs; a *Coupoles Louis XIV.*, 1,780 francs.; another of the same epoch, 1,705 francs, &c. The Ministères have not hesitated to lend magnificent specimens of the furniture of the days of the Grand Monarque. "La Guerre" contributes a splendid table on which Louvois wrote many a declaration of war, and another from the Cabinet of COLBERT, on which VAUBAN probably spread his plans for the fortifying of the frontiers. On another, from the "Finance," DE CHOISEUL in his suit of red velvet with its ermine linings, may have signed many an order which permitted LA POMPADOUR to employ BOUCHER to paint the *Forges de Vulcain* for her Château de Bellevue, and FRAGONARD *Les Visitations de Vénus* for her apartments at Versailles.

The Salon, which has been just opened, has nothing to do with these permanent collections. It is simply an exhibition which it is the intention of the committee should be held annually in order to represent modern decorative works in painting and sculpture, stone or wood, enamels, &c. Entering by Porte VI. the visitor ascends a wide stone staircase, spite the scowl of defiance with which a colossal *Vercingetorix* receives nineteenth-century mortals at the base thereof, and passes the reproduction of the Buddhist Tope of Sanchi (Bhopal), executed under the orders of Captain COLE, R.E., and purchased by the Committee des Arts

Décoratifs from the Kensington Museum. At the head of the staircase is a fine specimen of hammered steel, in the form of a *lampe* 20 feet in height, reproduced from one made for a small hunting château of LOUIS XIII. at St. Germain. The narrow bands of steel of which it is constructed are connected at the four corners by open medallions containing reversed L's, in brass, which metal is sparingly introduced in the ornaments at the base of this noble chandelier. It is placed on a square block of Languedoc marble. The elegance of the design is marred by the utilitarian spirit of the age. The work is surmounted by a cluster of gas or other lamps, whereas a candelabra, with some hundred tapers, would have been in keeping with the period of which it is reminiscent.

Crossing the three salles devoted to retrospective art, we reach the fourth, where the works of an artist whose name has never sought the applause of the gallery, but which nevertheless is well known to the cognoscenti of Europe, cover a considerable portion of the wall-space. Commissioned to redecorate the "Salle des Poèmes" of the Palais de l'Elysée, by the President of the Republic, M. GALLAND has executed three panels of 12 feet square and six of 20 feet in length by 4. The design suggested by the name of the salle is of flowers entwined on an architectural encadrement; the garlands are borne by amorini, where the sculptural ornamentation ceases. The drawing, colouring, and pose of these boy angels form so attractive a portion of the work, it is with regret we observe somewhat ponderous vases as the central subject in the square panels, whereas a group of cupidons from M. GALLAND's brush would, with advantage, have replaced them. We congratulate the Amphitryon of the Republican festivals on his being enabled to relieve the cares of office by the dreams M. GALLAND's poetic fancy has evoked on the walls of the "Salle des Poèmes." Above these Elysée panels are two large subjects, entitled in the catalogue *Harmony* and *Music*, also due to M. GALLAND, but so effectually skied, in consequence of the great space his other works occupy, it is impossible to describe them as they deserve.

M. MAZEROLLE, to whose courtesy we have been indebted for many a classic design, exhibits here the drawing for the tapestry executed for VICTOR HUGO's "Le Roi s'amuse," which was produced with such lavish magnificence at the Théâtre Français, for which, it will be remembered, M. MAZEROLLE designed and executed the ceiling. The artist's exquisite *Wood Nymph Chasing Butterflies* in an infinite space of pale blue-green ether, exhibited in the neighbouring salle, reveals at once the qualities for which M. MAZEROLLE is pre-eminent. The lovely sprite rests on a branch of acanthus. She is hushed while watching the erratic flight of her winged prey, while at her feet a cupid, perched on a big acanthus leaf, holds an open cage to receive her prisoner. The boy's wings are discreetly folded. The composition is marked by grace and poetry. It is with pain we gaze on a series of panels on which, with the wild caprice of his most capricious fancy, *notre camarade* GUSTAVE DORÉ (as the Mirlitons with touching simplicity inscribed on his last work for them) has painted parrots in their native jungle. Who now can say with what purpose he evoked the gorgeous orange and purple and crimson birds overshadowed by a palm-leaf or perched on a bamboo, beneath a sky of sapphire, and threw them on these panels? Perhaps in the wild exuberance of a fit of gaiety which occasionally brightened the dejection which of late became habitual to him. These panels and a painting of an Egyptian queen seated on a throne in a niche of a wall, highly decorated by hieroglyphics, are drawn with minute and searching care. The executors have broken the *scellés* of his studio to procure them for exhibition. Very beautiful is M. BOULANGER's frieze for the adornment of the Hall of Marriages in the XIIIth arrondissement. The scene transports us to Greece in the days of PERICLES. The affianced are seated on a marble seat, raised by some steps from a terrace. They are surrounded by a legend in old lettering, which at first glance impresses one with the idea of their being saintly personages of the seventh or eighth century; but, on nearer study, we perceive their garments to be classical and their feet sandalled. To the left, quasi-kneeling, is a graceful figure, who scatters blossoms on the marble steps. Her dark hair almost conceals her features; a dark scarf is swathed round her breast, while the rest of her person is enveloped in a white robe, clasped on her shoulder by a brooch. From behind advance Athenian matrons and girls bearing gifts—*n'en déplaie à Madame JUDIC ET CIE.*

We are profane, and recognise well-known artistes who nightly brave *les feux de la rampe* at the Vaudeville, Odéon, &c. On the other side advance the men of Athens, who bear a strong resemblance to some living notabilities. First we have M. ALEXANDRE DUMAS, next to whom may be recognised the aristocratic profile of M. GÉROME; behind him M. CABANEL, and M. GARNIER, architect of the Opera House, are seen attempting to catch a good view of the bride. M. BOULANGER himself undertakes the office of scribe, and with his stylus engraves their names on a tablet. In the foreground, tall, stately M. GUILLAUME makes an excellent Greek; the sculptural cast of the drapery, as it falls from his shoulder, is admirable. M. BOULANGER has made a separate and most interesting pencil study of each figure, finished with the soft beauty and delicate richness of a drawing by LORENZI DI CREDI. Of these separate studies there are twenty, laid on grey paper and framed.

M. LUMINAIS is a great artist, and contributes a colossal canvas on which he has depicted a gentleman of the Mediæval period taking horse exercise on an animal we presume to have been of the far-famed Perrichon breed. We imagine that, could the distinguished artist exhibit the animal which occupies so large a space on canvas at TATTERSALL'S, it would excite no small amazement. Beneath the *Jeune Cavalier du Perche* is M. LOUIS LELOIR'S *La Pêche*, which would be attractive if it were only for the pearly light which fills the canvas, the soft opal tints on the noble's jerkin, and the grey-greens of the moving water, the lady's dress of gold and black damask being the only bit of intense tone in the whole. The boat sways with the flowing stream. Exceptionally good is the veteran M. MONGINOT'S panel, well suited to hall or dining-room. He has in a clever way grouped his musicians, who, through their flageolets and other pipes, summon wanderers to the midday repast. Promptly has the youthful châtelaine responded. She has tripped up the steps, carrying a pet peacock in her arms. Spite her haste she finds time to turn and roundly rate her page for carelessness in his manner of carrying her train of silver-grey brocade. This is the best large canvas M. MONGINOT has done for some time.

Panels are distinctly the order of the day. Room-paper manufacturers may accuse the Japanese for the revival of the old fashion; certain it is that their trade in France is just now at a discount. The most lovely among all those with floral designs are by Madame DESGRANGE, and that they should be so is small wonder, inasmuch as the lady is daughter of the well-known TOUDOUZE. The panels measure some 8 feet by 6 feet. A stately holly, at whose roots the crimson-leaved Virginian creeper has flung its richly-tinted leaves, is the subject of one; a rhododendron, on whose lilac and rose blossoms every lovely hue seems to have fallen, that of another. The background of these is light, of the creamy gold tinge of evening. Of the third, painted on a ground of pale grey, the subject is a single plant of the double rose-poppy. There is masterly freedom of touch, grand style in the drawing, and rich and varied tone of colour seldom combined in the work of a woman. But while we render justice to Madame DESGRANGE, let us not omit to attract attention to a noble flower-piece by M. AUBLET, entered simply as *Chrysanthèmes*. In a huge pot of green lustre pottery two plants have striven for existence. To one, life has been an easy matter. Pale gold tassel-like blossoms abound on its strong branches; here and there a knot of the indented and notched leaves find room to display their blue-green tint. The other chrysanthemum puts out its work-a-day brown flowers where he can, his humbler garb serving admirably as a foil for the stately elegance in form and colour of his aristocratic neighbour. The pot of Spanish lustre has been carelessly pushed on the cover of pale azure plush, which in its wrinkled condition catches silvery light, and throws back dark shadow. The wall is hung with untanned leather. M. TOURNIER sends *Aurora*, who has caught the blind boy in her arms, and by means of a zephyr, which inflates her roseate scarf, cleaves her way through space towards Paphos—that is, across a ceiling; and we are insensibly guided to the left, and find ourselves opposite M. CHAPLIN'S works. M. CHAPLIN, in the palmy days of the Second Empire, at the bidding of the Empress, decorated three of the salons of her private apartments at the Tuileries. The first he made sea-green, the second rose, the third blue. On these delicate colours the Seasons and other suitable subjects were executed in grisaille by him

and M. DUBUFFE. The chimney-piece of the green salon was of black marble, with delicate wreaths of gilt leaves on its architrave, that in the rose-coloured salon was of lapis lazuli, its jambs ending in acanthus-leaves beautifully chiselled. Now MM. CHAPLIN and DUBUFFE'S *chefs-d'œuvre* are swept from the surface of the earth, as these lovely works will soon be from the memory of man. One panel at the exhibition represents *Harmony*, a young girl nude to the waist, the pink and rose of whose flesh tints are of the freshest, her pose of the most enticing. *La Nuit*, by the same artist, is typified by a woman of faultless symmetry, reclining on billowy clouds by the light of the silver moon. There is hardly a peculiarity of the master remaining unrepresented in these two works—the flowing contours, the roseate flesh tints, the chiselled features, the peculiar *Parisienne* expression in the eyes, the small hands, and the transparence and modelling in the skin—but the handling is rather slight. In *La Peinture*, destined for a *dessus de porte*, the swimming haze which covers the form all but confounds the flesh with its accompaniments of wavy hair and dress in a *cento* of sparkling colour.

M. BRATEAU has revived the well-nigh lost art of *repoussé* work in tin with marvellous success. He exhibited some examples of his skill in 1876, and now contributes a plate, which is most delicate in its ornamentation. In the centre is the monogram of LOUIS XVI. on a *champ semé de fleurs-de-lys*; the series of bas-reliefs executed on the edge of the plate and following the undulating curves of its external line are gems of *repoussé* work. M. BRATEAU has presented some smaller tin plates to the Museum, and exhibits two fine fan supports of gold embossed and engraved, the design worked out in alto-relievo. A ponderous tome bound in wood is decorated by *repoussé* work in tin with a delicacy and sharpness of execution worthy of all praise.

PARIS NOTES.

DURING the demolition of a house in the Rue des Fossés-Saint-Jacques there has been found, at a depth of 13 feet below the surface, an antique statue that appears to belong to the Early Byzantine school of art. The sculpture represents a full-grown youth leaning with his back to a pillar, and supporting on his head a heavy capital carved in vine-leaves and bunches of grapes. The hair is curly; on the shoulder appears the buckle of the *paludamentum* or cloak thrown behind him. The right hand is missing, and all one side of the face and upper part of the body have been severely scratched and knocked about. A photograph of the statue was shown at a late meeting of the Académie des Inscriptions et Belles-Lettres, and discussed at some length, the prevalent opinion being that it is a figure of Bacchus, and had served as a support or caryatide to an altar of that divinity.

A bronze bust of Henri II. of France, exactly similar to the marble one of the same king contained in the Louvre Museum, has just been discovered in the collection of M. de Humbstein. Both these works are undoubtedly the work of Germain Pilon, the celebrated sculptor, who is known to have executed busts of several kings in three kinds of material—terra-cotta, marble, and bronze.

The artist, Charles Jacques, has written an interesting letter to a Paris paper in reference to the masterpiece of Delacroix, lately presented to the Louvre by Madame Moreau. The title by which this painting has been wrongly known for nearly forty years is *La Barque de Don Juan*, as if it were intended to depict an incident in the shipwreck of the gay wanderer of that name. Such, however, was by no means the intention of the artist, who simply desired to portray a situation that had actually occurred and been related by the journals of the day: some sailors, escaped from a wreck in one of the boats of their lost vessel (the *Don Juan*), in the act of drawing lots to determine who should be first sacrificed to satisfy the hunger of the survivors; and the true title given to the picture by Delacroix was *Les Naufragés du "Don Juan."* M. Jacques further relates that in 1845 this *chef-d'œuvre*, now estimated to be worth at the least 150,000 francs, was exposed for sale during some considerable time at a picture-dealer's named Scheradam, on the Boulevard des Italiens, and was actually offered to himself for 1,300 francs, with a sort of apology for that high price on the ground that the frame was worth at least 150 francs. "Unfortunately," M. Jacques remarks in conclusion, "at that time this figure was far too high for me."

The Egyptian museum at the Louvre has just received an historical treasure in the shape of a gold ring, bearing the name of Tai, the wife of Amenotepe III. Two other gifts have lately been presented to the same collection—a private contract in hieroglyphics, received from an English missionary, and a small urn in chiselled bronze, presented by an English member of Parliament. The Louvre has further received, during the past week, from the collection of Baron de Schwyther, nine drawings by Demoustier and his ablest pupils, including portraits of Marshal d'Ancre, Madame de Longueville, Louise de Lorraine, de Thou, the historian; the Connétable de Montmorency, and the Jansenist Saint-Ciran.

On Wednesday, the 25th inst., an exhibition of portraits of celebrities of the last hundred years, 1783-1883, was opened in the galleries of the Ecole des Beaux-Arts on the Quai Malaquais. This exhibition is most interesting, as it brings together the masterpieces of French portrait painting, and thus affords a means of comparing the works of such artists as David, Gérard, Proudhon, and Ingres, with those of their rivals of the modern school; and also as it renders the spectator familiar with the features of almost everyone of either sex who, during the past century, has attained celebrity in France in war, politics, literature, art, or science. The proceeds of the exhibition are to be handed over to the Philanthropical Society, in aid of a new night refuge for women and dispensary for children that have lately been opened under the auspices of that body.

The Union Centrale des Arts Décoratifs is in negociation with the Minister of Fine Arts for the concession of a portion of the Palais de l'Industrie for the reception of its collections, which cannot possibly be displayed to advantage in the limited space afforded by the City of Paris Pavilion. The concession would be only a temporary one, lasting until the completion of the great Museum of Decorative Art, the construction of which will be undertaken by the Union Centrale with the funds resulting from the lottery organised under Government patronage specially for this purpose.

The Salon Jury of Sculpture, which has elected M. Guillaume president, M. Mathurin-Moreau vice-president, and Messrs. Etienne Leroux and Aimé Millet secretaries, finished its task of elimination on Monday last, with the result that 160 figures or groups, and about 450 busts, are admitted to the exhibition. It has been arranged that the main gallery shall be occupied by the following groups: *A l'Immortalité*, by Lemaire; *Décapitation d'un Evêque*, by Fagel; *Gladiateurs*, by Noel; *Printemps*, by Cordonnier; *Premières Funérailles*, by Barrias; *Porte-Flambeau*—an equestrian statue for the Hotel de Ville—by Frémiet; *Aveugle et le Paralitique*, by Turcan; and *Projet de Tombeau*, by De Lavingtrie. The circular space in the middle of the sculpture section will have no central group as last year, but 40 busts will be ranged round the walls.

The painting section of the jury of the Triennial Salon, the composition of which was given in our last week's notes, have elected M. Meissonnier, president; MM. Gérôme and Cabanel, vice-presidents; and M. Paul Mantz, secretary; while in the architectural section of the same body M. Ballu has been appointed president; MM. Boullain and Boeswilwald, vice-presidents; and MM. Brune and Ch. Garnier, secretaries. At the first meeting of the jury, M. Jules Ferry, President of the Council and Minister of Fine Arts, announced that the applications for permission to exhibit received up to the present time were as follows: Painting, 296 artists for 676 works; sculpture, 134 artists for 302 works; architectural, 35 artists for 56 works; engraving, 73 artists for 187 works. Thus, without taking into account the further numerous applications that are sure to be received, the work of the jury has already become one of elimination.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute was held on Monday evening, Mr. David Brandon, vice-president, in the chair. Mr. A. Beazeley, M.I.C.E., read a paper entitled

Notes on Domestic Dwellings in Southern Sweden.

Mr. BEAZELEY began by saying that he had felt somewhat at a loss for a subject, owing to his limited knowledge of architecture, but having resided for some years in Sweden, it had appeared to him that a few notes on the domestic buildings of that country might be interesting. The paper was illustrated by drawings of

the buildings, and constructional details, alluded to by the author in his paper. The lag-stofva type of farmhouse of the southern provinces was described in detail. These buildings were of wood, constructed of logs or slabs, having thatched roofs, and were often covered with turf. It was not uncommon to see goats feeding on these grassy roofs. A peculiarity was mentioned in connection with the fireplaces; it was the fixing of a large slab of stone over the fire, which, in addition to being used for cooking purposes, served also as a vapour bath. These primitive buildings were derived from the type of dwellings erected by Gothic immigrants when first they sought out fixed abodes for themselves, and, with various modifications, were found through the whole of the Scandinavian kingdom. Certain features which the author pointed out were, however, wholly peculiar to Southern Sweden. Somewhat striking features of later times were the self-contained town dwellings to be found in Stockholm, Gottenburgh, and other towns. Semi-detached dwellings were also found in the suburbs, but a large proportion of the inhabitants of towns lived in flats, which were fair types of good middle-class dwellings. The internal arrangement of the flats was described. The rooms opened into each, and on occasion of the reception of company or visitors they could be thrown open. Bed-rooms were commonly used as sitting-rooms, the beds being telescoped up in the daytime. Brick and stone were generally employed as building material. Gneiss or granite, rough hewn, was employed where nothing else was procurable. The author then alluded to the use of dry walling. Dry stonework was extensively used for piers and abutments of railway bridges, even when carried to a considerable height, and proved very effective. After describing Swedish bricks and tiles, Mr. Beazeley gave an elaborate explanation of the construction and working of tile stoves. The top of the stove reached within a short distance of the ceiling of a room. They were made thus large in order to get all the heating surface possible. Billets of wood were burnt in them, the doors being left open till the fuel had ceased flaming and was in a glow. The stove when shut was practically hermetically sealed, and would, without further attention, give out heat for six or seven hours, or even longer, if the weather was not exceptionally cold. Sitting-room stoves were provided with a recess in which plates, &c., could be warmed; and stoves for bed-rooms had a like arrangement for the airing of linen. In the place of wood as fuel, probably anthracite coal or coke would be found the best substitute. The stove could not, however, be closed till the glow of the cinders had moderated, and in some respects there was an advantage in wood as fuel. The remainder of the paper was devoted to details of joinery, which differed most from the practice of this country, and a description was given of flooring, doors, and windows, with observations on their remarkable weather tightness, the use of double windows, &c. In conclusion, the author advised those who had the opportunity of travelling to visit Sweden. Anyonewho spent a vacation there would assuredly desire to repeat his visit.

Mr. L'ANSON proposed a vote of thanks to Mr. Beazeley for his paper, and observed that he himself had had the pleasure of visiting Sweden. The buildings described in the paper existed, he said, not only in Sweden, but were to be found in Norway, and right away up to the North Cape in the furthest habitable regions of Europe. They differed totally from any of the western buildings. Mr. L'Anson contrasted them with the buildings of Southern Germany and France, one distinctive feature being the moderate pitch of the roof as compared with the steep pitch which prevailed in Germany and France. It was only necessary to see the vast forests which extended throughout the whole of Norway, and parts of Sweden, to understand how valuable they were as a means of erecting these dwellings. He did not quite catch what the lecturer had said were the materials employed for roof coverings, but he had understood him to say thatch. In Norway the more common covering was the bark of the birch tree, which acquired a greater size in that country than with us, and formed a remarkably good roof, proof against wet. The architectural decoration was not at all derived from Western Europe. It must have come from the East, carried by the civilisation of the Byzantine Empire along the great rivers of Russia. The Runic decoration, as it was called, the interlacing, serpent-like ornament, was Byzantine, brought through Russia into Europe. Not the least interesting part of the lecture was that on the construction of stoves. They were to be seen throughout the whole of Germany and in France, and it was often a matter of wonder what the inside was like. Some explanation was required before the arrangements could be understood. They were all formed with internal chambers or flues. The smoke and heated-air current had to go through a series of flues, and was made in this way to take as circuitous a route as possible, to get as much benefit from the heat, before it passed into the flue by which it escaped. He wondered why such stoves were not more used in England. He understood that Messrs. Doulton were making something of the kind, and no doubt they would come to be used.

Mr. FOWLER seconded the vote of thanks. He said he could add his testimony to Mr. Beazeley's as to the effectiveness of the form of floor and ceiling described, as he had seen the same in Germany, more especially Northern Germany. They were exceed-

ingly fire-resisting, so much so, that in a large house where there was fire in one flat, the tenants of the other flats were very little alarmed; and, beyond going out of the house themselves, they did not take the trouble to remove their furniture. In Germany window-sashes were almost always made of oak, and did not depend on mere lapping for weather tightness. They were made with round and hollow joints, the two flaps were closed together, and thus great air and weather tightness was obtained.

Mr. WYATT PAPWORTH said he had on one occasion adopted what in Ipswich was known as a "saddle," and thus most effectively cut off draught from under doors.

Mr. JOHN HONEYMAN said he had observed a great analogy between the work that had been described, and what was common in Scotland. The two countries, Sweden and Scotland, were thrown more or less together in early times. From the earliest type of building the same arrangement existed. Stone was used instead of wood, otherwise this arrangement existed in the Highlands to the present day. Then, again, the Swedish town dwellings had a resemblance in common with the northern towns, in the use of flats, a large proportion even of the better dwellings being arranged in flats. In some of the older houses the arrangement by which one passed from one room to another might be found, but it was a plan entirely given up now. Mr. Honeyman also alluded to the ceilings and floors, as exhibiting a similarity of construction in the system of pugging and plaster employed, and said that the officers of the fire-brigade had testified to the ease with which fires were got over in consequence of the fire-resisting nature of the ceilings. Mr. Honeyman concluded by asking the lecturer how Swedish houses compared with ours as regarded healthiness.

Mr. EDMUNDS said he had travelled in Sweden, Norway, and Denmark, and had seen, used as a covering for roofs, shingles dipped in some composition to render them unflammable. They looked very picturesque, and he would like to have Mr. Beazeley's experience as to their use and efficiency.

Mr. PAYNE, in reference to stone walls, said that in Cumberland the local stone-masons used mortar for the outer face of the walls, but not on the inside. The walls so built were perfectly dry on the inside, whereas in ordinary built walls the wet seemed to be sucked through as by a sponge.

The CHAIRMAN said the observation with regard to the dryness of walls built without mortar was singular, and worth noting. In South Wales he found that building walls dry on the inside, and giving a dip downwards to the stones, led to the walls drying sooner than they otherwise would. The chairman then put the vote to the meeting, which was carried.

Mr. BEAZELEY, in reply, said, in reference to the roof coverings, that sheets of birch bark were first laid on and then tied down, generally with withes, to the rafters; on this turf or thatch was laid. Almost invariably birch bark was in the first instance laid on, even under burnt clay tiles, when used. The sashes of casements, so far from being of oak, were slight, and made of fir, with an inch and a half plate screwed on to the outer and inner corner to strengthen them. This showed that no great pains were taken to make the sashes stout. Mr. Papworth's remark on the "saddle" was interesting, inasmuch as it showed that in England the same ideas had been tried. To Mr. Honeyman's question as to the healthiness of the dwellings, he could give no satisfactory answer, as he was not aware whether the houses were considered healthy or not. If they were, it was a wonderful instance of the strength of the Swedish constitution, for there was no ventilation in the houses. He had known houses in which not a single casement was made to open during the winter, so what with double windows, &c., to keep out the cold air, the only ventilation was when the door of the house, or the damper of the stove, was opened, and this was not often the case. In nearly all the towns in Sweden the use of shingles was prohibited. How far rendering them unflammable would make a difference he could not tell. Mr. Payne had inquired whether he had intended to say that mortar was entirely excluded from the walls. What he had said was that they were dry built. In the use of foundations the joints might be pointed with mortar, but lime was expensive, and it was a saving where its use could be dispensed with. For the stonework of the bridges he had spoken of, not a particle of mortar was used. For piers, over 40 feet in height, some 4 feet were flushed up with mortar, but above that were dry built.

The meeting then adjourned.

THE NEW TAY BRIDGE.

THE contractors for the new railway bridge, which is to take the place of the structure that was destroyed in December 1879, may be said to have completed their arrangements. Messrs. Arrol have obtained the use of about four acres of land at Dundee on which to erect workshops and store materials. Ground has also been obtained on the south side of the water, as it is intended that operations shall be carried on simultaneously from both ends. The whole of the ironwork, however, will be prepared at Messrs. Arrol's foundries in Glasgow, where it can be better manipulated than in any temporary premises run up on the spot, and will be

brought to the ground in convenient sections ready for fitting together.

The new girder bridge, of which Messrs. Barlow, of Westminster, are the engineers, is to span the river about thirty yards to the west of the ruined structure, no part of which is to be utilised. The piers, erected in pairs, will number 86, the distance between them varying from 66 to 245 feet—the long spans being in the middle of the river, where the bridge will have a headway of 77 feet above high water. This is 11 feet lower than the extreme height of the old bridge. One important difference between the old and the new bridges is, that whereas in the former the piers were of cast iron, in the latter most of the iron will be malleable, which, of course, will add materially to its strength. The principle on which the piers are constructed is entirely different. Further, the new bridge will carry a double line of rails, while on the old bridge there was only a single line.

The following special description of the bridge appears in the *Scotsman*: On the north side the new bridge will begin at the bowstring girder of the old structure, which carried the railway over the road leading to Magdalen Green. The girder and its supports will be removed, new piers erected upon the same site, and a fresh girder provided. Counting from this point, the foundations of three new piers have been put in. These have been built of brick, each 32 feet in length by 7 feet in width, and are distant from each other 66 feet. These piers rest on the whinstone rock, at a depth of 4 feet below the level of the ground, the inequalities on the surface of the rock having been filled up with concrete. Each of these piers has a coping of granite, and atop of it will stand four cast-iron columns, 3 feet 6 inches in diameter, and about 15 feet high, firmly held down by sixteen bolts, built several feet into the brickwork. The girders will rest on the top of these columns. The next three piers will be of skew pattern, and are designed so as to facilitate the extension of the Esplanade in a westward direction. These skew piers, which will be constructed from their base to the girders entirely of brick, will carry the bridge out beyond the low-water mark. For the foundations of all the other piers, save four at the south side, massive iron cylinders will be used. In the shallow water off the north shore these will be of cast iron, and in the deeper water beyond of malleable iron. One pair of cast-iron cylinders has already been put in, and another is being sunk. The sections of these cylinders, with the exception of the one placed lowest and that immediately above it, are 6 feet in length, 8 feet in diameter, with a thickness of 1½ inches. The flange, carefully planed, is 6 inches wide, and the bolt-holes about an inch across. The lowest section is 10 feet in diameter and 2 inches in thickness, and the next is tapered off to bring the pier into 9 feet. The distance between the two cylinders forming each pier, measuring from west to east, is 26 feet, and they will all be carried up to a height of 8 feet above high water. The span between these cast-iron piers, of which there are twenty-three in all, will be about 70 feet, and on them the bridge is taken out to the end of the curve on the old bridge, or about 1,600 feet. Beyond that point, malleable iron cylinders, varying from 15 to 23 feet in diameter, will commence and be continued to within a short distance of the other side. The span between the deep-water piers will be much the same as those of the old bridge. At the gap the new piers will be built in the exact line of the old ones—the extreme width of the spans in the centre being 245 feet. As will be seen, the piers in the centre will be of great breadth, the 23 feet cylinders being intended for this part of the river.

Between the two cylinders which constitute the base of each pier an iron girder about two feet in depth will be laid: above this the pier will be continued in blue Staffordshire brick for seven feet; and from this point a superstructure of malleable iron, braced with angle and T bars, will be carried up to meet the girders. This superstructure, beginning at the seventh pier from the Esplanade, will vary in height according to the gradient of the bridge, which averages 1 in 114 feet. Blue brick is being used, as it is harder and better fitted to resist the action of the water than the common red variety. The girders will be of the ordinary lattice description, and of the same depth as those on the old bridge. The floor of the bridge will be wholly of iron. The rails will be laid on the top of the girders except at the part of the structure opposite the gap. There they will be fixed upon the bottom of the girders. It is intended to erect wind screens on the bridge, but what shape these may take will be a matter for further consideration. We believe that in connection with the works at the Forth Bridge experiments with screens are being conducted to determine the velocity of the wind; and the engineers will probably be largely guided by the results there obtained. On the south side of the Tay, where the river has high banks of rock, the bridge is carried out to the deep water on four brick arches, supported by brick piers rising from the rock below the bed of the river. These piers are protected by cut-waters with granite copes—the current at this side being often very strong. The abutments and wing walls of the first of these arches have been built.

The method employed for sinking the cylinders in the bed of the river is much superior to that which was in vogue when the old bridge was erected, and renders the workmen entirely independent of wind and tide. Except in the event of anything going wrong, no divers are required. In this important and difficult part

of the undertaking a large iron pontoon, weighing about 100 tons, is used. Piercing at each corner the huge tank of which it is composed are four heavy cylindrical "legs," upon which it may be said the pontoon is hung—part of the "legs" being under water and part in the air. The pontoon is floated over the exact spot where the piers are to be sunk, and, the legs having been let go, pierce the bed of the river, and hold the pontoon fast. Then the pontoon, by means of hydraulic jacks, is lifted clear of the water—three, four, or five feet, if necessary—and worked from this elevated platform, no weather can disturb the sinking operations. Cut in the pontoon are two apertures, the exact distance apart that the pair of cylinders should be when in position, and upon it are a pulsometer, steam-crane, and apparatus for working a patent excavator. The cylinders are floated out to the pontoon in sections, firmly bolted together upon it, and lowered to the bed of the river through the apertures—there being mechanical "guides" to keep them upright in their descent. The patent excavator is then set to work to dig out the soil enclosed by the cylinder; and as that is cleared away the massive iron frame slowly sinks into the bed of the river. In sinking the cylinders at the north side a bed of tough red till or boulder clay was encountered, and upon that the pier in question rests. The "digger" is capable of lifting about a square yard of material at a time; but the progress it makes is, of course, entirely dependent on the nature of the strata through which the cylinder has to pass. On getting into the clay the cylinder becomes watertight, and the water in it is pumped out. Workmen can then descend, and proceed to make the pier solid by means of brick and concrete. In so doing there is first of all a layer of concrete, 15 feet thick, spread on the bottom, and upon this a ring of brickwork is built up to the top of the cylinder—the bricks "butt" close to the iron. The central cavity is afterwards filled with concrete, and the pier thus becomes a structure of great solidity. A larger pontoon constructed on the same principle is to be employed at the south side of the river, where it will probably make its appearance in the course of next month.

For the floating out of the cylinders a wooden jetty, on which is a steam crane, has been built at the end of the Esplanade; and within the yard previously referred to are two powerful travelling steam cranes, concrete mixers, and appliances in the shape of tipping bogies and other convenient forms of waggon for conveying material to the bridge. On the south side there is also a jetty communicating with the yard there by means of an inclined railway; and there are also all the necessary machinery for the lifting and transit of stone and iron. In reference to the discussions which took place at the Board of Trade inquiry as to the tendency of concrete deposited in iron cylinders to expand and contract, it may be mentioned that all the Portland cement used in these works will, as a precautionary measure, be exposed in tanton lots to the air in large sheds for a month. In that way it will be thoroughly cooled before being mixed. In the yard on the north side are about 100 sections of cylinders of different sizes; the delivery from Glasgow being at the rate of four or five a week, so that during the summer there is no likelihood of the workmen at the bridge getting beyond the manufacturing capacity of the foundry.

The officials responsible for the construction of the bridge are Mr. Kelsey, M.I.C.E., the resident engineer for Messrs. Barlow; and Mr. W. Inglis, C.E., the resident engineer for the contractors. The bridge, which is to cost about three-quarters of a million sterling, is expected to be finished about the end of 1885.

THE ACCIDENT AT KINGSTON MILLS, STOCKPORT.

THE inquiry into the origin of the fall of the roof of the Kingston Mills, Stockport, which caused the death of five men and injury to several others (see *The Architect*, March 31), was concluded on the 19th inst.

By direction of the Coroner, Mr. John Eaton, F.R.I.B.A., of Ashton-under-Lyne, examined the building, and prepared the following report:—

"I have made a careful examination and inspection of the building where the accident occurred, of the beams and pillars taken out of the débris, and of the plans prepared for the alterations before the commencement of the work and during its progress, and in giving my opinion I wish to say that I fully enter into the gravity of the question, and desire to approach it with the caution it demands. My first visit to the scene of the accident was on the 31st ult., with my partner, who on this occasion assisted me. On the following day I went again and made a lengthy examination, and also on the Monday and Tuesday following. I have attended the adjourned inquiries on the 5th and 12th inst., and heard the evidence given. After very careful consideration of the whole, I am of opinion that the evidence given does not quite go to the root of the matter, and that a further cause or causes must be sought to account for the disaster. During my second examination I found that the back wall of the engine-house had separated about the second storey as much as $1\frac{3}{4}$ inches from the west wall of the

engine-house, and although I do not know that this was so previous to the accident, when taken into account with what the clerk of works says, I do not think the accident was the cause of the whole of this fracture. I have also measured the beams which carried the last floor and the roof respectively, and calculated their strength and load, and have caused several of the columns to be fitted or tried upon their supposed interchangeable sockets, of one of which I have caused a model to be made for your information. On March 31 I examined seven of the column tops which had been taken out of the débris, and of these three showed marks of the bases above them having respectively rested upon the boss for the tie rod instead of upon the end of the column. In order, however, to account for the accident we must go back to the time when the removal of the engine bed was taking place, and remember that 8,000 cubic feet or about 570 tons of stone, some blocks of which were six tons each, had to be moved from its seat, and finally, in order to load it, swung out with a cathead which was secured at one end to the beams carrying the arching, the other portion resting to some extent upon the back wall, which below this had two windows in it of three storeys high each, and I am of opinion that at this time some disturbance or vibration must of necessity have been caused which would have a weakening effect upon arches so shallow as fire-proof arches, which are only in the centre a bed or joint of $4\frac{1}{2}$ inches. The next point to examine is the strength of the old beams before mentioned and their load. The safe load of these I find to be 7 tons 12 cwt. each, whereas the central ones were carrying each about 9 tons of arching, whilst the roof beams had, in addition to this, to support about 7 tons of water, in all 16 tons. In other words, they were loaded with about $\frac{3}{4}$ of their breaking weight, being considerably beyond the proof load, which should not exceed $\frac{1}{2}$. When we consider that the evidence proves that the whole of this weight had settled at least $1\frac{3}{4}$ inch whilst resting upon wooden props, which in turn were set, in one case at all events, upon the bare concrete covering the arches and otherwise upon a plank resting on the same, it seems easy to realise that the raising up again of the whole of this weight must have had a weakening effect upon both the arching of the roof and that upon which the props and jacks were supported, whilst at the same time the brickwork of these arches was thoroughly saturated with water, shown in some instances to have been trickling through the joints. My opinion as to the weakness of these old beams is, to some extent at all events, confirmed by the fact that in the original drawings no pillars are shown to divide this load, but later, and whilst the work was in progress, it was decided to insert a column in the centre of each beam to relieve it. I now come to the question of the casting of the boss or preparation for the tie-rod, which was too high upon the column, and thus prevented the base from resting solidly in each case upon the column below it. I have no doubt from my examination that this was so, and that when the shock came of at least two of these columns bursting off a part of the flange which clipped the head of the one underneath, and thus making a sudden drop of at least five-eighths of an inch, that it would still further loosen the whole and hasten a conclusion which might have occurred even without it. This breaking of the base of the column may have been, as Mr. Potts says, and probably was, 'the last straw.' Still I do not think it was more than 'the last straw,' but that a gradual process of weakening the structure by various strains and bad weather jointly, and in addition to this that, in my opinion, the beams were overloaded, and after a subsidence had to be jacked up to their places, thus increasing the strain, followed by this shock, brought about the catastrophe. I am of opinion that this last cause of itself in this case would not have brought down the whole, as the skewbacks which rested upon the strengthening beams were on the outer side of the engine-house, and even if these beams had followed the drop of the column and left the whole of the weight for the skewback to bear, the space between the beam and skewback would probably have been seen, one would think, by the clerk of the works upon his careful examination between the time of the bursting of the base of the column mentioned and the accident; but granting this to have been so, if the beams before mentioned had been strong enough and the arching sound, in my opinion the arching above the engine-house, being turned as it was at right angles to the other portion of the mill, ought to and probably would have stood independently."

The Coroner in addressing the jury said, that from the evidence he did not think there was sufficient ground to justify them in bringing a verdict of manslaughter against any person. But if the jury found that the accident happened in consequence of carelessness, want of skill, or want of proper judgment on the part of any person connected with the work, it was for them to make any observations they might think necessary. For himself he could not help feeling that if proper care, skill, and caution had been exercised the accident would not have happened.

The jury said that, without casting any imputation on the proprietors or manager of the mill, they found that the death of the several persons whose lives had been lost occurred by accident brought about by various causes, through errors in judgment of the various parties in carrying out the alterations that were being made at the mill.

NOTES AND COMMENTS.

A COLLECTION of pictures by Impressionist French painters was opened by Messrs. DOWDESWELL in Bond Street on Saturday last. There are landscapes by SISLEY, scintillating with light, and spotted with formless semblances of foliage, land, water, and sky, in which the chief aim seems to be to avoid outline, and to paint light and shadow on the principle of complementary colours. There are clever but inchoate heads and bodies by M. DEGAS and his pupil, Miss CASSATT; blottesque portraiture of dreary aspects of nature by MONET; a few bits by M. JOHN L. BROWN, which have little in common with the surrounding work, for though this artist is said to have joined the society and to work on their principle, his habits of distinct expression abide by him. Whether this collection is really a representative one we do not pretend to judge; but we have certainly seen Impressionist work which had more pretension than anything here to the name of art. If the principle of the school is that the object of a painter should be to give a version of nature which shall not be imitation, but an interpretation of the mental image or swift impression produced on the mind, still that is no reason why he should not use the clear language of his art or choose worthy topics. And there seems no reasonable call for us to fall into raptures over the blurred suggestions of hats and feathers on a milliner's counter, or the ungainly *pose* of an ugly ballet-dancer, or the distasteful forms of some stupid-looking children, merely because M. DEGAS and M. MANET choose to say they are artistic "impressions."

At the same time and place is shown the picture of the church scene in the Lyceum representation of "Much Ado about Nothing," commissioned by Mr. IRVING of the clever young actor and painter, Mr. FORBES ROBERTSON. The less said about the quality of the performance the better. Strange to say, the usual formula must be reversed in this case, for Mr. ROBERTSON might have done better if he had taken less pains. But it is not given to many men to shine in two arts, and Mr. ROBERTSON may be content with his success on the stage.

A SPECIAL general meeting of the Surrey Archæological Society will be held in the ancient chapel of the archiepiscopal palace at Croydon to-day (Saturday) at three o'clock, under the presidency of Mr. GRANVILLE LEVESON-GOWER, F.S.A., Vice-President of the Society. The following papers will be read: "The Archiepiscopal Palace at Croydon," by Mr. J. CORBET ANDERSON; "The Architecture and Heraldry of Croydon Palace, as Illustrative of its History," by the Rev. J. CAVE-BROWNE; "The Archbishops of Canterbury and their Palaces," by Mr. GRANVILLE LEVESON-GOWER, F.S.A.; "Suggestions as to the Derivation of the name of Croydon," by Dr. ALFRED CARPENTER, M.D., M.R.C.P.; and "The Documentary Annals of the Archbishops at Croydon," by Mr. S. W. KERSHAW, F.S.A. The meeting is called in conjunction with the Croydon local committee, with a view to the preservation of the ancient building, which is at present threatened with destruction.

THE "war pictures" exhibition of the Fine Art Society will be among the most popular of the season. M. DE NEUVILLE's *Tel-el-Kebir*, with the kilted Highlanders scrambling like cats up the outworks, is both a success and a failure. Capitally painted, luminous, full of admirably spirited figures (the young trumpeters sounding the attack are splendid), yet as a whole the composition wants cohesion. Either more or fewer figures would have brought balance, and prevented the excessively spotty look of the canvas. In the two sketches of the subject the artist seems to have struck upon better compositions pictorially than he eventually worked out. It must also be allowed that for the sake of effect the depth and width of the trenches have been somewhat exaggerated. But M. DE NEUVILLE can bear a few criticisms; his vivid and manly art will outlive them. Mr. CATON WOODVILLE will not fail to impress the outsiders by his very dashing performance, *Kassassin*, with the onslaught of the Household Brigade. Moonlight and stars, the smoke of cannon and flash of firearms, rearing horses, scarlet-coated British, parti-coloured Egyptians, the living and the dead, all mingled in purposed disorder, such

are the elements of Mr. WOODVILLE's ambitious canvas, the whole painted with a somewhat coarse breadth, and challenging comment on the assailable attempts at foreshortening and other difficult matters. Soldiers shake their heads dubiously at Mr. WOODVILLE's picture, but the non-technical onlookers are taken by storm, and, when not too much puzzled, are loud in admiration. Mr. WYLLIE's two pictures of the *Bombardment of Alexandria* by H.M.S. "Condor" and "Alexandra" seem a little too obviously made up of blue and white paint; the water is very blue, and the smoke from the guns is very white. Nevertheless the pictures are undeniably strong. The great war ships ride grandly on the water, huge and heavy, yet swinging safely at their firing-posts, and the skill is great with which the artist has indicated the impetus of the shell through the air, and the flop in the water of the enemy's return balls. The pictures are more narrative than artistic, but the narrative is forcible in the painter's hands.

MR. H. SAXON SNELL, F.R.I.B.A., has printed an account of some experiments undertaken by him to test the accuracy of registering anemometers. Mr. SNELL says the results of the inquiry prove that the registering dials of anemometers, which were made for him presumably with special care, as corrected by the instrument-makers' formula, were entirely unreliable, and it may, therefore, be very fairly assumed that the deductions hitherto arrived at and published by the numerous eminent experimenters using this description of instrument for testing the velocities of air in ventilating shafts and mines are similarly unreliable. The Sanitary Institute of Great Britain a few years ago delegated a committee to carry out a series of experiments for the purpose of ascertaining the efficacy of various patterned cowls placed upon upright ventilating tubes, as compared with the same tubes opening into the air without covering of any kind. The results arrived at were not considered satisfactory, and further tests were determined upon. Mr. SNELL sent an account of his experiments to the committee, and he believes that similar tests to his own are now being carried out.

O'CONNELL when consulted by a military officer who had been transformed into a judge for some colonial settlement, advised him to give his decisions boldly, but under no circumstances to explain how he arrived at them. Architects who are appointed to examine designs might do well to bear the advice in mind. Mr. WORTHINGTON, of Manchester, would have been spared the trouble of reading some very long letters if he had done so. He lately examined seven plans which were submitted by seven local architects for a chapel in Birmingham, and placed one by Mr. COSSINS first, on the ground that it most fully complied with the instructions. But, unluckily for his peace of mind, Mr. WORTHINGTON suggested how the design could be improved, and in describing the designs to which the second and third places were allotted, he also became critical. As might have been expected, the advice has not been accepted. The report has been put under the microscope, and the information concerning the defects which are supposed to be found in it have been freely communicated to the author. The case shows that there are some advantages in withholding a referee's reports.

THE new magazine, *Merry England*, which is bright and readable throughout, contains an extract from a letter written by Mr. HERKOMER from America to a friend, concerning the house he is about to erect at Bushey, and which has been the great dream of his life and of his father's life. "It is," he says, "to be a house which shall stand as a lasting monument of the skill of three or even four HERKOMERS—my father, my uncle, and another uncle who is a weaver, and will make all the curtains. My uncle JOHN is an exceptionally clever carver; and through this plan his troubles in life (of getting his honest work to compete with that of men of doubtful ways) will be over. I built before I left home large workshop studios, in which everything connected with the house is to be made, and here we have selected the best of the necessary time-saving machinery, and have learnt much generally in methods, means and ways that only the ingenious American is capable of. All this is to be started in the autumn, and the whole inner structure, with its elaborate carving, is to be finished before we touch a brick."

DIAGRAM SHEWING PROPOSED DECORATION OF A PART OF THE DOME OF ST. PAUL'S CATHEDRAL.

DESIGN FOR THE DECORATION OF THE DOME OF ST. PAUL'S CATHEDRAL.

WE publish this week a rough sketch or diagram to indicate the nature of the proposed scheme of decoration for the dome of St. Paul's Cathedral, on which Mr. POYNTER, R.A., is engaged. The following description accompanied the original model of the segment from which the sketch has been taken:—

The dome will be divided into eight parts by upright architectural ribs. In each space between the ribs will be two large round panels, 20 feet 8 inches and 12 feet 8 inches in diameter respectively. Round the base of the dome, and supporting the circular panels, will be eight thrones or architectural seats, one of which is shown in the model, and contains the figure of St. John the Evangelist receiving inspiration to write to the seven churches (Rev. i. 11). On the corresponding seven seats will be the bishops of the seven churches. In a circle above all will be the four-and-twenty elders, four of whom are shown on the model.

The circular panels and medallions will contain the visions of the Apocalypse. Of the large panels, the upper one represents the Vision of Christ in Judgment, with the Book of Life open before Him (Rev. xx. 11); the lower, the dead rising from the sea (Rev. xx. 13). In the small panels on the ribs will be visions of woes which fell on the earth. In the panel to the left the sun is darkened (Rev. vi. 12). To the right a burning mountain falls into the sea, which is changed into blood (Rev. viii. 8 and xvi. 3). In the medallion between the large panels is the angel with the censer (Rev. viii. 3). The corresponding seven medallions will contain the seven angels with the trumpets (Rev. viii. 2).

The groups of figures on the ribs illustrate the chorus of praise to the Lamb, which accompanies the fulfilment of the visions in the Apocalypse: "Every creature which is in heaven, and on the earth, and under the earth, and such as are in the sea, and all that are in them, heard I saying, Blessing, and honour, and glory, and power, be unto Him that sitteth upon the throne, and unto the Lamb for ever and ever. And the four beasts said, Amen. And the four-and-twenty elders fell down and worshipped Him that liveth for ever and ever" (Rev. v. 13, 14). The lower groups represent the holy on earth, and illustrate appropriate texts from the Psalms of Praise. Each group is accompanied by an angel or heavenly muse, who inspires them with the spirit of praise. Above are the angels who stood round the throne; alternately with whom will be the martyrs (Rev. vii. 9-12), symbolised by groups of three on each rib, with two youthful angels, on each rib. The whole is crowned by the circle of elders.

The central panel was designed by Sir FREDERICK LEIGHTON, F.R.A., and a reproduction of the original cartoon was published in *The Architect* on January 6.

DESIGN FOR MIDDLESBROUGH PUBLIC BUILDINGS.

WE publish this week the north-west view of Mr. J. R. NICHOLS' premiated design for the Middlesbrough Public Buildings. The corresponding view, with a description, were published last week.

MEMORIAL PULPIT, ST. MARGARET'S, WESTMINSTER.

THE illustration shows the details of the memorial pulpit which has been erected in St. Margaret's Church, Westminster. It was designed by Mr. SIDNEY VACHER, A.R.I.B.A. The stonework has been carried out by Mr. EARP, and the hammered iron handrail by Messrs. BARKENTIN & KRALL. The small wood desk was carved by Mr. ROBINSON, and Messrs. POTTER & SON engraved the inscription plate. The embroidery was done at the School for Art Needlework, and finally, Mr. JAMES BELL carried out the decoration. The architect's design has been departed from in one important respect, inasmuch as the pulpit has been entirely painted. Canon FARRAR has assumed the responsibility of the alteration in the following communication:—

The original design of the pulpit at St. Margaret's Church was in white stone, but as colour was at that time the chief want of the church, I suggested to Mr. Vacher that, following the model of some famous ancient pulpits, he should pick out the design in colour. The suggestion was mine, not his. The colouring of the pulpit seems to me to show a high degree of artistic skill and merit, but at first, and before the colour had toned down, the effect of the brilliancy, and especially of the bronzed gold, was rather too powerful for the general cold tone of the building. The freshness of the colouring has been toned down, and I believe that the pulpit—of which the design is excellent—is now universally admired.

A Stained Glass Window is, by order of the Lord Lieutenant of Ireland, to be erected in St. Saviour's Dominican Church, Dublin, as a memorial of the late Mr. Thomas Henry Burke, the Under-Secretary. Messrs. Clayton & Bell are the artists.

THE ARCHITECTURAL ASSOCIATION.

THE annual "Members' Soirée" of the Association was held at St. Andrew's Hall, Newman Street, on the evening of the 20th inst., when there was a very large attendance, including a few of the old friends of the Society. The entertainment commenced with a selection of musical pieces and recitations, of which we may mention the "Yachting," of Mr. W. P. Appleton, and the "Dr. Marigold" of Mr. Mechelen Rogers, as having been especially well delivered. The tragic opera "Bombastes Furioso" followed, with Mr. H. D. Appleton for the General Bombastes, and Mr. C. Killmister for the Lady Distaffina. Perhaps Mr. Henry Irving might not have applauded it, but the audience did. The concluding performance was a "Lecture on the Architecture of the Nineteenth Century," by Professor Eloc A. Smada, better known as Mr. Cole A. Adams, whose make-up of person and manner, as a solemn and stern representative of architectural posterity several centuries hence, were most admirable. The "lecture" was highly amusing and especially good-natured, and was received by the assembly—the Architectural Association of the same remote future, which by that time had "absorbed" the Institute—with characteristic enjoyment of the fun. The Queen Anne style of art, the griffin at Temple Bar, and the proposed railway ventilators on the Thames Embankment, with the relation of chimneys to domestic comfort, out-of-door discomfort, and architectural art, were amongst the chief points of discussion. A brief but loyal allusion to the Palace of Justice and its architect was especially well received. The lecture was illustrated by a number of drawings, including a clever rendering of "St. Simon Skylightes," by Mr. Pite, and a piquant red brick façade in the "Normanshaw" style. The evening passed off admirably well.

EDINBURGH ARCHITECTURAL ASSOCIATION.

ON Saturday afternoon the members of the Edinburgh Architectural Association continued their series of excursions to places of architectural interest around the city by visiting successively Pinkie House, Fallside Castle, Elphinstone Tower, and Carberry Tower, which places were kindly thrown open to them for the occasion. Starting in waggonettes from Waterloo Place shortly after one o'clock, the members first drove to Pinkie House, where Mr. Alexander Hope, a younger brother of the late baronet, awaited them, and afterwards rendered them all the assistance in his power towards the full enjoyment of their visit. Previously, however, to their viewing the exterior and interior details of the structure, Mr. Hippolyte Blanc read some notes which he had prepared regarding it. The specimen of architecture confronting them was obviously, he said, one of many dates. Doubtless originating in the Scottish square tower or keep, the oldest part of the edifice now visible was recorded as having been begun in 1613; and, built by Alexander Seton, Earl of Dunfermline and Chancellor of Scotland, it expressed very creditably the cultivation and the learning of the Seton family, to which Scotland owed many architectural ornaments. The primary mansion consisted of the most northern part of the edifice, and, like most of our Scottish baronial work, it rose with severe simplicity from the ground, the artistic play of form being reserved for the upper portions. The interior was the most interesting part of the building, which contained a number of very curious, quaint apartments, accessible only at angles of the staircases. One of these apartments, measuring about 20 feet square, was designated "the king's room," and was said to have given accommodation to Prince Charles after the battle of Prestonpans. Its ceiling was specially interesting, being richly treated in plaster, with panelling in geometric design, beautifully decorated pendants giving marked relief. The panels of this roof and of that of a smaller apartment adjoining were filled with monograms of Lord Seton, crests of the Seton family, fleur-de-lis, &c. But perhaps the most interesting apartment in the house was the painted gallery, 120 feet long, and very narrow in proportion. The roof, which was slightly elliptical in form, and composed of wood boarding, was entirely covered with most interesting paintings and inscriptions, executed in compartments, and representing a mixture of mythology, heraldry, and romance. In concluding his remarks, Mr. Blanc said that although Pinkie House was a large structure, it might be assumed that it was never completed. It appeared to have been intended to enclose a quadrangle, of which the elaborate fountain in front of the existing house should form the centre. The members then had an opportunity of examining the various objects of interest in the interior, and the architectural features of the exterior. Having cordially thanked Mr. Hope for his courtesy and kindness, the members, after visiting the chapel on the confines of the grounds, drove on to Fallside Castle, the history of which read from its architecture, was shortly discussed. Proceeding next to Elphinstone Tower, Mr. Blanc, continuing his notes, pointed out to his fellow-members the interest which the tower possessed, as affording an opportunity of studying the earliest form of the Scottish feudal castle. Elphinstone Tower was usually assigned to the fourteenth century. Oblong in form, it measured about 60 feet on its longest side, and was between 70 and 80 feet high—its walls,

near the ground, being about 12 feet thick. Mr. Blanc, after calling attention to the row of armorial shields which finds a place in one of the walls of the principal apartment on the first floor, concluded with a reference to the removal in 1865 of the old buildings which formerly adjoined the tower. Getting under weigh again, the members drove to Carberry Tower, to the exterior features of which Mr. Blanc directed the attention of the members. Carberry Tower, he said, was one of those peel towers of which they had already seen examples that day. Its walls were much thinner than those of Elphinstone Tower, being only about 6 feet thick, and the whole structure was much smaller. On these grounds he was disposed to think that Carberry had never been intended as a place of defence. The upper portion seemed to have been of more recent construction than the lower, as the grotesque character of the gargoyles served to show. The company were then shown over the house, and had an opportunity of inspecting the numerous fine pictures and other interesting objects of art which it contains. This inspection completed, the journey home was forthwith undertaken, and the company reached Edinburgh shortly after eight o'clock, having spent a most pleasurable afternoon.

THE ROMAN FINE ART EXHIBITION.

THREE months ago, says a correspondent of the *Times*, the Fine Art Exhibition in the Via Nazionale was opened with all possible pomp and ceremony by their Majesties King Humbert and Queen Margherita, but the bright anticipations of which the inauguration of the grand new Palazzo delle belle Arti seemed to be the beginning of fulfilment have been sadly disappointed. Leaving on one side for the present the question of the merits of the works to be seen in it, the exhibition is a lamentable failure from every point of view. It is very seldom that a day's receipts at the doors exceed 750 frs., or 30*l*. On a few occasions double that number of persons—the entrance is a franc each—have visited the exhibition in one day, but on very many more the number has fallen to 500 and below. Go in when you may the spacious halls have a deserted look, the police and custodians seem to outnumber the visitors, and the buyers have been very few indeed. The papers—certainly without any intention of being sarcastic—have cried out that efforts should be made to render the exhibition attractive. Concerts have been organised in the great hall and the municipal band plays there occasionally of an afternoon, and on those days a greater number of persons enter. It was originally intended that this first exhibition in the new palace should be an international one. It was so announced. Circulars of invitation were addressed to all the Foreign Fine Art Academies for distribution. These circulars were printed in the language of the countries they were sent to. It was anticipated, and with good reason, that the best artists in Europe would vie with each other in doing honour to Rome on such an occasion, and that a wealth of modern art would be brought together, the like of which had never been seen before. It was a grand opportunity that can never occur again, and those artists whose limited and protectionist ideas were the cause of its being lost are now, when it is too late, aware of the mistake they have made.

It was not long after the invitations to the academies of Europe were sent out that the existence of a feeling antagonistic to the admission of works by foreign artists became manifest. It divided the artistic body more or less into two parties, but those I may call the protectionists prevailed. They argued that if the great English, French, German, Spanish, and other painters sent some of their best works to Rome, modern Italian art would be compelled to take the second place in its own country, and Italian artists would suffer in pocket. Had it been possible, they would have withdrawn the invitations issued, but as that was out of the question, they contented themselves with not giving any further encouragement. No facilities such as that when the English Government sent a man-of-war for the Italian works of art in 1862 and sent them back in the same way were offered. The foreign artists were left to send their works entirely at their own risk and expense. No doubt many would have borne this willingly, but when they became aware that their room rather than their company was desired, and that among the risks to be incurred was that of rejection, they drew back from rendering homage to this university city of art when they were not in return to be honoured guests. That foreign artists of talent had to face the risk of having their works rejected, or, still worse, sacrificed in the hanging, may seem an exaggeration, but it is the simple fact. Sir Frederick Leighton has contributed one work—a portrait head of the well-known painter, Costa. It is skied at the very top on a side wall in a side room. Alma Tadema sent three pictures, and one was hung above the line. The expressions of surprise on the opening day were such that this error was remedied. Rollin Tilton sent one work—his fine landscape of the *Plain of Thebes*—which attracted crowds to his studio when he first let it be seen, and it was rejected. Arthur Strutt, whose landscapes are highly esteemed, sent three, and they were all rejected. Of three sent by Henry Cook, two were accepted, but they have been hung where it is impossible to see what they are, one on each side of a window opening to the floor, with the light from a corresponding window glaring on them from the

other side. This peculiar arrangement of light was made for the benefit of a large ceiling picture, placed nearly horizontally above. An admirably-painted portrait of Thomas Adolphus Trollope by Mrs. Taylor, Miss Westcott's inimitable fruit-pieces, and Mrs. Carson's delicately-painted flowers are all skied beyond any possibility of being seen, and so on with regard to others, among which I may mention two vigorously-painted portrait-heads by a Greek painter, Cleonice Gennadios. The hanging committee was composed of delegates named to represent the Roman, Milanese, Palermitan, Florentine, Venetian, Bolognese, Neapolitan, and Turinese painters and sculptors, but there was no one on it to represent the foreign artists.

The exhibition, therefore, is one of national and not international art. I refrained from writing this three months ago from unwillingness to do anything that might prejudice the success of the exhibition, but now that is no longer possible, and it may be permitted to express sincere regret at the results of the narrow, short-sighted line adopted. Why the exhibition, containing as it does so many fine works, should be so great a failure, even to the extent that adventitious aid has to be called in, is easily explained. Joris, Jacovacci, Laccetti, Vannutelli, Tiratelli, and others, though painters of deserved fame in Italy, are unknown elsewhere. Their names carry no meaning, offer no attraction, to the thousands of foreigners visiting Rome, whose attention is occupied by St. Peter's, the Vatican, the Capitol, the Forum, the well-known picture galleries, the ruins, the churches—in short, by the numberless places and things of known interest they must see, and they have neither time nor inclination left to visit a gallery of modern Italian paintings and statues by men they never heard of before. As regards the Italians, there is nothing special in the exhibition to arouse a general interest—nothing to make the place a fashion or a rendezvous. The majority pay their francs, some perhaps return a second time, and but few go oftener. They have seen the exhibition and are satisfied. But had the intention of the original promoters prevailed, and had this first exhibition been international as they desired, its success would in all probability have been as colossal as its failure has been miserable. The Italians would have crowded to it to see the foreign works, and especially those by painters of known reputation; their interest would have been aroused by comparing the works of their own artists with those of other countries. English, American, and French visitors to Rome would have been curious to see how works by Leighton, Millais, Orchardson, Vicat Cole, or Keeley Halswelle, or by Bonnat, Detaille, J. P. Laurens, Bouguereau, or De Neuville, looked alongside those by painters of the same race from which sprang Raphael, Michael Angelo, Correggio, and a host of others. And I am inclined to think that in many cases the result would not have been so unfavourable to the Italian artists as the pessimists, or rather the short-sighted protectionists, among them argued. At any rate, their works would have been seen. Their names would have become known to the English and American visitors, who are the largest buyers. Many works would have been sold which must now go back to their authors' studios. Competition would have created a vitality absolutely wanting, and the success of the exhibitions of national art to follow in Rome would have been assured, for the exhibition of modern works of painting and sculpture would have been entered among the things visitors to Rome ought to see.

The idea that the foreign artists would have carried off commissions from the Italians is too absurd to need refutation. The prices they habitually obtain are alone sufficiently prohibitory. But even if a few had sold pictures or received commissions, the success the presence of their pictures would have secured to the exhibition would at least have tripled the sales the Italian artists have made.

THE SHAKESPEARE MEMORIAL ASSOCIATION.

THE eighth annual meeting of this association was held on Tuesday in the library of the Memorial Buildings, Stratford-on-Avon. The chairman of the association (Mr. Charles E. Flower) presided, and moved the adoption of the report, which stated that it had been arranged to build the central tower in the course of the summer, and a contract had been entered into with Messrs. Lascelles & Co. for the purpose. This will complete the buildings, exclusive of the ornamental detail and statuary, which are not essential to the design. With regard to the performances, the report stated that every care had been taken to make them as complete as possible, and it was anticipated that they would be fully equal to those of previous years. None but first-class companies would be permitted to perform in the theatre. The picture gallery had been kept open with a good collection of valuable pictures lent by friends, to whom the warmest thanks of the Council were due. The chairman, in moving the adoption of the report, said the badness of the times had induced the Council to postpone the making of an appeal for further subscriptions to complete the buildings. As it was desirable the central tower should be erected, he (the chairman) had determined to put 2,000*l*. into the funds, so as not to raise a formidable debt, and he hoped when times improved the amount would be refunded. Al

who had witnessed the present series of performances were agreed that the plays had never been put upon the stage in a better or more complete manner in the provinces, and never in London unless a long run was contemplated. With regard to the exhibition of paintings in the gallery, the chairman said many gentlemen had kindly lent valuable pictures of Shakespearean interest, which served to replace those taken away, and infused new interest into the collection. He was pleased to say that a valuable present of books had been received by the Memorial Library from Mr. Henry Willett, of Brighton. The books consisted of the first edited edition of Shakespeare's plays, by Rowe, published in 1709. This edition followed the famous folios, and Rowe was the first who divided the plays into scenes, describing the scenes, and furnishing illustrations of the costumes in a beautiful set of steel-plate engravings. The Council were particularly anxious to get Rowe's edition of Shakespeare for the library, and their thanks were due to Mr. Willett for his valuable present. Mr. J. J. Nason seconded the adoption of the report, and spoke in support of the objects of the Memorial Association, which he trusted to see fully realised at no distant date. The promoters were determined to proceed with the work, and to carry it to a successful issue, the latest undertaking being the completion of the buildings by the erection of the tower. The report was adopted. Alderman Cox announced, with regard to the purchase of the Bancroft—a large piece of land adjacent to the Memorial Buildings—that the Great Western Railway Company had sanctioned the transfer, and the agreement would receive the company's seal at the next meeting. It was intended to convert the site into public gardens and recreation grounds, in connection with the gardens belonging to the Memorial Association.

THE GLASGOW INSTITUTE OF ARCHITECTS.

A SPECIAL general meeting of the Glasgow Institute was held on the 18th inst. Mr. James Thomson, the president, occupied the chair. The chairman stated that this meeting had been called for the purpose of receiving and considering the report of the Council of the Institute with reference to the proposed new Police Bill. Mr. John Honeyman, convener of the Committee of Council appointed with reference to the matter, stated the views of the Council on the subject, and submitted the following letter which the Council recommend should be addressed to the Lord-Advocate on the subject:—

81 Bath Street (corner of Hope Street),
Glasgow, April 18, 1883.

John Blair Balfour, Esq., Q.C., M.P., Lord-Advocate,
14 Great Stuart Street, Edinburgh.

My Lord,—I am desired by the Glasgow Institute of Architects to bring under your notice their views on the expediency of eliminating all building regulations from the proposed General Police Act, and the representations which they have already made to the Town Council of Glasgow on this subject.

For several years this matter has occupied the attention of the Institute (which, I may explain, is an incorporated body composed exclusively of practising architects); and while the proposed Glasgow Police Bill was under discussion the Institute was frequently in communication with the Town Council, and endeavoured to convince that body of the inadequacy of their most recent proposals as to building regulations, and the expediency of keeping Police and Building Acts entirely distinct. Their representations were ineffectual; but they are not without hope that your Lordship—and other representatives of Scotland in Parliament—may recognise the importance of such a separation and the urgent need which exists for a new and comprehensive Act dealing exclusively with building regulations, and reforming the present most unsatisfactory mode of administering such laws.

There are three arguments in favour of the course recommended by the Institute which I am desired most respectfully to press upon your Lordship's attention.

1st. A proper code of building regulations must embrace much more than the regulations embodied in the Glasgow Police Bill, and would encumber any Police Act with irrelevant matters which could be much more conveniently and thoroughly dealt with separately. They could also—a most important point—be dealt with more deliberately. Owing to difficulties besetting the subject and the special knowledge required, it is of importance that the provisions of a Building Act should be adjusted mainly by experts; but it is most undesirable that such experts, or a majority of them, should be municipal officials.

2nd. It is desirable that the machinery for enforcing building regulations should be entirely remodelled and assimilated to that which has for many years worked satisfactorily in London under the Metropolitan Building Act.

3rd. In this event it would be necessary to divide the country into districts quite irrespective of the limits of police jurisdiction, and the present arrangement of Dean of Guild Courts, with separate jurisdiction in every burgh, and in the case of Glasgow and some other places in every different suburb, would become unnecessary and, indeed, unworkable, with this important result, among others, that the office of inspector or surveyor of buildings would be filled by a few thoroughly qualified and well-paid men, instead of, as at present, by a multitude of inferior men, who in most instances have received no professional training and who possess no special fitness for the duty. Under the Metropolitan Building Act no one can be appointed a district surveyor unless he has obtained a certificate of competency from the Royal Institute of British Architects;

and my clients are strongly of opinion that any general Building Act should contain that or some similar provision. They submit that the object of any such Act must be twofold—to define with precision everything which a proprietor of land, or a person proposing to build, must do in the interest of the general community; and to provide the most effectual means of ensuring the fulfilment of such common obligations without exposing the parties affected to any avoidable trouble or expense. In this connection the importance of leaving as little as possible to the discretion of administrators, and of placing authority in the hands of thoroughly qualified officers only, can hardly be over-estimated.

I have the honour to enclose copy resolutions and recommendation which the Institute presented to the Town Council, and, in conclusion, I venture to express the hope that these representations, which are only offered with a sincere desire to further the excellent object which your Lordship has in view, may receive your favourable consideration.

In name and by the authority of the Institute,
(Signed) WILLIAM MACLEAN, Secretary.

The following were the resolutions unanimously passed at an extraordinary general meeting of the Institute held on November 4, 1882, to consider the new Police Bill for Glasgow:—

1st. That it is expedient that the clauses relating to buildings and the jurisdiction of the Dean of Guild be omitted from the Police Bill.

2nd. That the laws relating to buildings should be consolidated and amended by a new Act dealing with that special subject, similar generally to the Metropolitan Building Act, and applicable to the suburbs as well as to the City of Glasgow.

3rd. That inasmuch as it is impossible for the Town Council, or the ratepayers either, to consider the advantages of the course now proposed by the Institute, or the merits of the draft Bill now published, before the day on which Bills for next session must be lodged, therefore the Institute protests against the Town Council giving notice of their intention to proceed with the Bill at this time.

4th. That a copy of the foregoing resolutions be forwarded to the Town Council.

The following recommendation was passed at a meeting of the Council of the Institute held on January 18, 1883:—

The Glasgow Institute of Architects recommend that all clauses of the draft Police Bill relating to (1) the jurisdiction of, and procedure before, the Dean of Guild; (2) the Master of Works, his powers and duties; (3) the formation of new streets; and (4) the erection of and alteration of buildings should be omitted from the Bill, and that such clauses, amended and amplified, should form the subject of a separate Act. The resolution of the Town Council to delay proceeding with the Bill in the ensuing session of Parliament makes it possible for them not merely to consider deliberately the advisability of the course recommended by the Institute, but also to draft such a measure as has been above indicated; and in view of the greatest importance that this work should be undertaken by the Town Council, so that their advice on this, as well as on matters of police, may be brought before his Lordship. Without expressing any opinion on the advantages or otherwise of a Police Act being made general, we would venture to say that the advantages of making a Building Act general are manifest and undeniable, and we are most anxious that the present favourable opportunity of obtaining for Scotland a suitable measure of the kind should not be lost.—In name of the committee,

(Signed) WILLIAM MACLEAN, Secretary.

On the motion of Mr. H. K. Bromhead, seconded by Mr. Alex. Skirving, the above proposed communication to the Lord-Advocate was unanimously approved of, and the secretary was instructed to forward the same.

THE AMERICAN TARIFF ON WORKS OF ART.

THE artists of the United States are of one mind with their countrymen who have studios in France, in opposition to the Bill which has lately passed through Congress, increasing the duty on the importation of works of art into the United States from 10 per cent. to 30 per cent. *ad valorem*. As early as November 1882, the Society of American Artists inaugurated a movement in favour of the entire abolition of the tariff upon works of art by unanimously passing the following resolution: "Resolved, that the attention of the present Tariff Commission and of Congress should be called to the fact that whereas the United States of America is the only leading nation in the world that has not inherited the works of art of any great epoch of the past, it is at the same time the only nation that puts a penalty, by means of a tariff, upon the importation of works of art, both ancient and modern, and that in the opinion of this society all works of art should be excepted from the payment of duties, both in the interest of art in general, and of American art in particular." A special committee was also appointed to act for the society in this matter. One of the results of this movement was the introduction, on January 29, 1883, by the Hon. Perry Belmont, of New York, of the following Bill in the House of Representatives: "A Bill in Relation to the Importation of Works of Art.—Section 1. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that no duties shall be levied or collected on any works of art, either ancient or modern, or on any objects of classical antiquity imported into the United States, but the same shall be wholly exempt from

duty; and the term 'works of art' as here used shall be understood to include all paintings, drawings, photographs, lithographs, etchings, and engravings of every kind, and all statuary, of whatever material, such as marble, stone, wood, ivory, metal, or plaster; also all plaster casts of objects of artistic or archaeological value; and the term 'objects of classical antiquity,' as here used, shall be understood to include all objects of art or manufacture produced before the beginning of the nineteenth century. Section 2. That Section 1 of this Act shall not be understood as exempting from payment of duty modern jewellery or any objects of trade manufacture attached or to be attached to clocks, gas fixtures, or to other objects of household furniture; neither shall the same be understood as exempting from payment of duty statuary imported for the sake of the material of which the same is composed. Section 3. That all provisions of law inconsistent herewith are hereby repealed." Petitions in favour of this Bill were signed by a large proportion of the artists of America, by directors of many museums and galleries of art, by connoisseurs, and by influential citizens of the entire country. Notwithstanding the fact that those most interested in art made this earnest protest against any duty whatsoever upon the importation of works of art into the United States, the duty was increased as above stated. The Society of American Artists wish to make it known that this action of Congress in no way represented the will of the American artists at large, and they expect that this action will be revised and the mistake rectified in the next session of Congress.

THE ORDNANCE SURVEY.

THE report of the progress of the Ordnance Survey to Dec. 31, 1882, has been issued in the form of a Parliamentary Blue Book. It is divided into seventeen sections, and gives a detailed account of the proceedings in connection with the Survey, which are further shown on a series of shaded index maps. The following statement by the Director-General is prefixed to the report: "This report is in many respects much fuller than any which has been submitted in previous years, and the following are the reasons which have led me to think it desirable that such should be the case. In the first place, the year 1882 marks a very definite stage in the operations of the Ordnance Survey, inasmuch as the survey of Scotland has been brought to a conclusion, the last man having left Scotland in November last. The publication of some of the one-inch maps is still incomplete, but this branch of the work is carried on at Southampton. The survey of the whole of Great Britain and Ireland, as originally contemplated, may therefore be said to be completed, the work now in progress being the re-survey on the 25-inch scale of that portion of England to the south of Yorkshire and Lancashire, which had previously only been published on the 1-inch scale, and the revision of the 6-inch map of Ireland. In the second place, a strong wish has been expressed, both in the debates which took place when the last annual estimates for the Ordnance Survey were introduced, and on other occasions, by members of Parliament, that some detailed information should be given as to the steps which have been taken for completing the operations of the Survey and their results, and also as to the processes adopted in the production of the maps, and this seemed the most favourable opportunity for furnishing such information. It will be seen by Section II. that the operations of the Survey will be certainly completed in 1890, and probably somewhat earlier."

FOREIGN SYSTEMS OF ART TEACHING.

THE following letter has been addressed by Mr. J. Slagg, one of the Royal Commissioners, to the master of the Manchester Technical Art School:—

The active inquiries which have been made of late years in Continental countries, especially in France and in Belgium, on the subject of art instruction, seem to have resulted in a general condemnation of the old system of teaching from printed copies on account of the absence of a theoretic and scientific basis in that method. Both in France and in Belgium, but especially in the latter country, the following main principles have been accepted and put into practice for primary art education in elementary and artisans' school, viz., the necessity of founding the first studies in drawing on the elementary notions of geometry; to place the students from the beginning before the geometric models which constitute the alphabet of "form." That linear drawing should be based on geometry. According to the old system—and that, indeed, in practice in our own country to a large degree at the present time—art training rests too little on observation and reasoning. The study consists chiefly of mechanical copying of another copy, and, as linear drawing based on geometrical principles of projections and of perspective (which are the foundations of drawing), are quite absent, there is really no theoretical teaching. Pupils who have studied, even ten years perhaps, cannot render correctly the simplest object seen in space; because between the copy of a picture and drawing from relief there is an abyss which cannot be passed save by theoretical knowledge, which is not imparted to the pupil. But it is not only in relation to the higher grades of art

teaching that the above-mentioned defect has an important bearing. The elementary school scholar, or the artisan attending a night class in a technical school, has not always the time, or inclination, to pursue his art studies into the higher grades of drawing from the solid figure or ornament. He may only be able to attend the first stages of the instruction, and it is of little value to him only to be capable of producing a smudgy, shaky, and inaccurate "free-hand" representation of some florid and often meaningless lithograph. However little he knows, that little should be sound, it should be useful so far as it may go, it should be a safe basis for further work. Thus the first steps in linear drawing should be based on elementary geometrical principles. If an artisan can draw a simple plan with common instruments, such knowledge will be of practical use to him; still more so if he can without instruments sketch out in freehand a plan of fairly accurate geometrical proportions. So much for the first steps. Then, geometrical analysis being the only method of arriving at the exact appreciation of the figure, it follows that the principles of geometry are the only basis of linear drawing. Without these conditions of teaching the pupil does not understand his work, nor is he in possession of any method by the aid of which he can arrive at the exactitude of a drawing made at sight. During the whole of the course of his primary studies the pupil should be exercised in drawing from memory. The course recommended constitutes, in fact, the complete programme of elementary teaching in its true practical aspect—viz., geometrical drawing, as far as projections, drawing at sight, or artistically from ornamentation, leading up to the more important parts of the subject figure. This system comprises much that is required to popularise art teaching. It will establish on a common basis the first education of taste, applicable equally to the man of the world, the artist, and the workman. Elementary art teaching should be of the same nature, whatever be the professions for which the pupils are destined, for such elementary education does not aspire to create artists. Its aim should be to conduct the pupil to the dividing point of the two roads—one leading to creative art, the other to its industrial or trade application. For those workmen whose trades have an artistic relation it will be an immense advantage to understand artistic drawing, and to be accustomed through the study of geometrical drawing from the commencement, to the analysis of objects. This would form a practical basis for artistic handicraft. The exercise of memory has been much neglected in art teaching, and this is a want which might be supplied, especially in relation to all the industries connected with ornamentation. As the students will belong chiefly to the working classes, the teaching must include the elements of applied art. Geometrical training is useful in ornamentation through the direct combination of simple lines, and also in general design, from the appreciation which it gives to the laws of geometry and proportion; again, when the designer desires to utilise in his work the never-ending variety of forms of vegetable and animal life.

Broadly speaking, then, the course of instruction I should recommend would be as follows: (1) An exact mathematical instruction in lines and plane figures, accompanied by exercises in geometrical drawing with instruments, in copybooks. Drawing these figures at sight with freehand on the board. This will inculcate habits of exact drawing. Later, the principles of projection and the elements of perspective, which will teach the pupils to estimate objects in space, and to express solid forms by simple lines. (2) The application of geometrical figures to ornamentation and intersection—thus inculcating the sense of regularity, symmetry and proportion. (3) The general laws which relate to primary colours, leading up to the value and harmony of colours, and the application of drawing to industry. (4) The general principles of relief, through the study of the effects of light and shade on solid bodies. Finally, the complete representation of objects seen in space.

I have not in the foregoing remarks dwelt on the very important question of modelling, but I am thoroughly convinced of the paramount importance of this branch of art study in relation to industrial art training, and, at all cost, a modelling-class should be included in the course of instruction. I am firmly convinced that the future industrial struggle for supremacy will be on artistic ground, and those nations who do not endeavour to elevate their trades by the application of artistic teaching will fall behind in the race. I send herewith a rough outline of studies adapted from the course in use at the most modern and successful Belgian schools; also some sheets showing a method in which artistic teaching is brought to bear on various industrial arts by the system adopted in the Government School of Decorative Art at Brussels. Though the latter scheme is too large and complex to be of practical application in an ordinary technical school course, it may afford you some useful suggestions. The main principle which the Belgian art authorities seem to have specially adopted and applied in their public instruction is that up to a certain point of mechanical and technical knowledge the art-training shall be alike for all; beyond that point the student's efforts are specially directed in those channels which best subserve his individual profession, or industry. In short, as one of their professors observed to me, "We do not condemn the boys who are destined to be mechanics to draw nothing but Venuses' heads."

PUBLIC BUILDINGS, MIDDLESBROUGH.

A SPECIAL meeting of the Middlesbrough Town Council was held last week to consider the question of the desirability of proceeding with the combined new town hall and municipal buildings, or the same separately. Several members of the Council argued that the town could not bear the simultaneous expenditure of the two; and it was stated that the cost would be at least 100,000*l.*, which would add sixpence in the pound to the rates. It was urged that a town's meeting should consider the question. The water-board scheme in hand would come on the ratepayers to the extent of 9*d.* in the pound, or 1*s.* 3*d.* in the pound in all, which the ratepayers should not be asked to bear. The progress of local trade was not to be calculated on. The opening of a new steel works like the North-Eastern Works meant the "fall" of an iron-works, though of course the coming salt trade would aid their cause.

It was, on a division, ruled that the two buildings be gone on with simultaneously. It was further agreed that they be faced with ashlar stone; and the motion "that the lowest tender received for each contract be accepted if the person tendering is acceptable; or, in the event of such not being the case, that the next lowest tender be accepted," was also carried, in opposition to a proposal that the whole of the work should be intrusted to one satisfactory contractor.

ARCHÆOLOGY.

St. Teath's Cross.—The ancient cross which formerly stood near the parish church of St. Teath, near Camelford, in Cornwall, and is believed to be a relic of Celtic Christianity in that locality, has been recently discovered, principally by the efforts of the Rev. T. Worthington while temporarily in charge of the parish. The cross is of the Greek type, and, including the shaft, measures 15 feet high, capped with a nearly circular head containing the projecting limbs of the cross. The greater part of the shaft, 8½ feet long, was found split lengthways, and adapted as a coping for a wall at the west entrance of the churchyard, a position which it has held for forty years. Other parts were discovered sunk in the ground to carry the pivoting of the churchyard gates. Fortunately, the greater number of the fragments have been recovered, and Mr. Worthington has undertaken the reparation and re-erection of this relic. It is to be hoped, however, that admirers of Early Christian art in England will not leave him to bear the necessary cost of the work without some assistance.

The Society of Antiquaries.—On Monday (St. George's Day) the Society of Antiquaries of London met at their apartments in Burlington House, in pursuance of their Statutes and Charter of Incorporation, to elect a president, council, and officers of the Society for the year ensuing. The result of the elections was as follows. President: the Right Hon. the Earl of Carnarvon. Vice-Presidents: Augustus Wollaston Franks, M.A., F.R.S.; William Copeland Borlase, M.A., M.P.; John Evans, LL.D., D.C.L., F.R.S. Treasurer: Charles Spencer Perceval, LL.D. Directors: Henry Salusbury Milman, M.A., Frederic William Burton, the Hon. Harold Arthur Dillon, Charles Edward Keyser, M.A., Edmund Oldfield, M.A., William Smith, LL.D., D.C.L. Council: Doyne Courtenay Bell, Edward Augustus Bond, LL.D., Wilfred Joseph Cripps, M.A., Charles Drury Edward Fortnum, Granville William Gresham Leveson Gower, M.A., Everard Green, Sir John Lubbock, Bart., M.P., F.R.S., Rev. William Dunn Macray, M.A., John Henry Middleton, M.A., John Edward Price. Secretary: C. Knight Watson, M.A.

Discovery of a Roman Villa at Chiddingfold.—Mr. Ralph Nevill announces the discovery of the site of a Roman villa near Chiddingfold, in Surrey. The site is in a field called High Ridings, on the property of Mr. Thomas Sadler, and about half a mile from his house of Pockford. It had long been noticed that the soil over it was of a different character to that of other parts of the field, and on digging a trench extensive foundations of rough sandstone were discovered. Most of these have, unfortunately, been removed to mend roads, but the position of the walls is clearly shown, and is now being permanently marked out. No pavements or wrought work have yet been found, but only a small portion of what the crowbar shows to exist has been uncovered. A considerable amount of Samian and other broken pottery has been found, and some of the usual large Roman roof tiles. A small silvered bronze head of late Roman date and one coin of doubtful period have also been found. There is an old disused green road running by the site, and although the field is at the top of a hill, water rises freely on digging. The site is extremely interesting as being on the clay in the north of the Weald of Sussex, and below the range of sandhills stretching from the Hindhead to Leith Hill—a position in which, it is supposed, no Roman habitation has hitherto been found. Mr. Nevill thinks it will be found that there were many more roads between the south coast and Surrey than those at present traced, and that the opinions of Dr. Guest, adopted lately by Mr. Green, as to the impenetrability of the Andred's Weald, must be largely modified. From indications there was a considerable Roman settlement on this side the hills,

perhaps as great as in the valley from Farnham into Kent, and numerous roads from the southern ports intersected one another and were joined by cross roads.

SANITARY WORKS.

Sanitary Control of the Metropolis.—The following letter has been forwarded to the Home Secretary by the National Health Society, signed by the Duke of Westminster, president of the society: "To the Secretary of State for the Home Department.—Sir,—I am desired to express the satisfaction of the National Health Society at the announcement that Her Majesty's Government have determined to bring forward a measure for the improved local government of the metropolis, and they do so in the confident expectation that it will make provision for the removal of those conditions of disunity in the present local administration which have long proved so detrimental to measures for the improvement of the health of the population. I am to transmit herewith, for your consideration, copies of the representations that, with general public support, the association have heretofore submitted to your predecessor on the principles of the amendments, needed especially in respect to the conditions of the water supply of the metropolis; and I may now add as to its drainage, which may be thus summarised. That measures should be taken for the prevention of the stagnant detention of water in cisterns, by which good supplies are made bad, and bad supplies are made worse; that supplies from improved sources should be carried direct and constantly into every house, and the fouled water constantly removed by self-cleansing drains or channels from every house, and from the town by works under one and the same authority, and that authority a public and responsible one. That the success of any administrative measure for the sanitary improvement of the metropolis will be dependent on the competence, in science and skill, of the executive officers employed; and that it is requisite that adequate securities should be provided to insure such competence in all new appointments. That it is the confident belief of those conversant with sanitation that the cost of efficient measures for the reduction of existing excessive death-rates will, under efficient administration, be less than the present incurable burdens arising from excessive sickness and mortality. I am to state further that sanitary authorities are agreed that the annual money burdens of excessive sickness and excessive numbers of funerals from premature mortality in the metropolis exceed what would be the annual charge of efficient preventive works, which can only be obtained by a properly constituted public authority under a complete unity of administration. I have the honour to be, Sir, your obedient servant, WESTMINSTER.—April 13, 1883." A meeting to promote the objects of the society has been fixed for May 9, five p.m., at Grosvenor House, by permission of the Duke of Westminster, who will preside.

LEGAL.

Lancashire Assizes.—April 24.

(Before Mr. Justice CAVE.)

HOWARD & VINCENT *v.* ACTON.

RESPONSIBILITY OF VALUERS.

The plaintiffs in this case, according to counsel's statement, were trustees of certain funds advanced on mortgage of house property, and they alleged that the defendants, Messrs. Thomas Acton & Sons, had been guilty of gross negligence in the valuation of the property, the result of which was that the plaintiffs, acting on that valuation, advanced money on property which had turned out to be perfectly valueless. The property was certain cottage property, partly finished and partly not finished, facing Brass Street and Vauxhall Street, Collyhurst. The application to the plaintiffs to advance the money was made in January 1882, and it was made on the part of two persons named Grundy and Kelly, who seemed to have been speculating, and they took the plot of land and built upon it certain houses which it would be a compliment to describe as jerry built. They applied to the plaintiffs to advance them the money upon mortgage. The plaintiffs' solicitors, Messrs. Needham & Co., required that there should be a valuation in the ordinary course by some man of respectability and standing. The defendants were engaged to make this valuation, on the strength of which the money was advanced. And counsel said if he was not mistaken, it would be shown that the case furnished as gross an instance of negligence as had ever been brought before the court. The plaintiffs had lost the whole, or nearly the whole, of the money (900*l.*) which they advanced on the faith of the valuation made by the defendants. They, therefore, claimed 800*l.* as damages. For the defence it was affirmed that the plaintiffs never requested the defendants to make a valuation of the property mentioned in the statement of claim, nor did the defendants accept any retainer or employment in that behalf; that the defendants valued the property solely for Grundy & Kelly, and did so carefully and skilfully, and put a fair value on the property;

that the plaintiffs did not act on the defendant's valuation, but on their own judgment; that of the 900*l.*, 560*l.* was advanced on the security of a chief rent of 28*l.* issuing out of the premises, and that that part of the security was still worth 560*l.* at least; that the foundations of the houses were injured by heavy storms of rain; that the plaintiffs, who had ample means of preserving the bulk of the premises, allowed them to go to ruin; and that the plaintiffs had not suffered any of the damages claimed by them. The evidence of the surveyor of the city of Manchester and other witnesses was to the effect that the foundation of the houses was not a good one, and that both in respect of material and workmanship the houses were of the "very poorest type that could possibly be erected." Several of the cottages, it appeared, gradually tumbled down within six months of their erection, and the remainder of them had to be demolished. The testimony of the witnesses for the defence was that the houses were fairly built for houses of their class, and that the defects in them and their consequent tumbling down and demolition was due to the state of the foundation of the retaining wall, with the condition of which the defendants could not be supposed to acquaint themselves in making an inspection of the buildings for the purpose of their valuation. It was further affirmed that the land, independent of the buildings, was worth 500*l.*

The jury found for the plaintiffs; damages, 250*l.*

Smoke Abatement.

SIR,—With reference to your notice on the 21st inst. of the constitution of the council and managing committees of the National Smoke Abatement Institution, I would ask a few lines to state—as will be seen from the 28th Article—that the council is as yet far from complete as regards numbers.

There is every wish that the managing bodies should be as widely representative as possible, and when arrangements have been completed it will be found that the provinces have had every facility offered for co-operating in the work of abatement of smoke, one which there is every desire should be national, not only in name, but in fact.

I am, Sir, your obedient servant,

WM. R. E. COLES, Hon. Sec.

National Smoke Abatement Institution,
44 Berners Street, Oxford Street, W.
April 23, 1883.

CHURCH BUILDING AND RESTORATION.

Wallsend.—The corner-stones of a Methodist chapel have been laid. Accommodation will be provided for 200 persons. Mr. J. J. Lish, Newcastle-on-Tyne, is the architect, and Mr. Thomas Fortune, North Sunderland, is the contractor.

Wheatley.—A Wesleyan chapel and Sunday-school has been opened. The building has been erected from the designs of Mr. J. Farrar, Halifax. The contractors were: Mason, Messrs. Michael Firth & Sons, Queensbury; joiner, Mr. Joseph Halliday, Halifax; plumber and hot-water engineer, Mr. J. B. Walsh, Halifax; slater and plasterer, Mr. Joshua Taylor, Ovenden; painter, Mr. Thomas Carr.

Bagshot.—The foundation-stone has been laid of the new church of St. Anne. The church is being built from designs supplied by Mr. H. A. Cheers, architect, of London and Bagshot; and the builder is Mr. Joseph Higgs, of Dorset Square, London. The style of the church is Early English, and accommodation will be provided for 450 persons.

Preston, Lancashire.—A new Wesleyan chapel has lately been opened at Ashton, near Preston. The plan consists of nave and two shallow transepts. In the rear there are vestry and classroom. The walls are of brickwork, with Longridge stone for the entrance porch, and triplet window in east gable. Terra-cotta is also used in spandrels and string moulds. The internal joiner's work is of pitch pine, varnished, and the ceiling is of pitch pine match-boarded, relieved by stencilled ornamentation. Comfortable accommodation is provided for 250 sitters. Local contractors have carried out the works from the designs and under the supervision of Mr. David Grant, architect, Preston.

Pitlochry.—An Established church is about to be erected at Pitlochry from designs by Messrs. C. & L. Ower, architects, Dundee. It will accommodate about 500 sitters, but provision has been made for the enlargement of the church to seat 600 or 800 persons. The seats are arranged somewhat in the form of an ellipse round a large platform. Behind the platform is a low altar rail, and the class-room at the back is shut off by movable screens. The principal doorways are on the sides of the church. It is

intended to heat the church by means of hot water. Two large ventilators in the ceiling take off the hot air, which will be carried up the tower by means of boxes, and thrown out at the highest possible level. The church is to be built in the Norman-Gothic style. It is expected to be finished and ready for occupation early in 1884.

GENERAL.

Sir Frederick Leighton, P.R.A., has accepted the honorary membership of the Glasgow Art Club, to which he was recently elected.

Mr. J. L. Pearson, R.A., has been appointed architect for the restoration of the exterior of Westminster Hall consequent upon the removal of the Law Courts.

A Design by Mr. F. E. F. Bailey, of Walsall, has been adopted for the public buildings at Bloxwich.

M. Georges, of Lyons, has obtained the prize of 3,000 francs from the Académie des Beaux-Arts, for an essay on the history and characteristics of the styles of architecture.

The Parkes Museum of Hygiene will be opened in the new premises, 74A Margaret Street, Regent Street, W., by H.R.H. the Duke of Albany on May 26.

A Donation of 13,000*l.* has been sent by the Rev. J. Morgan towards the cost of the erection of the American Episcopal Church in the Avenue de l'Alma, Paris.

Messrs. Kinnear & Peddie have prepared plans for a new bank in Dunfermline.

The Exhibition of Italian Art in Glasgow will close on Monday next.

Mr. C. J. Innocent has obtained first place in the limited competition for the new Sunday Schools, South Street, Sheffield, his design having been selected. There were sixteen competitors.

The Parish Church of Leeds is to be altered; the estimate has been prepared by Mr. C. R. Chorley, in which the cost of the works is said to be 3,500*l.* Mr. Pearson, R.A., is consulting architect.

Mr. Thomas Agnew, a member of the firm of Messrs. Agnew & Sons, of Manchester, London, and Liverpool, died on Saturday morning, at his residence near Manchester, in his 56th year.

Mr. Henry Doyle, C.B., has secured for the National Gallery in Dublin two views of Dresden, by Bernardo Bellotto, the nephew and assistant of Canaletto, which attracted a good deal of attention at the Narischkine sale in Paris for their brilliant execution and singularly perfect condition. They were sold for 9,000 francs. A landscape by Gainsborough in his early manner, of very high quality, has also been bought for the Gallery at a sale at Messrs. Christie & Manson's.

A Collection of Roman Coins has been found in the grounds of Cobham Hall, near Rochester. The coins, which number between 800 and 900, mostly bear the date of the fourth century, or about 100 years before the Romans left Britain, and are chiefly of the reigns of the Emperors Constantine, Constans, and Constantius. It is worthy of note that many of the coins bear the *labarum*, which was the first emblem of Christianity adopted by the Emperors. The spot where the coins were discovered was near to the old Roman Watling Street, which ran through Cobham Road towards London and the interior of the island.

The Hammersmith Bridge Bill was on Tuesday declared proved by the Select Committee of the House of Commons. The Metropolitan Board of Works will be authorised by it to carry out such alterations in the existing bridge across the Thames at Hammersmith as will practically amount to its reconstruction. During the time of rebuilding it was originally intended to close the bridge for two years, but, owing to the opposition of the inhabitants, the Bill now empowers the Board to construct a wooden bridge across the river for the use of traffic during the time necessary for the completion of the proposed works.

The Works at the Forth Bridge will soon be commenced, as the preliminary preparations are progressing very rapidly, and affording employment to about 1,000 men on both sides of the river. At South Queensferry the buildings which stood in the way are being demolished, and preparations made for the foundation work. The railway line between South Queensferry and Dalmeny has been doubled, to afford greater facilities for conveyance of materials. The necessary buildings for workshops and forges are nearly completed, as well as the erections for taking levels.

The Buda-Pesth Houses of Parliament Competition.—The committee have awarded the prizes for the best plans. There were twenty plans presented. Four equal prizes were given, and the author of the plan which may be eventually selected from these four as the design for the building will receive a further remuneration of 5,000 florins. The successful designs are all by architects of Buda-Pesth, and two, the right to use which has been bought by the committee, are by Vienna architects. The plan which has met with the most general approbation, both as to the internal arrangements and outward form, is in the late Gothic style.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, APRIL 28, 1883.

COMPETITIONS OPEN.

CORBRIDGE.—Plans are invited for the Erection of Chapel and Schools. Mr. John Bennett, Queen Street, Burslem.

ELGIN.—May 31.—Plans and Designs are wanted for Town Hall proposed to be erected. Mr. David Forsyth, Town Clerk, Elgin.

LEAMINGTON.—Designs are invited for Board Schools for 1,200 Children in Shrubland Street, and Schools for 1,200 Children in Leicester Street. Mr. C. J. Blaker, Clerk to the School Board, 5 Church Street, Leamington.

MOLD.—May 8.—Plans and Specifications are required for adapting Upper Rooms of Market Hall as Assembly Rooms. Mr. G. E. Trevor Roper, Clerk to the Local Board, Mold.

NEWCASTLE-ON-TYNE.—July 4.—Designs are invited for a Police Station and Fire Brigade Station to be Erected on the site of Westgate Police Station. Mr. Hill Motum, Town Clerk, Town Hall, Newcastle-on-Tyne.

ROSCOMMON.—May 9.—Plans and Designs are required for the Restoration and Improvement of the County Courthouse. Mr. T. Glancy, Courthouse, Roscommon.

WOLSTANTON.—May 1.—Plans are invited for Board Schools, to accommodate 600 Children, at Goldenhill. Mr. Henry Farmer, School Board Offices, Tunstall.

YEovil.—July 1.—Designs are invited for Swimming Baths, &c. The Borough Surveyor, Yeovil.

CONTRACTS OPEN.

AYR.—April 30.—For Building Station Buildings and Hotel. Plans, &c., at the Engineer's Office, St. Enoch's Station, Glasgow.

BANBURY.—May 2.—For Erection of Farm Buildings, and other Works. Mr. John C. Eggar, Architect, 36 Bridge Street, Banbury.

BANGOR.—May 7.—For Construction of Gasholder Tank. Mr. F. Pollock, Town Clerk, Bangor.

BARTON STACKY.—For Works at Manor Farm. Messrs. Westbury & Son, Andover.

BATLEY.—April 30.—For new Rooms and Stables at Commercial Inn. Mr. J. T. Law, Architect, 64 Commercial Street, Batley.

BELFAST.—April 30.—For Rebuilding part of Bank Premises. Mr. W. H. Lynn, Architect, 21 Calendar Street, Belfast.

BIDEFORD.—May 5.—For Erection of Market Buildings. Mr. John Chudleigh, Architect, Newton Abbot.

BINGLEY.—April 28.—For new Presbytery. Mr. E. Simpson, Architect, Tyrral Street, Bradford.

BIRKENHEAD.—May 9.—For Boundary Walling and Ornamental Railings, &c. Mr. T. C. Thorburn, Borough Surveyor, Birkenhead.

BOBBINGTON.—May 3.—For Building House and Offices. Mr. T. Nicholson, Architect, Hereford.

BRISTOL.—For Building a Hall. Mr. J. Foster, Architect, 17 Burlington Road, Clifton.

BROMSGROVE.—May 2.—For Boiler and Exhauster House, &c., at Gasworks. Mr. T. Newbigging, C.E., 5 Norfolk Street, Manchester.

BURTON-ON-TRENT.—May 9.—For Building Pumping-Station Buildings near Sewage Tanks, and Supply and Delivery of Cast-iron Pipes. Mr. James Mansergh, 3 Westminster Chambers, Victoria Street, S.W.

BURY.—For Building Store and Four Dwelling-houses. Mr. A. Hopkinson, Architect, 27 Market Street, Bury.

CARDIFF.—May 2.—For Building Church. Mr. John Pritchard, Diocesan Architect, Llandaff.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK.

Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

THE INTENDED COMPETITION FOR THE WAR OFFICE AND ADMIRALTY.

THE First Commissioner of Works having intimated in general terms the intention of the Government to institute a competition of architectural designs for the great building which is to be erected near Charing Cross to accommodate the War Office and the Admiralty, we may take it for granted that the arrangements on foot will

be regarded by the profession of architects throughout the country, not only with the great interest due to so great a contest, but with an interest altogether special and exceptional, arising out of the peculiar condition of the competition question at the moment, and, we may add, a somewhat critical state of the profession itself. In the remarks which we have to offer upon the subject we are, therefore, particularly anxious to be guided by those considerations which ought to govern all that is done in an important public enterprise at an important moment.

The critical state of the profession is this: Every year, for a long time, has been throwing into the field of architectural art in England generally, and of course in London, more especially, a much larger number than might be supposed of designers of the very highest class. Speaking academically, every one of these is competent—reserving only the point of age—to do all that is necessary to produce a most excellent work of art on a large scale. It is needless to observe that, at the same time, the demand for such advanced work is not equal to the supply. In fact the demand is small, and, so far as Government buildings go, it always will be small. We may even say, perhaps, that it is smaller than it used to be, on account of certain misunderstandings that have arisen between the representative men of the art and the representative men of public authority; and, what is worse, it is to be feared that the sentiments of our statesmen with regard to architectural display at the expense of the national purse are still advancing in an opposite direction to the views which are entertained by architects, not only on their own behalf professionally, but almost more on account of the liberal example set by other nations, and so far lost upon England. In a word, the feeling of leading politicians seems to be that magnificence in building may be left to those of the commonalty who choose to indulge in what is no doubt a commendable luxury, but that “the money of the taxpayers,” however freely spent upon the business that is transacted inside the Government offices, should not be lavished upon that grandeur of their appearance which is, or ought to be—or may be supposed to be—we scarcely know how to finish the sentence.

In these circumstances, what with the growing ambition of our designers and the paucity of opportunity for its exercise, the announcement of a national building on the grandest scale being in contemplation must necessarily influence the professional imagination and desire as they have never been before. There are literally hundreds of competent and able men all over the country who must already find themselves longing for the delight of the expected competition. To add to the excitement, there has just been established, with what appears to be universal assent, an important change in the principle of such contests. For the future the competitors are to expect their merits to be adjudicated upon by experts in the art, and not by proprietors only and amateurs. Fair play amongst themselves is to be the paramount consideration; and then the profit is to follow the lead of the fair play. Competition for the competitors is to be in one way or another the end of it all; and if it is not to be expected but that the disappointed will still be the dissatisfied, their dissatisfaction is no longer to be entitled to be expressed and discussed as in former times, far less to be received with the respect which is claimed to be due to the protest of an indignant majority.

Mr. SHAW-LEFEVRE is supposed to be at present engaged

in considering and weighing the comparative conveniences, and doubtless inconveniences, of two customary modes of competition. There is the recent precedent of the Law Courts, on the one hand, which affords an illustration of the system of limited competition; and on the other hand there are such instances as the Houses of Parliament and many other competitions since, conducted more or less satisfactorily on the open or unlimited plan. The one mode proceeds by first selecting a certain number of competitors, all of acknowledged skill, to whom the contest is then confined, with an understanding that the author of the most approved project shall be employed to carry it into execution; the other invites all who please to do so to submit their designs on an equal footing, obviously without any understanding beyond the engagement to pay certain sums of money as premiums for so many of the best. But there is a third mode which in effect is a new one, and which we may suppose to be also under consideration. Here there is a preliminary invitation to all the world to send in sketches only, or designs on a small scale of drawing and without elaboration of development; from these “sketches” a certain number of the best are selected (by expert adjudicators), and the authors of these become the competitors in a limited contest of fully completed “designs,” the author of the best of these being entitled, conditionally, to be the architect of the edifice. Perhaps we ought to say there is a fourth mode which may possibly be urged upon the attention of the Minister, and one which, so far as we know, is entirely a novelty, and indeed a purely theoretical and speculative proposal. We read in a contemporary the suggestion of a correspondent that there should be two competitions, applying separately to the two elements known and distinguished as the *plan* and the *artistic design*. The best possible interior arrangement is first to be arrived at without any regard at all to graceful effect; and then, upon this plan as an accepted and practical basis, a second and separate artistic competition is to take place, and the best design of effect chosen for execution. The proposer of this singular but theoretically sensible scheme (to some extent carried out, by the way, in the late contest at Glasgow) would have the prize of employment divided between the two authors of the best practical plan and best artistic effect respectively, each of whom would take charge of his own part of the work. To these four varieties of competition there is, we believe, no fifth to add; but there are three other ways of obtaining an architect. One is the old-fashioned way, namely, the appointment of a standing Government architect, as Sir ROBERT SMIRKE, for instance, was appointed to build the British Museum, and the Houses of Parliament also until the cry for competition caused him to be set aside. Sir JAMES PENNETHORNE was the last official of this kind, the Museum of Geology and the London University being his latest works. Another way would be to select from amongst the leading practitioners of the day someone who could command the confidence of everybody; a thing, in a word, not just now to be done. The last course of procedure to be mentioned, and one that has of late years been actually tried, as in the case of the Post Office at St. Martin's-le-Grand, and in the recent alterations of the Houses of Parliament, is the introduction of the ordinary Civil Service staff of architects belonging to Her Majesty's Office of Works, who are of course very capable men for their ordinary business, but may be supposed to be by no means anxious to step forward into the dangerous field of ambitious artistic enterprise. If our political administrators were to take the decision into their own hands, without reference to any other considerations than those which govern Treasury affairs as strict matter of business, this last course is probably the one that would be adopted with perfect confidence. The arrangement of a plan for the accommodation of the officials of the War Office and the Admiralty would very likely be done better by the experienced officials of the Office of Works than by any outsider whatever; and the composition of the architectural effect is a thing which the Cabinet itself, and even the House of Commons, might possibly not flinch from pronouncing to be scarcely worthy of the consideration of a practical people. Nay more, it is not to be forgotten that only a very short time has elapsed since the whole architectural profession were not a little scared by the rumour that these very feelings were to be acted upon with regard to the very enterprise now under discussion. Happily, however, better counsels seem to have prevailed; the outside world of art is once more to have the direction of a great national building, and the question is what steps shall

be taken in order to give the best effect to the undoubted desire of English architects as a body to do credit to the occasion.

Without wishing to go further at present than the professional press ought, we may be permitted to suggest that the almost universal opinion of practical architects and the architectural public would be all in favour of an unlimited competition of one kind or another as the first step. Perhaps it may be best to receive in this way nothing beyond the so-called "sketches" in the simplest form possible. Whether second editions of these in full development are really requisite or not is a serious question; perhaps it might be possible to turn the second competition in the direction of improving rather than developing the results of the first. But the chief difficulty, after all, is not the obtainment of a good design, but the realisation of the hopes of those young and inexperienced competitors—who often produce the best designs—when they expect, as they now will, to see the execution of the work entrusted to the winner, *coûte que coûte*.

THE GROSVENOR GALLERY.

THE Grosvenor Gallery proves this season more than ever a ground whereon the conflict of the styles is fought out. Mediævalism, naturalism, realism, idealism, and all the rest of the "isms," appear in pronounced development. Between Mr. WATTS and Mr. BURNE JONES on the one hand, and Mr. HERKOMER and Mr. JOHN COLLIER on the other, the various phases and vagaries of modern art find play, and from the hands of sufficiently competent exponents produce an assemblage of pictures that makes this summer exhibition, if not one of the best, yet certainly one of the most interesting that has been held in the gallery.

It may be a moot point whether, for the training of either the public taste or the artist's professional *morale*, the display of studio sketches and studies such as are admitted to the Grosvenor be advantageous or no. But there is no doubt that an exhibition gains interest of a special kind when it contains such things as, for example, the studies by Mr. WATTS, R.A., of the *Four Riders* (101 to 106), designs pregnant with fervid imagination that seems to struggle for expression through imperfectly responsive artistic means. The head of the *Hon. Mary Baring*, again, is merely an unfinished portrait study, at a stage of the work which is always instructive to students to note. Mr. WATTS also exhibits his sombre but noble *Knight*, familiar to visitors at Little Holland House, and a picture of a young girl lounging listlessly in an arm-chair at a window, weary of the *Rain that Raineth every Day*. The focus of the exhibition is, however, the finished design by Mr. BURNE JONES, called *The Wheel of Fortune*, to which the hangers have rightly given the central position on the long wall of the west gallery. The Fortune here is no flattering impersonation of caprice, but a grand woman of colossal proportions, swathed in iron-grey draperies, who turns the wheel of destiny with soft but resistless hand, and seems to regard with pity rather than disdain the figures of her unconscious slaves, as the fatal rotation brings each forward on the inevitable circuit. The care with which all artistic means of expression are by the painter used for the one end of the symbolic thought is very noteworthy. The colour is merely brown and grey, with flesh tints hardly removed from monochrome. The design is kept strong and emphatic: the helpless forms of king, poet, and beggar, admirably modelled nudes, detach from the great curve of the wheel on which they are bound, and yet fall into its significant lines, balanced as these are into compact composition by the upright figure of the Fortune. Exception has been taken to the absence of rebellion in the forms bound upon the wheel; there is no struggle against fate expressed in their aspect. But herein lies, to our thinking, part of the completeness of thought in this pictured "emblem." The aspirants of Fortune's favours rise hopefully, all unconscious of the irony that shall turn their progress downward at the moment of climax and success; and the face of Fortune meets their upward gaze with her unfathomable smile, the sorrow of which they apprehend not. A contemporary critic complains that the picture "is not cheerful company." Where would be the painter's fulfilment of purpose if the picture were joyous in appeal? Mr. BURNE JONES exhibits another composition of the *Hours*, as women in radiant apparel engaged in handiwork, seated six in a row—a pleasing design, glorious in

colour. Further, there is a portrait of a child (*Philip Comyns Carr*), a pathetic-faced boy, painted in woful colouring, all unlike the sweet tints of healthy childhood but yet irresistibly attractive. Of the same school of artistic interpretation is Miss PICKERING, who has, however, most affinity with Mr. SPENSER STANHOPE. Her large and elaborate illustration of the old Jewish plaint, "*By the waters of Babylon we sat down and wept*," does not fail for want of care. It is assiduously studied. Many of the figures—notably that of the girl cast prone upon the ground in agony of lamentation—are remarkable for thoroughly-understood form and depth of expression. But the mannerism which this earnest young artist has assimilated and made her own pervades this picture to its hurt. The lanky and languid forms, the drooping, melancholy heads and long extremities, when assembled in such numbers, produce a painful monotony and depression, not to be redeemed by the skilful management of colour in juxtaposition of isolated hues, which, if sombre, are rich and varied. Curiously enough, the most ambitious venture of another lady artist, Mrs. CARR HASTINGS, has fallen upon the same subject (156). In colour, a play upon golden apricot and silver, the picture is, as Mrs. HASTINGS' work always is, deliciously and decoratively right; but the study of the figure, though good in rhythmic line, is not up to the mark. Mr. MATTHEW HALE seemed at one time to essay a hybrid style which had affinities with the aims of the BURNE JONES group, but his showy and certainly clever picture of *Psyche before Venus*, with the somewhat crude nudity of the golden-maned goddess on her white marble throne, shows an attraction towards the more realistic pseudo-classicism of which M. WEGUELIN is the exponent, while the form of the cowering PSYCHE in the foreground has a mediæval pinch in its meagre attenuations. Mr. SPENSER STANHOPE himself sends a picture from the same myth, *Charon and Psyche*, not, however, a good example of his power. If we comment on the tragic expression and strange artificial colouring of Mr. DAVID CARR'S "queen's friend" *At the Door of La Force*, 1792, and mention two *nocturnes*—in *Blue and Silver* and in *Black and Gold*—by Mr. WHISTLER, the last, a very clever "impression" of fireworks on a moonless night in a garden crowded with spectators, we have finished with the more eccentric and exceptional kind of work with which the Grosvenor Gallery is identified.

Portraiture takes a chief place amongst the art which remains for notice, by far the largest section of the exhibition. Once again we are glad to welcome Mr. W. B. RICHMOND in the essentially distinguished style which at his best belongs to his work in this branch. Of his numerous contributions *Mrs. Mirless*, a bright-faced elderly lady in a bonnet, is perhaps the finest in *technique* and vivid embodiment of character; *Lady Mary Glyn*, in white satin against a gold coloured screen, the most elegant; and *Miss Nettie Davies*, a young girl in brown velvet lying in ungainly length on the shadowed grass, the least satisfactory in every respect. Mr. RICHMOND has this year a certain mode of painting his flesh surfaces with a light, dry brush, and forcing up the draperies by luscious impasto, which produces a brilliant effect. Flesh-painting is not the strong point of that strong artist, Mr. ALMA TADEMA, R.A.; but it must be allowed that the portrait of *His Excellency Count von Bylandt* shows some capital modelling and texture of vitality. *The Duchess of Cleveland* is extraordinarily emphatic, but about the most stern specimen of the treatment of age that we ever saw: not a softening or reverent touch is there, and the introduction of the abundant jewellery and bared throat (the artist's choice, we understand) accentuates the pictorial irony. Mr. MILLAIS, R.A., had a handsome subject in the present *Duchess of Westminster*, whose brilliant complexion and chestnut hair he makes yet more telling by robing the lady in black lace and silk, splendidly painted. But the arms are very coarse. The other portrait-picture, *Master Freeman*, is wholly unworthy the painter's fame. *For the Squire*, a tiny rustic maiden in orthodox cotton sun bonnet and frock, is rather full of sputter in the brush work, but delicious for character. The mingled awe and fearlessness in the blue eyes and solemn, dimpled little face, are given as only MILLAIS can give such a trait of childhood in our day. Mr. HERKOMER paints many portraits, not one of which we can honestly profess to admire, however pronounced in character and boldly painted. *Mrs. Stanford* is a libel on a lovely and refined type, all the more provoking from being in a certain way a likeness. *Herr Joachim* portrays the celebrated violinist with all the music taken out of head and hands, and the fiddle he clasps left like the sign-board of an

empty hostelry. It is an ungrateful task to set forth that Mr. HERKOMER seems more and more bent upon presenting the mere fleshly husk of the men and women who pose before his portrait-easel, and to eliminate from his characterisations all the finer touches of interpretive idealism which raise portraiture from an exhibition of clever handling or prosaic imitative skill into noble and thoughtful art. There is always a danger that a painter's own cleverness will prove his source of failure, a thought incident to consideration of other besides Mr. HERKOMER's work—Mr. HOLL's, for instance. We are still on the line of emphatic actual realism in portraiture when we look at Mr. JOHN COLLIER's *Three Sisters*, and at Mrs. COLLIER's excessively vivid and clever half-length, life-scale portrait of the *Artist at Work*. No two artists could work more in the same spirit than this painter-pair. Mr. COLLIER's *Pharaoh's Handmaidens* may be ethnologically correct; we will not pronounce; and the warm, dusky flesh of their busts and limbs is well modelled, but the picture as a whole cannot be considered either agreeable or refined. Refinement, in fact, is markedly absent from most of the figure work in the Grosvenor, with certain exceptions which we have already noted. It is not this quality which gives pleasantness to Mr. P. R. MORRIS's picturesque scene on the French coast, where fisher-girls, who have been attending their *First Communion* in unaccustomed finery of white muslins and shoes and stockings, tramp barefooted home along the wet sands, with draperies prudently held high and *chaussure* in hand. On the other side, it is a certain delicacy of feeling and style which gives charm to the work of Mr. HERBERT SCHMALZ, whose chief picture, a half-length figure of a girl waiting in a latticed chamber of some mountain castle for one who lingers yet—*How Long?* the title asks—is marked by much poetic consistency and thoroughly artistic handling.

To save space we must name together, regardless of incongruous juxtaposition, the following; Mr. HOLIDAY's *Dante and Beatrice*, in which the figure of the poet denied his lady's salutation is the best thing in the picture; by Mrs. JOPLING, a bright portraiture of *Ellen Terry* as *PORTIA* in the trial scene; a clever semi-decorative piece, in pale creamy tones, the head and bust of a dark-eyed Druidess carrying a green heap of *The Sacred Mistletoe*, set against a snowy background by Mr. BOUGHTON, A.R.A.; a delicately humorous bit of Dutch *genre*, wherein the minister acts as *Peace-maker* between a young "vrow" and her square-set partner, by the same artist; Mr. J. R. REID's crisp and characteristic glimpse of fisher-life, an old tar seated on a wall above the village spinning *The Yarn* to a group of children—an admirably sound bit of work; Mr. R. W. MACBETH's *Sheep Shearing* scene in a big rafted barn; a Capri idyll, in his curious blunted colour scale, by Mr. MACLAREN, of a girl playing with *The Pet Goat*; and certain poetic essays in the vein of Mr. WALTER CRANE, called *Art and Love*, and *Endymion* by Mr. E. BENSON. Lastly, we must dismiss regretfully with a word the forcible scenes of Venice life on the lagoons by Mr. W. H. BARTLETT.

Landscape is not the strong feature of the Grosvenor Gallery, and comes for the most part from artists who make their mark in the Academy. Mr. KEELEY HALSWELLE, for example, shows two capital specimens of his favourite rainy weather effects, one of which, *Royal Windsor*, is a striking and stately treatment of the massive pile seen over the shining river levels. Mr. ALFRED PARSONS brings his broad style into greater compactness and more tender truth than heretofore in the flower-filled spaces of a *Green Garden*, and the milky richness of a blossoming thorn set against a park side in all *The Gladness of May*. The relation between the whiteness of the tree and the whiteness of the luminous clouds above is a beautiful touch of subtle truth. From Italy come tasteful bits by Signor COSTA, some curious little literal pictures by TELEMACO SIGNORINI, a pastoral of the Campagna by Mr. CORBETT, Mr. GEORGE HOWARD's mosaic-like treatment of *The Vale of Mentone*, and Venetian studies by the new associate, Mr. E. J. GREGORY. Mr. H. MOORE has contributed a powerful study, *The Tide Race*, of tumultuous sapphire blue sea, and Mr. HOLLOWAY sets *The Old Wellesley* war-ship swinging on the water underneath a sky of silver blue and ragged shower clouds. We cannot close without a word of recognition for the great animal picture by Mr. J. T. NETTLESHIP, *Blind*. It is a pity that a passion for enormous scale, and a certain coarse unartist-like execution, tell against just appreciation of this as of other poems of animal life by this painter; for there is undoubted pathos and grand intent in his work, which

suggests the cartoons of JOHN TENNIEL "writ large." The subject here is a lion, a king of beasts, now old and quite blind, who has been hounded by a pack of wolves to the edge of a precipice, where, pausing, he feels with one paw the footless air ere plunging into the abyss. The subject is significant enough, and the treatment, apart from the technical faults indicated, has the intensity and strength of a poem by ROBERT BROWNING.

Lengthy as our notice of the gallery has run, we leave a large amount of interesting work, and all the water-colours, untouched. The sculpture may find review with that at the Academy. It implies no small compliment to the quality of the exhibition that we have found it singularly difficult to deal with it in anything like equal justice, for several reasons. There is a remarkable paucity of poor work, while there is little of supreme quality or style; the scale runs on a medium average, which has sent the numbers of admissions up; and the subjects and modes of treatment are so diverse as to preclude the possibility of selecting a few typical examples for comment which may cover the many. It is certainly, on the whole, an encouraging fact that a second open exhibition should, concurrently with the Academy, bring forward so much that is excellent, fresh, and vigorous. But the encouragement is somewhat marred by another consideration—namely, that so many painters now are given welcome at the Grosvenor Gallery who have ample and sure exhibition ground at Burlington House. This point came up for discussion some years ago, when the late D. G. ROSSETTI expressed his judgment against the desirability of offering in a new institution fresh opportunity to Royal Academicians for occupying space to the exclusion of men outside the pale. We shall not inflict the controversy again upon our readers, but may permit ourselves the closing remark that the Grosvenor Gallery will continue best to justify its existence by opening its doors to the worthiest and strongest art that has not found recognition within the Academy, and more especially by bringing forward more of the pictorial design applied to decorative uses, of which this exhibition shows lamentably little sign.

THE PARIS SALON.

THE remark of a French critic on the Salon of 1883 is that the contributions of foreign artists are remarkable, and, he added, *nous n'avons qu'à bien nous tenir*. On entering the square Salon No. XII., we turn to the right, and are attracted by the delicacy of colouring and luminous tone of FREDERICK UHDE's *Joueur d'Orgue*. The scene is laid in a Dutch village. The announcement that an organ-player has arrived induces some eight or ten young girls to rush out of their school into the paved street, along one side of which the village houses are built. One house on the right recedes, and is wainscotted in black wood; thus the figure of a young girl in pale red is well thrown out. She knits tranquilly while her elder sister peels potatoes, which are cast into a yellow pipkin on a low wooden table in the foreground. The pale pinks, blues, and greys of the girls' frocks, the delicacy of their flesh tints, recall work of the early Italian masters. We are still in the country when we glance at the picture of M. VAN LEEMPUTTEN, who shows us an autumn morning before the sun has dispersed the soft haze which casts a veil of lovely grey-blue over the downs on which sheep have spent the night. Their shadows are projected on the short grass, which they have in some places nibbled away, thus revealing patches of yellow, loamy earth. A few inches above this is a clever little work by M. G. DE VUILLEFROY, *Relancé*, which may be translated, harriers breaking cover. An old hound has hit on the scent; one behind him cannot make it; four or five rush on prepared to follow the leader. They have come through a copse and have only got the scent in an open in the glade. Behind the harriers is the dense wood, from which the pack have emerged; through a break in the foliage a lovely bit of sky appears. Crossing the Salle XII., we are opposite M. A. N. MOROT's *Crucifixion*. It will be remembered that he carried off the Prix du Salon two seasons ago by his *Samaritan*. M. MOROT has treated the subject in a novel and startling manner. The torso of the SAVIOUR is finely rendered; the head reposes on the "tau" cross with an expression more suggestive of sleep than of death; the right arm is bound by cords over the wood of the cross. The colouring of the flesh is that of a man in robust health. The

position of the legs is displeasing, yet the figure is anatomically perfect, and powerfully rendered. At the foot of the cross is the inscription, "Rex Judæorum."

From the square Salle, turning to the right, we come to M. YON's *Rafale*. A storm is gathering from the north; already the wind sweeps across the shrubby downs which encircle the bay and ruffles the upper surface of the dark green sea, not yet lashed to fury by its force; a couple of ponies put out to graze on what stunted herbage they can find, shiver at its approach. The white one turns its quarters to the wind; its companion, a brown pony with a white tail, faces the storm, its shaggy mane blown over its head by the wind. A more awful bank of storm-clouds than fill the sky could scarcely be depicted. M. BOUGUEREAU, president of the jury, member of the Institute, and master of faultless symmetry and irreproachable draughtsmanship, contributes an *Alma Parens* and *La Nuit*. The former is a classic personage, crowned with flowers, on whose lap and around whose throne cluster, in every variety of attitude, several infants. The nude figures are perfect, the flesh tints admirable in softness. Spite the undoubted merits of the picture, we cross Salle XVIII. to contemplate *La Nuit* by the same master. Partly veiled in black, Night is about to fly as Morn appears. She is very beautiful in modelling, her pose graceful, and her contour faultless. With one arm lifted to her brow, she shades her eyes from the dawning light; with her left hand she grasps her veil behind her head.

Passing M. BOUDIN's *Harbour* (roughly sketched, a line of fishing-smacks, in excellent perspective, on the right, seen in the soft yellow light of departing day on a sea of silver-grey), we reach M. BONNAT's magnificent portrait of the United States Minister, Mr. MORTON. He stands against a background of deep brown, his right hand, firmly closed, resting on his hip; the left leans on the handle of a stick, which, however, by no means supports his well-knit and active frame. The head indicates firm resolve and steadiness of purpose. The thin lips are compressed. The grey hair is sparse, and lies flat on the well-formed head. There is truth, given with searching care in the portrait, which startles by its intense reality if it does not fascinate by its charm.

M. BONNAT also sends a portrait of a lady in purple velvet, relieved by pearls. The lady's features are finely chiselled; looking at her we recall the remark of the *savant* AMPÈRE, the most absent of men, who on seeing Princess BELGIOIOSO for the first time remarked, "How beautiful that woman must have been when she was alive."

The picture contributed by M. BASTIEN LEPAGE has already been described in *The Architect*. Nothing can be more simple than its subject—a low hedge, on which a young washer-girl has stretched a violet handkerchief to dry, separates her parents' garden from that of her neighbour, the village smith, who wishes to ask her to be his wife, but does not in the least know how to put the crucial question, which the girl instinctively guesses, and turns her head shyly away. In the distance are the paternal cottages from which the respective gardens slope. Around the lovers are the neglected flowers, running untrained at their own sweet will over the ground, and in the rear is a field of turnips. The picture is an idyll. We wish there were less violet tone in the foreground; with that reserve this is quite one of M. BASTIEN LEPAGE's most characteristic works. His object has been to render the poetry of rustic life as it exists in a distant province, far removed from city influence, and this sentiment is expressed in *L'Amour du Village*, which he painted in his mother's home at Damvilliers, Lorraine.

On the right on entering Salle XX. is a gem by M. JULES BRETON, who himself kindly explained to us that his lovers were not quarrelling, but, on the contrary, *s'entendaient parfaitement*. A stream, turned to gold by the gleaming sun of early morning, separates the shepherd-boy, who has more pluck than BASTIEN LEPAGE's village smith, and speaks boldly across the water to his love, whose business, it would appear, is to look after some sheep. Unheeding her charge, she leans on her crook, and answers her wooer with more defiance in her pose than might in future years prove conducive to the peace of the *ménage*. We accept M. JULES BRETON's word that an *entente cordiale* exists betwixt the parties. What is indisputable in the scene is its poetic beauty and the glory of the golden light with which it is illuminated, and its indefinable charm.

In the same Salle, conceived in a very different tone, is his *L'Arc-en-ciel*. In this picture M. LE BRETON faces the difficulty of throwing a rainbow across a storm-laden sky.

A peasant woman, her features worn and thin, her figure wrapped in a poor shawl, is returning home on a donkey led by her son, a fine young lad, bare to the knee, who attracts her attention to the "bow set in the cloud." The road they follow, wet and miry, traverses a plain covered by gorse, now red with autumn tints. The whole landscape is in half-light, and the work is attractive in its weird sadness.

M. RICHARD BERGH's *Portrait of M. K.*, whose *incognito* we respect, is remarkably clever. The artist is in his studio, seated crosswise on an oaken settle; his suit of velveteen is innocent of paint-spots; he looks at you with the keen glance of an artist; behind him is a prosaic iron stove, and near him a jar of *grès*, in which he has arranged his brushes ready for work. Truth, power, and life are in this admirable likeness. As beautiful here as when we last saw the portrait at the Mirlitons is M. CABANEL's *Portrait of Madame Henri Couve*. There are depths of poetic sentiment in those large liquid eyes, overshadowed by darkly-pencilled eyebrows; in the mystic smile there is a quasi DA VINCI expression. The flesh-tones of the finely-moulded bust convey the impression of rare delicacy of colour, set off perhaps by the black lace which fringes the low-cut bodice and the Spanish mantilla gracefully falling on the right arm. In M. CABANEL's portrait of *Madame H.* we have an aged lady, whose snow-white hair forms a coronal which adds dignity to her appearance. She is clad in sables, and wears an antique jewel on her neck. The countenance indicates unswerving will, and is evidently that of one accustomed to command.

M. CAZIN's rendering of the story of JUDITH is novel and clever. We have before us a vast extent of country laid waste by the enemy. JUDITH, attended by her handmaid, has quitted the strongly-fortified city, and is about to seek for HOLOFERNES. A group of men on the right, in the immediate foreground, aware of her purpose, watch her with enthusiastic admiration. Some dead bodies lie to the left, among these a living infant in the arms of its dead mother. The story may not be evident to everyone, but there is a charm about the work, and the delicate colouring attracts and fascinates. M. BASTIEN LEPAGE and M. CAZIN belong to the vanguard of the young French school. M. CLAIRIN paints Madame KRAUSS as the genius of tragedy. M. CLAYS, with his accustomed *couleur locale*, gives a Dutch harbour filled by shipping. The sails of the brig at anchor hang lazily, and a small boat is making its way across the still silvery water to the vessel. The shore on the right is marked by windmills, now still in the summer evening. M. CLAYS is a master in his line; his ships are sailor's ships, and defy even a sailor's criticism. M. COR's *Portrait of Ernest T.* is excellent. The child, in a suit of brown velvet, stands with one hand thrust in his leather belt, while the other rests on a stick as tall as himself. The chiselling of the child's features, the light and shadows on the dimpled cheeks, the light of the dark eye, intensified in tone by the long eyelash, show the master's hand. The child stands, feet apart, on a carpet of deep red, a dark curtain in rear of the figure. *Cairo*, as painted by M. THEODORE FRÈRE, from the northern side of the city, was indeed worth the forced cavalry march to save. The turrets and cupolas, in evening light against a sky of ethereal grey, create a lovely outline. Some camels and their attendants rest in the plain without before entering the city. The sun is setting. They seem dark against the luminous atmosphere. Spite of criticism we admire the picture immensely. M. FLAMENG has *le courage de ses opinions*, and although we confess to have seldom seen the extraordinary effect of roseate light he has thrown on the beach at low tide at Saint Vaast la Hogue, we consider it within the range of possibility and very beautiful; especially good are the boat lying on the beach in the foreground and the broken rocks partially covered by sea-weed.

M. GIDE's clean and amusing picture of English and other tourists crowding round the easel of an unfortunate artist engaged in reproducing the *Galerie de Henri III.* in the palace at Fontainebleau, was described when that picture was exhibited at the International Exhibition of last winter. We therefore pass to one of the best works of the Salon, to which, from the extreme sobriety of its tone and the perfect harmony of its colouring, it will be difficult to do justice in a few words. We refer to the *Bureau de Bienfaisance*, by M. GERVEX. We have before us the inner office of a Mont de Piété; light comes from the rear, because of a large window which fills an arched recess. The official who assesses the value of the property submitted to his inspection is separated from us by a

glazed partition, at an open pane of which stands now an ancient gentlewoman, attired in the plain gown, the cashmere shawl, and gathered bonnet of fifty years back. By her side, and nearest to us on the extreme right, is a *gardien*, who controls the transactions of the day. A poor old woman carrying a sick child awaits her turn. In the middle foreground stands an admirable figure of a young girl of fifteen years, on whose golden hair falls strong light from above, who reads the list of articles she carries in a basket; and on the extreme left is the touching figure of a workman's wife and her child. It is evidently their first visit to a Mont de Piété. There is nothing exaggerated or theatrical in the demeanour or appearance of the poor waiting at the *guichet*. The picture is one of everyday Paris life, admirable in composition, tone, and style. M. GERVEX's portrait of the daughter of the Belgian Ambassador proves that his talent is many-sided. Tall and fair, the young *aristocrate* stands in her ball dress waiting for her carriage; the white tulle of her dress and the white satin of her train are separated by a wreath of delicately-tinted flowers. The figure is graceful and the pose natural. M. JUNDT, the veteran master, enchants as in days gone by. He takes us always to the country in fresh fair spring-tide. The gable end of a large farmhouse is flecked by the radiant beams of the rising sun; the young girl of the house has risen betimes, and washes her wooden tub in a stone tank overgrown by roses and mosses and all manner of greenery. The tank is supplied by a stream silvery in the light of the rising sun. The girl watches a cow and its calf lapping the cool clear water. The animals are up to their knees in the tall grasses, meadow sweet, and wild thyme which grow in rank luxuriance around them. The place is picturesque, and may be somewhat damp, for it lies at the foot of a wooded hill. The path beneath the trees, to its summit, is discernible to the right. This is a lovely work, true to nature and nature's poetry, drawn *con amore* by one of her truest exponents.

M. HENNER gives us a young girl fresh from her bath, who has thrown herself on the ground to enjoy in the silence of perfect solitude a black-lettered tome she intently studies. Perhaps the exquisitely-moulded limbs are of an unearthly tone of ivory white, which fault, if it be one, their extraordinary beauty more than redeems. Her face is partly thrown into half light by the magnificent *chevelure dorée* which overshadows it. The lower extremities are partially sunk among the grasses which cover the ground. M. HENNER's *Religieuse* is simply the profile of a young nun, whose beautiful features are rendered in a delicate but more healthy tone than those of *La femme qui lit*. With surprising courage M. HENNER binds the white linen band across her forehead and surrounds her throat with a line of equally dead-white linen, from her head falls a veil of sable darkness. It is a triumph of careful and exquisite work, equally beautiful in *modèle* as in technique.

Sans dot takes us to the country, in the vicinity of Poissy, we fancy, where dwells its author, Mr. DANIEL RIDGWAY KNIGHT. The marriage procession, preceded by the children of the family, crosses, by a raised pathway, a broad meadow; the bride, with her groom, the parents and friends two by two, as is the custom in French country life. In the foreground, having gathered a heavy load of produce in a stained and coarse cloth, stands a young girl, strong and healthy, and by no means devoid of personal attraction. She watches, with tearful eyes, the triumph of her neighbour and class mate, who has carried off the best *parti* in the village, no less a personage than the grocer himself; and she, poor child, *Sans dot*, can she aspire to so great an honour? The country is rendered with the delicacy, fidelity, and true sentiment which ever mark the productions of Mr. KNIGHT's brush.

We close these notes, jotted down on varnishing day, by drawing attention to the *clou* of the whole Salon, a work of extraordinary merit, executed by an artist who has scarcely attained his twenty-second year. M. ROCHEGROSSE has selected a passage of HOMER for the subject of his work, which covers a canvas some 5 mètres in height by 5. At the summit of a flight of steps outside the walls of Troy stands ULYSSES, who orders the execution of the infant Prince Royal ASTYANAX. Greek warriors have snatched the child from his mother's arms. One among them holds the infant, who looks towards its mother, and is about to precipitate it over the wall. The mother struggles with fierce energy in the arms of three warriors, who evidently exert their utmost force to keep her prisoner. Her robe of pale pink, magnificently embroidered, is torn by the convulsive movements of her frame, endowed

for the moment by superhuman strength. The corner-stone of the stairs is covered by blood, for on it the heads of several victims have been decapitated; they lie in a ghastly pile at its base. Some corpses are in the foreground.

The picture, it must be remembered, is the work of a young artist. It is not without faults, but it is one of considerable power, and denotes genius of no ordinary calibre. Very sincerely do we trust that a rumour which has reached us may be verified, and that M. ROCHEGROSSE may carry off the *premier prix du Salon*.

THE BIRMINGHAM BUILDING TRADES EXHIBITION.

FOR the second time an exhibition of this character, which closely follows the lines of those annually held at the Agricultural Hall, has been essayed in the Midland metropolis, this time under the sole management of Mr. SHRAPNEL, who we had recently to compliment on the success he achieved at that held at the Islington hall. In comparing the present display with that held at Birmingham last year, we find the exhibits exceed those of the previous exhibition by about one-fourth, many of them, too, being extensive both as regards size and number of articles shown. Machinery in motion is in much greater force than on the former occasion, the firms of PIGGOTT & Co. and TANGYE BROTHERS standing prominently forward in this industry; and it is only fair to add that there is little in connection with the building trades that does not find a representative here, though the display of indoor appliances largely outnumber those for exterior use. The exhibition was opened in Bingley Hall on Monday last by the Mayor of Birmingham, Mr. WHITE, who in the course of his speech alluded to the fact that their town may claim to be the parent of the modern exhibitions, as it was in that same hall in the year 1849, and consequently two years prior to the great International Exhibition of 1851, that the first exhibition, which, if we remember rightly, was termed "An Exposition of Birmingham Manufactures," was held. But, notwithstanding the fact before mentioned, it is none the less true that the "hardware village" has not taken "kindly," generally speaking, to exhibitions of a miscellaneous character; yet there is scarcely a manufacturing town and district in the kingdom that can lay claim to possessing so many advantages for such purposes did her manufacturers think proper to put forth their strength in those directions, but they appear to prefer patronising exhibitions at a distance than to displaying their goods at home. There may perhaps be good reason in their opinion for this indifference, but if the exhibition recently opened for the second time is continued annually, as we have good reason to believe it will, the increase in the number of exhibits that has taken place over the last year's show will no doubt continue to extend itself, as it has done in London, and Birmingham manufacturers will find it necessary to patronise an exhibition in their midst if only to maintain their own prestige.

There is every probability that the undertaking will prove a success, and in the hands of such an enterprising *entrepreneur* it is not likely to lack good management. It is to remain open for one month, which will give ample time for the denizens in the densely-populated district around the town (and who are naturally fond of sight-seeing) to visit the hall.

Messrs. HODKINSON & CLARKE, "at home," though always attractive wherever seen as regards their exhibits, are in great force. Beyond the pretty structure that has been so much admired at the Agricultural Hall in London, they have a second plain oblong building containing several windows, which enables them to show their new festoon spring blinds of Madras muslin to much greater advantage than we recently saw them at the Agricultural Hall, and should materially assist them in effecting sales. Turning to another branch of their manufactures, a variety of "lifts" are shown that will bear favourable comparison with those of most other makers, and they appear as good adepts in the making of school furniture as in any other of the branches to which they turn their attention. Their new registered school desk and seat, with back, is a veritable improvement on those that have come under our notice. This appliance, which consists of a form and desk, with flat or sloping fixed top on iron standards, as now used in most schools for scholars and as seats for meetings, has in addition an iron upright, pivoted on an axis to the legs of the seat at each end, supporting a back of comfortable form, which for

meetings can be easily reversed, in which case the audience sit with their backs to the desk or table, the latter forming a ready means for taking notes, &c., to the next row behind them.

Mr. GEORGE JENNINGS, of Stangate, Lambeth, occupies a very prominent position, and has a large and varied exhibit. A feature that cannot well be missed by anyone visiting the building is his display of urinals; in fact, it is open to doubt if they have not been made too prominent a portion of the collection. They are shown in various qualities, from the common slate one for street use, to others of a highly ornamental character. The latter have gold ornamental and lipped basins, which tend to prevent down-dripping, and they are made with a back outlet of good size, that will carry off any small pieces of foreign matter that may be thrown into the basin, instead of its lying about, as is often the case with the grating outlet. The urinals are fitted with Mr. JENNINGS' patent syphon-flushing arrangement, which automatically discharges a given quantity of water at periodical times (according to the rate at which the water is allowed to flow into the flushing tank), which has greater cleansing powers than the constant flow of a small stream, and will save water also. The collection of closets comprises all those with which the name of the firm have become associated, and that have been fully described in the columns of *The Architect* on previous occasions. We have the patent earthenware valve closet and trap, with ventilating valve and regulating service valve. The patent improved Bramah valve closet and trap, with waste-preventing arrangement, and the "Trapless" valve closet, the whole—including the portion containing the pull and valve—being made in one entire piece of earthenware. The firm also exhibit in connection with this department an improved stoneware ventilating drain and cesspool trap, for fixing at the point of junction with cesspool or sewer, and it appears well calculated to arrest the escape of any sewer gas into the house drains. Lavatories, also, form an important feature in Mr. JENNINGS' display. These, too, comprise various qualities. We have the simple one on cast-iron standards for school use, and others most sumptuously mounted, both as regards the earthenware and cabinet work. An excellent improvement has recently been introduced by the firm to the "tip-up" basins. This consists in allowing them to be taken out for cleaning instead of (as now) making them a fixture, at least so far as the powers of a household go in removing them. By turning the basin up to a certain angle it can be withdrawn, the sockets and pivots being arranged for this purpose, but it can only be done at the one particular angle, and the ordinary tipping up after use is not likely to disturb the basin from the axis on which it rests. A variety of valves, stand-posts, &c., supplement the exhibit, and there are a collection of slop sinks, which, as our readers know, is an appliance on which Mr. JENNINGS has expended much thought. A complete bath-room suite, with improved anti-percussion valves, is another notable feature, and several other things, such as drawn-lead traps and bends, plumbers' brass work, &c., are added. The firm exhibit, in addition, their new heating and ventilating apparatus, adapted for buildings of all kinds, consisting of a cylindrical stove containing a number of vertical tubes of small diameter. Fresh air is introduced from the outer atmosphere, and passes into the apartment through the tubes mentioned, the heating medium, which may be gas or other fuel according to circumstances, being conveyed to the cylinder where it circulates around the vertical tubes. As a simple and effective appliance combining great heating power, we commend it to the notice of the profession. One of Mr. JENNINGS' newest additions to his already extensive business is shown here as a leading department, and consists of a collection of terra-cotta work, indoor and window dressings, string courses, chimney-pots, vases, &c., as well as stoneware sanitary pipes and the many other items included in the term of sanitary ware. The exhibit also comprises the new appliances connected with electric communications, burglar alarms recently invented and patented by the firm, which were described in *The Architect* a short time since.

A new system of ventilation, adapted to all kinds of buildings from a stable to a mansion, or from a weaving shed to an artist's studio, is shown by Mr. T. HARCOURT THOMPSON, of Victoria Buildings, Deansgate, Manchester, and, we understand, is already being largely adopted by architects around the district we have named, both for domestic and manufacturing buildings. To illustrate his system clearly Mr. THOMPSON shows a section of a two-storey house from

15 to 20 feet high, besides smaller models of large buildings, that take to pieces and show the arrangement from basement to roof, between the floorings, &c. To introduce the reader at once to the means employed we have only to say that Mr. THOMPSON uses a ventilating ridge, which becomes his exhaust, and consequently enables him to dispense with cowls of any kind, thereby reducing cost and obviating all fear of the appliance getting out of order. Mr. THOMPSON argues that every house must have a ridge, and in the same breath he says, then why not a ventilating ridge? This ridge can be supplied at a cost little over that of the ordinary one, and in any design to suit different styles of buildings. It is, of course, necessary to carry tubes or pipes from each apartment to terminate at the ridge, and the inventor maintains that he can apply the ridge and its connections to old houses effectually, though there is no doubt that to carry it out in its entirety it should be built up with the house itself. The admission of fresh air is provided for by means of sliding grids fixed in the walls in the usual manner, the use of these being optional. In the case of manufacturing premises, where much dust is constantly arising from the nature of the processes employed, the grids can be inserted in the floor, thus producing a direct upward draught; and in the case of domestic or even manufacturing rooms, where a uniform temperature is necessary to be maintained, an ornamental ventilator is actuated by a column of mercury or small thermometer with a counterbalance. By a simple arrangement the thermometer can be set to any required degree, and as the temperature of the room rises or falls, so will the valve be opened or closed. Such is Mr. THOMPSON's system, which, divested of all its details, leaves the ventilating ridge as the novel feature in his arrangement. If it can be proved in practice that this ridge will practically effect all that the numerous cowl ventilators attempt to do, then the question of ventilation becomes considerably simplified, and we dispense with a host of ugly protuberances now rising from our house-tops. Mr. THOMPSON has published a well-defined catalogue, with illustrations of the various arrangements of applying his system, and, from the testimony in its favour, we augur well for its future.

Mr. HENRY BASSANT, of Wells Street, Oxford Street, London, makes the best display of parqueterie in the exhibition, but the firms showing this decorative substance are but few. Mr. BASSANT's display is not so large as that we recently saw at the Agricultural Hall; still we have the quality, if it is deficient in quantity. Mr. BASSANT's designs are always good, and he maintains his ability to fix his work to any existing floor without the liability of its curling up, a matter of no small moment in such work. His borders shown here evince great taste in the manipulation of the woods, which comprise oak, walnut, sycamore, and mahogany. Teak is also brought into requisition, and is ingeniously worked up into designs to harmonise with the new style of decoration. Although confining himself here to floorings, it is almost needless to add that dados enter largely into his ordinary output, in which the lighter-coloured wood, sycamore, is more likely to retain its pristine appearance than when used as a flooring board.

The Patent Victoria Stone Company, Stratford, Essex, and Groby Quarries, near Leicester, make an imposing display of their Victoria stone pavement, &c. A broad flight of steps forms the central object, and several vases and other ornamental articles are ranged at the sides, other specimens being tastefully arranged on parts of the stand. Pieces of the stone are exhibited that have been in wear in London, for five and eleven years respectively, which show how hard and tenacious the material is. About sixty miles of this speciality has been laid down in the metropolis by the company for different London vestries. Its capabilities of undergoing the ordeal of the chisel are shown by a specimen that has been so worked, and it would appear to be equally well adapted for that class of work as a natural stone. A bold window head is another of the articles shown, also a mullion and sill, and specimens of coping.

The St. Pancras Iron Work Company, London, content themselves with but a very small exhibit, confining it to a model of a five-stall stable and loose box, fitted up with their patent safety fittings, paving, &c. The model is about 4 feet long by 20 inches wide, and is a fine piece of workmanship; but in justice to the company we must add that, making all allowances for the time and care generally expended upon a model for exhibition, their manufactures of this class of work lose nothing in comparison with their tiny representative in

Bingley Hall. They also exhibit a specimen of their patent wrought-iron sash bar.

Messrs. HAYWARD BROS. & ECKSTEIN, 187 Union Street, Borough, S.E., have also followed the exhibition to Birmingham with their patent semi-prism lights, ventilators, &c. The position they have taken up is by no means the most prominent in the hall; but, for reasons given below, it enables them so to display their goods as to convince all doubters—if any such there be—of the exceptional practical utility of their pavement lights. The stand is situated under the gallery and adjoining the outer wall, and, the sides being closed in, it very much resembles an ordinary basement, and would be comparatively dark; but the introduction of one of their patent semi-prism lights into the pavement outside admits such a flood of light, that one would think could only be produced by the aid of powerful silvered-glass reflectors. It is needless, however, to mention that no such assistance as this is brought into play or required, the secret of this remarkable illumination lying solely in the properties the semi-prism possesses of receiving and throwing forward or directing the daylight to the utmost possible advantage. The firm show them in a great variety of sizes and shapes, not the least useful of their adaptations being the coal plates which, with a few perforations, render them ventilators as well as illuminators. Their chequered glass lights for inside floor work are well worth attention, as they give a firm foothold and have a pleasing appearance, and are being very largely adopted. A staircase, with the treads and risers made up entirely of the lenses, is another of the many purposes for which they are suitable. The usual good assortment of HAYWARD'S Sheringham ventilator (inlet), and BOYLE'S patent mica flap ventilator (outlet), in a variety of fancy patterns, brass and enamelled fronts, together with specimens of the "semi-prism," and other lenses, including the huge blocks of glass for roadway lights, make up this interesting exhibit.

The entries in the art tile department are not so numerous as we should like to have seen, but considering that Messrs. CRAVEN, DUNNILL, & Co., of Ironbridge, Shropshire, have taken a considerable space, it is a sufficient guarantee that quality in this class of decoration is well represented. They have sent a choice assortment of their varied manufactures, which their representative has arranged with considerable taste. The back of the stand is covered with different classes of work divided into sections, each section having written over it in black and gold letters the purposes for which they are specially suitable. The hand-painted tiles are *recherché*; a group depicting a harvest scene is very rich, and beautifully executed, and meets with universal approbation. Then there are sets representing the months of the year, the seasons, animals, and cartoons from nursery rhymes. Another specimen we cannot pass over is one of a pair of panels, as fitted in stove grates, not that it would not, however, be equally appreciated for many other purposes. Though words cannot do it justice, we may mention that the design consists of a passion flower exquisitely wrought in raised gold, with leaves in dead pale blue on an enamelled cobalt ground, not the least salient feature being that it is carried out with such natural grace. Encaustic, geometrical, and enamelled glazed tiles are also shown here in endless variety. A new feature in this section is a mottled or cloudy appearance given to the enamelled tiles, which is attractive. Ceramic mosaics is another important branch of this firm's business, creditable specimens of which are also exhibited.

Messrs. CRAVEN, DUNNILL & Co. had some new designs in wall tiles for this exhibition, the completion of which, however, has been unavoidably delayed; but they will be finished in a day or so, and we hope to describe them in a future number.

Of the exhibits of horticultural buildings Mr. HENRY HOPE undoubtedly has the pre-eminence; in fact he stands unrivalled, no other town, as far as we are aware, excepting the Midland metropolis, where his works are situated, turning out this description of work with so many important features. It is needless for us to point out the specialities of this firm's work, they being too well known and appreciated; but we may mention that the buildings are of metallic construction, iron and copper being only used, which at least gives them a very light and elegant appearance, while nothing can be stronger or more durable. Mr. HOPE has taken a prominent and roomy position, and shows a metallic vinery complete, a bay of a conservatory, as erected for Mr. MARMADUKE FOX, Mirfield,

Yorks, and a variety of different patterns of casements and frames. The latter possess important advantages; they are made of solid rolled iron, are perfectly wind and waterproof, and guaranteed to fit thoroughly. Some are shown of a very strong character, being hung on gun-metal hinges, and fitted with malleable iron regulating stay-bar and fasteners. A specimen or two of boilers and heating apparatus renders the exhibit complete, and a number of photographs of work executed gives the visitor an idea of the extent of this firm's business.

Mr. J. E. ELLISON, Victoria Square, Leeds, contributes a useful collection of ventilating apparatus, comprising his patent conical ventilators, patent conical perforated bricks and air-grates, patent radiator ventilators, and STEVENS'S exhaust ventilators. The "Conical" and "Radiator" ventilators made by Mr. ELLISON have attained to great notoriety, and though their important features have been described on previous occasions in *The Architect*, we think a few words upon their most salient points will not be out of place, on the principle that a good article can scarcely be too highly praised or made too public. The principle of the "Conical" ventilator consists in the pipes or apertures in air-bricks and grates being made with conical-shaped openings, tapering large to the inside, by which means—no matter what force of wind may be outside—no draught is perceptible; and the way this is demonstrated at the stand, by placing the nose of a pair of bellows in the narrow end and pumping air as hard as you please, is a very practical test. The "Radiator" acts somewhat similarly, but is more suitable for fixing at various heights in rooms, halls, &c. It is composed of a flat disc having behind divisions placed diagonally which slide in and out of a box fixed in the wall, the result being that the air is dispersed in all directions, and likewise without any draught being experienced.

The Pennycook Patent Glazing and Engineering Company show their system of dry glazing, the merits of which are superior to anything exhibited in this class, and of the various systems of glazing without putty now in the market it is, we believe, the most perfect. It is equally useful for flat or curved work, and the exhibit consists of a house with span roof, one side of which is flat, the other arched. Amongst the main features, which have already been pointed out in our columns, may be mentioned that the breakage of panes from expansion, contraction, or vibration is reduced to a minimum, the means used for securing the glass being strips of lead which are rolled in with the zinc forming the sash bar. The sash bars themselves are small in section and consequently obstruct the sun's rays but little. They are, nevertheless, very strong, and with the exception of purlins, which may be placed from 5 feet to 9 feet apart, do not require the support of either wood or iron bars, thereby rendering them very economical. Besides horticultural work the "Pennycook" system is equally adapted, in fact is specially suitable, for the roofs of railway stations, public buildings, &c., and we understand that several Government and other important works have already been executed with it.

A collection of high-class furniture and decoration is sent by Messrs. HOWARD & SONS, Berners Street, London, that commands our admiration. Taking the flooring first in order, we find it laid out in various designs of parquet, a class of work with which the name of the firm is meritoriously associated. Many of the designs are unique, and are being much admired. The walls of the bays are covered with mica and flock, embellished with friezes after the style of the Dutch Renaissance, and the work has been economically treated, showing at how low a cost purely art work can be applied to house decoration. The lower part of the walls are finished with dados in deal, oak, and walnut; and in the case of the former wood in particular our recent remarks again apply. So also do they in the case of a wood chimney-piece of deal, painted in enamel colour, and of classic design. An exquisite rosewood chimney-piece in English Renaissance is one of the gems of the exhibit, and this is supplemented by a grate in brass and nickel-plated of original design, and a fender in keeping. The cheaper chimney-piece contains a quaint and original dog-grate in wrought iron that will no doubt draw the attention of many a Birmingham ironworker. A rosewood and satinwood cabinet forms a fitting companion to the chimney-piece before mentioned. It is beautifully inlaid, and has Japanese panels. Some very pretty chairs also formed an attractive feature in the exhibit.

The Birmingham Sanitary Association, Colmore Row,

Birmingham, who represent some of the leading manufacturers of sanitary appliances, make a rather comprehensive display. "Potts's" patent Edinburgh trap is a prominent feature, and there is a good collection of closets of most of the approved makers, including "Wash-out," "Valve," and cottage closets. The Birmingham earth closets form another class, and there are a few baths, lavatories, traps, &c. The company are the agents for the entire Midland district for Messrs. BOYLE & SON, of the Holborn Viaduct, and that firm's various ventilators find a leading place on their stand. The patent air-pump ventilator stands prominently forward, and the patent cowl for arresting the down-blow is also shown. Messrs. BOYLE's improved vertical tubes for the admission of fresh air without draughts or currents, and that are made to any style of internal decoration, and which they have successfully applied in numerous public buildings, notably in the Council Chamber of the Guildhall, London, and the Custom House, Lower Thames Street, are shown; and the new little patent air-heater, attached to the interior of the inlet bracket, by which the fresh air can be warmed to any required temperature, appears to meet with general approval here as elsewhere.

The Bower-Barff Rustless Iron Co., 23 Queen Victoria Street, E.C., and Skin Market Place, Park Street, Southwark, seem determined that if their useful process is not more appreciated it shall be through no laxity on their part in bringing it before the trade and public generally. The latter and not a few of the former have become acquainted with the merits of this invention at the successive building and other exhibitions in London, but, as we mentioned in our report of their last exhibit at Islington, we regret that it has not come into more general use. We are, therefore, pleased to see them here in the centre of manufacturers of every description of iron and steel goods, and the result of their presence in Birmingham will no doubt be that it will be taken up by many firms who have not had an opportunity of previously becoming acquainted with it. The specimens shown comprise all classes of work, both heavy and light, plain and ornamental, as well as samples that have been put to very severe tests and which are none the worse for the exposure to the atmosphere, salt water, &c.

MESSRS. JONES & WILLIS, Temple Row, Birmingham, and Euston Road, N.W., help materially to swell the exhibits in the art metal and decorative department, though the specimens of wrought-iron work are not as numerous or so rich as they sent to the Agricultural Hall. The collection, however, at their stand is not unworthy of them, and taken as a whole undoubtedly puts other exhibitors in the shade. Still, we think had they had more variety it would have been to their and the visitors' mutual benefit. Ecclesiastical work occupied the great part of the stand, and comprised a handsome font in Caen stone, a carved oak lectern, a carved oak chair, a desk, a handsome brass eagle lectern, altar rail, standards, &c. An assortment of their Hesperus lamps, as well as some effective and inexpensive wrought-iron and iron and brass brackets and fittings, suitable for electric lighting, &c., complete the display.

PARIS NOTES.

THE Union of French Working Sculptors has just presented to the Municipal Council a memorial setting forth the precarious position in which native carvers are placed owing to the ever-increasing invasion of foreign workmen. This influx has been occasioned by the over-rapidity with which the execution of the decorative work on public buildings has been hurried on, thus creating a temporary demand for more skilled stone carvers than the French market can supply, and attracting a mass of foreign labour, which, now that work is falling off, is thrown into violent competition with the native workmen. The memorialists demand, therefore, with a view to putting an end to this competition, that for the future all work executed for the city of Paris shall be confided to French masters and carried out by French men only.

The Prefect of Police has laid a proposal before the Municipal Council tending to nominate five architects as special inspectors of lodging-houses, with a view to ensuring strict compliance on the part of owners of such houses with the regulations published in May 1878, which have never hitherto been strictly enforced, owing to the want of the necessary staff. The proposed measure comes not a moment too soon, for the present state of the cheap lodging-houses of Paris leaves, as the French would say themselves, much to be desired.

The Exhibition of Portraits of Celebrities of the past century is now open at the Ecole des Beaux-Arts. It comprises 318 works, among which are 18 by David; 6 by Delacroix including the famous portrait of George Sand; 5 by Delaroche; 12 by Gérard, including the portraits of Prince Eugène, the Duchess of Broglie, Mdlle. Georges, and Mdlle. Mars; 5 by Greuze; 7 by Gros; 9 by Ingres; 1 by Cherubini, of the Duc d'Orleans; 8 by Vigée-Lebrun; 12 by Prudhon, including the Prince de Talleyrand, the King of Rome, and the Empress Joséphine; 2 by Henry Regnault; 9 by Ary Scheffer; 4 by Horace Vernet; 5 by Bonnat; 4 by Baudry; 5 by Delaunay; 3 by Hébert; and 3 by Henner.

The Association of French Painters, Sculptors, and Architects held its annual meeting on Saturday last at the School of Fine Arts. M. du Sommerard, who presided, said that the society now has upwards of 7,000 members, and reserve fund of 1,300,000 francs. MM. Bouguereau, Luminais, Tony Robert Fleury, Cavelier, Hector Leroux, Jules Lefebvre, Ulmann, A. Bonheur, and de Dramard, were elected on the managing committee in place of retiring members.

M. Jules Goupil, a painter of great talent, whose works were perhaps as well known in England as in his own country, has just died at Neuilly of consumption, aged only 43. Among his chief works were the *Jeune Citoyen de l'An V.*, for which he received a third medal in 1873, and his *Merveilleuse*, one of the gems of the 1875 Salon—a female figure in the dress of the Directory epoch, and wearing a Gainsborough hat. For this picture he obtained a first medal.

At the sale of Baron de Schwiter's collection of drawings of the French Seventeenth Century School, several sketches by Boucher, Fragonard, Greuze, and Watteau, realised upwards of 60*l.* a-piece. The total proceeds of the sale amounted to 45,371 francs.

The celebrated Boussac tapestries, consisting of six pieces, have been added to the Cluny Museum. Each of these magnificent examples of the French art of the fifteenth century measures about five yards by four. They are supposed to represent the life of a noble lady at an epoch 100 years or so earlier than the date at which they were produced. In all of them the lady is depicted, now seated, now erect, richly attired in gold brocade and velvet on a verdant flower-spangled islet. On either side of her are a lion and an unicorn—recalling the design of the Royal Arms of Britain—who are sustaining the oriflamme and another standard. On the crimson ground stand out bright plumaged birds and animals, while the grass plot in the centre is diversified with flowers, and forest rabbits and small animals are disporting. In one case the lady is holding a crown of roses presented by a young girl; in another, she wears a pearl-bedecked turban and is touching the keys of an organ; in the third of the series she is issuing from a tent bearing the motto, *A mon seul désir*, while in a fourth piece she bears the unicorn on her knees, the form of the imaginary beast being reflected in a mirror. These woven fabrics are considered almost unique for finished workmanship, elegance of design, and delicate tinting, and yet they narrowly escaped utter destruction before being purchased for 25,000 francs by the Commission of Historic Monuments. The history of their discovery is curious. Chance visitors to the Château of Boussac (Creuse), classed in 1873 as "an historic monument," but used as the sub-prefecture of the locality, had often referred to them, George Sand, among others, describing them in "*Jeanne*." When the representatives of the Commission proceeded to the château, they found that the fabrics had been cut into pieces; about a third of them, it is said, being actually used as carpeting at the sub-prefecture.

After a good deal of haggling, the Commune of Boussac was induced to sell them to the State for the sum above named, and they were at once transferred to the Musée Cluny. There seems every reason to believe, from a careful inspection of the tapestries, that they are of French origin, having probably been worked at Aubusson. Documents just brought to light by M. du Sommerard in the library of the Institute tend, moreover, to show that the heroine was a certain Dame le Veste of Lyons, the lion symbolising her place of residence, and the unicorn, as swiftness, her name.

The Municipal Commission on Cheap Workmen's Dwellings is holding frequent meetings. Within the last few days the question has assumed a new aspect. It will be remembered that when a short time back the Municipal Council adopted a proposal tending to suppress the fortifications and *enceinte*, or strip of vacant land.

kept clear for military purposes all round Paris, the idea was immediately vetoed by the Minister of War. Since then, however, the matter has been referred to a military committee. A conference was held on Saturday last between the Municipal Commission and the representatives of the Engineer Corps, when the Engineers propounded and recommended the adoption of an alternative and far more ambitious scheme. This consists in suppressing the existing *enceinte* and establishing another further out much less wide, the military authorities considering that a ditch 12 mètres deep by 6 mètres wide would suffice to provide against a surprise and prevent smuggling. A very large part of the new *enceinte* already exists in the shape of the rivers Seine and Marne and the Saint Denis Canal, which could be utilised as natural ditches throughout much of their course round Paris, and the circle would be completed by connecting the line of old or inner forts. The cost of this would be comparatively small, and the area of Paris would be more than doubled. The ground thus taken in contains 500,000 inhabitants, who would all have to pay their quota to the City Octroi, and the suppression of the existing *enceinte* would provide no less than 800 hectares (about 2,000 acres) of building land, equal to a tenth of the present Paris surface. The necessary means of communication for the new part of Paris thus created would be in a great measure provided for by the existing Circular Railway, which would become the Metropolitan of Paris. For this it would only be necessary to prolong the omnibus routes as far as the various stations.

MODERN ART-TALK.

AN article on "Naturalness," by Mr. James Payn, appears in the May number of *Longman's Magazine*, and is marked by the keen observation and genial humour of the novelist. One of the types of insincere speech he adduces is that of people who profess to be enthusiastic about art, and of them Mr. Payn says:—

If people would only say what they really think concerning this and that, and above all would say nothing about matters on which they never think at all, social life would be much more interesting. What we hear of the "Decay of Conversation" is true enough, and the phrase in which the complaint is couched is exceedingly appropriate; there is no want of conversation, but it is decayed, rotten; there is neither honest thought nor genuine humour in it, but only pretence and affectation. *Æstheticism* has much to answer for in this matter, and may be said to have driven away what wit and sense still lingered in our drawing-rooms. It is the opportunity of fools; there is no one who has learnt the terms of art who does not think himself qualified to talk about it; and others consent to listen to him upon the understanding that they are presently to have their innings. A very few writers only have shown themselves competent to describe the magnificent effects of sunrise; it would be a dangerous subject to the most eloquent of talkers; yet hundreds of splendidly appparelled men and women are ready every evening to deluge one with their descriptions of some copy of sunrise done with a brush. If the picture were in the room, there might be something to be said about it; but the picture is in Munich, or in Dresden, and these people seem to think that by their chatter about its tints and glows they can not only recall it to one's recollection but recreate it for the benefit of those who have never seen it. When a splendid landscape is lying before him, the man who is most worthy of it does not go into verbal hysterics about it; and though it sinks into his soul, to be reproduced for his pleasure and refreshment afterwards, he will never dream of boring you for half an hour in a London drawing-room with a second-hand view of it; and if nature cannot stand this reproduction, how much less can art! Pictures may, of course, be talked about in their absence, like anything else; but when they are used as texts to be preached upon extempore, one's mind reverts with envy to that great painter who could shift his trumpet and take snuff, till such rhapsodies were over. For affectation and pretence our present art-talk has no parallel except among wine-bibbers who will sometimes discourse about the vintages; but in that case one may good-naturedly say that the dates go well with the olives. One doesn't expect much in the way of talk from toppers; and the wine *is there*, though where it comes from they may not be quite so certain as they think they are. Moreover, when it comes to the vintages, it is probable that the company is more or less drunk, whereas your art-talkers have no such excuse; they are seldom intoxicated, save with the "exuberance of their own verbosity." They talk for talking's sake, or "for the gallery," and, what is worse, their opinions are almost always second-hand, so that there is no sort of naturalness about them. Nevertheless (which shows how a hothouse plant can be made to appear indigenous to the soil) they often express them with great vehemence and acrimony. Mr. A., a collector of pictures, while in company with a friend in his gallery, was called upon by B., an art critic.

"Why, you have got one of Martin's pictures!" cried the latter, his æsthetic indignation making him forgetful of the presence of a stranger. "What on earth have you done *that* for? You surely don't think Martin a *painter*. A more ridiculous, melodramatic—"

"Hush, hush!" whispered A., behind his hand, "that gentleman yonder *is* Martin."

"Well, well, perhaps you are right!" said B., changing front in face of the enemy. "It is just as well to have a specimen of every artist. When I said Mr. Martin was not a painter, I should have added not a painter of the ordinary type: he is a school in himself; and though eccentric, it must be owned that he has the eccentricity of genius. I should like of all things to be introduced to him, but I haven't time," and off he scuttled.

Mr. A. used to say that life was henceforth embittered to him from the fear that B. should some day meet the real Martin and find he was not the man to whom he had apologised profusely and unnecessarily; but for my part I think A. quite justified in playing that little trick upon his visitor, whose condemnation of the painter was probably no whit more genuine than his laudation of him. The very indignation of such people is cant, and very cheap cant.

Insincerity in conversation was probably at its very worst during the late Hamilton sale. Sham admiration touched its apogee—its greatest distance from truth and common sense—in connection with that crazy furniture and its infamous associations. The folly of giving 6,000*l.* for a Louis Quatorze table was portentous, yet not so amazing as the interest professed to be felt in such a fact by the people who didn't buy it. Who can believe, even with the sincerest contempt for the intelligence of his fellow-creatures, that they really cared twopence about it? Yet if that table had been the original Tables of Testimony newly found upon the mount, or if the gewgaws that enriched it had been the lost Urim and Thummim, it could not have been discussed with more eagerness and assiduity.

THE ROYAL MANCHESTER INSTITUTION.

THE annual general meeting of the governors of the Royal Manchester Institution was held on Monday last. The report stated that the result of the annual exhibition of pictures and drawings which was held in the autumn of last year, was financially a considerable loss. The Heywood gold medal was awarded to Mr. H. Clarence White for his water-colour drawing, *A Stronghold of Edward the First*. An exhibition of works comprised in the permanent gallery, together with a loan collection, was held in the months of May, June, and July, and although this exhibition was considered to be of a most interesting character, it occasioned a loss of 137*l.* 11*s.* 8*d.* An action for damage to a picture, bought by Mr. Tourrier, an artist, against the Institution, was decided in favour of the claimant. The Council considered, on the evidence and legal advice on the case, that they were fully justified in defending the action; they were advised by counsel to apply for a new trial, but on full consideration decided not to carry the matter further. The result was a considerable loss. The Council have received during the year, as additions to the permanent gallery, an oil painting, *Flowers*, by H. Fantin, a bequest of the late Mr. Godfrey Gottschalk, and an oil painting, *St. Jérôme*, by Professor Alphonse Legros, the latter being an addition to the very valuable gift of Professor Legros announced to the governors in their report for 1880. Professor Legros has further shown his interest in the Institution by allowing the Council to take a series of twenty bronze medallions from casts made by him, and these are in preparation. All these will now form part of the Permanent Art Gallery of the city of Manchester. The Council report several changes during the year in the list of honorary officials. The transfer of the land and buildings of the Institution, with its permanent gallery of pictures and the other works of art, &c., is now an accomplished fact. The Manchester Corporation Act, 1882, received the Royal assent on August 10, 1882. According to arrangement the Council of the Institution carried out the engagements previously entered into by them until the close of the autumn exhibition in January last, when the Corporation entered into full possession. The governors, in pursuance of the Act, nominated previous to November last seven persons to be their representatives on the Art Gallery Committee of the Town Council, who with the fourteen nominees of the City Council form the Art Gallery Committee. It will be requisite, previous to November next, in general meeting of the society, again to nominate seven representatives. The Council hope and believe that under the management of the Corporation the Institution, now the art gallery of the city, may have a greater measure of usefulness and success in the future that it has had in the past, and that the governors will have no cause to regret the step taken by them in transferring their property to the city for the benefit and enjoyment of the citizens as well as themselves. The governors are reminded that, except in relation to the transfer of the property, the society remains unaltered, with all its rules intact, as well as the privileges of admission of the governors to all exhibitions and lectures.

NOTES AND COMMENTS.

M. EDOUARD MANET, the French painter, has died from exhaustion, after the amputation of his leg. Even by those who most strenuously opposed the style he inaugurated, regret is profoundly expressed for the generous and noble-minded artist who steadily refused to allow interested motives to induce him to swerve from a conception of art which to him was the true one. That EDOUARD MANET'S so-called Impressionism has influenced the contemporary French school neither M. BASTIEN LEPAGE nor M. HENRI GERVEX will deny. Even the landscapists, M. CAZIN and M. DUEZ, have borrowed something indefinable but not less real from his teachings. EDOUARD MANET'S idea was that art ought only to represent the manifest and first-received effects of Nature on the eye, without details, which he denied were discerned from a distance. EDOUARD MANET began his picture by a series of blotches. He maintained, and with a certain amount of truth, that the first impression on the eye consists of contrasted blotches, or, as he defined them, *taches*. Thus, he said, if you look at a man from a distance his silhouette is either dark on a light background or the reverse. His face is a light spot; his figure dark, because of his clothes on the luminous atmosphere by which he is surrounded. As regards a landscape, the first impression on the eye admits of no details; it takes in but a series of blotches of colour infinitely varied, but utterly without detail, which cannot be discerned from a distance. We do not advocate the doctrines of the Ecole des Batignolles, we simply record them.

COURBET anticipated EDOUARD MANET, and while the latter was in Spain studying VELASQUEZ and GOYA, COURBET was painting the huge canvases in which he hurled defiance at the Academy, which, however, has placed two of his most important works in the galleries of the Louvre. MANET'S *Enfant à l'Épée* and *Le Bon Bock*, the two works by which his name will be handed to posterity, have, strange to say, nothing of the Impressionist school. The first has evidently been inspired by VELASQUEZ, the second by FRANZ HALS. Spite the intense suffering caused by the spinal disease which has at so early an age terminated his career, EDOUARD MANET was constantly to be found at work, but he executed nothing worthy of mention since he finished *Le Bon Bock*. Among his best known works it is well to recall a portrait of EMILE ZOLA, his friend and devoted admirer; *Le Déjeuner sur l'Herbe*, *La Leçon de Musique*, *Combat du Kearsage et de l'Alabama*, *Le Repas*, *Le Bon Bock*, the portrait of M. FAURÉ, the singer, and the portrait of his *camarade d'atelier* at Cautières—where both studied—M. ANTONIN PROUST, afterwards Ministre des Arts. M. MANET belonged to an old family of Brittany, and began life as midshipman in the French navy.

Is it usual to give to the architect a copy of a tender which has been sent to some other person, who for that purpose represents the building owner? This is the question which the Birkenhead Corporation are about to consider. Tenders were lately received for the erection of the town-hall, and on Wednesday one from a Mr. LESLIE, which amounted to 40,497*l.*, was recommended for adoption by the Committee. But at the same meeting a letter was read from a contractor, named GABBUTT, stating that his tender was lower than LESLIE'S by about 300*l.* He also said that he had refused as a matter of principle to send a copy of his tender to the architect, the inference being that he was set aside in consequence. It was found besides that tenders had been obtained from specialists for work amounting to about 16,000*l.*, or over a third of the total, and Mr. GABBUTT demurred to the arrangements. In the course of the discussion it was revealed that Mr. LESLIE had sent a telegram, while the Committee were sitting, reducing his tender by 500*l.*, on the ground that one of the special tenders was lower than he had observed. Much importance was attached by some of the Council to the duplicate tenders, and one member said if he had known of them he should either have left the meeting, or have asked the Committee not to deal with the matter. It would perhaps have been better if the architect had waited until the tenders were opened, but there is no reason to assume that there was anything wrong in the desire to possess early information by means of the duplicates. The fact that the majority of the intending con-

tractors were willing to furnish copies shows that they believed they were running no risks.

At the same meeting another difficulty arose in connection with the designs for the new Sessions House. In the competition Mr. ALEXANDER BLEAKLEY, jun., was successful, and it was proposed to invite tenders to carry out the work. Before the proposal was adopted a circular was read from seven of the competitors suggesting that a report from a professional referee should be obtained on the design, and there was a letter from Mr. HESKETH, of Liverpool, who said that his plans had been set aside because they were twenty-four hours late. It was afterwards resolved "that the whole question of the selection of plans and designs for the new Sessions Court, &c., be reconsidered, and that it is desirable that the assistance of a professional referee should be called in to advise the Committee as to the relative merits of the designs which were sent in not later than March 31." A motion that all the plans of whatever date should be considered by the referee was rejected.

COMPETITION between architects will give rise to even more heart-burning if the precedent which has been set at Newcastle is adopted. The Church of St. Nicholas, which is now the cathedral, is to be restored, and as a matter of course it was necessary to appoint an architect. A meeting was held on Monday to consider the subject. A letter was read from Mr. J. O. SCOTT, who volunteered to present a design for the reredos, and a precisely similar offer was made by a local architect, Mr. THOMPSON. But in favour of Mr. JOHNSON, another local architect, there was something more substantial, for a reredos complete was offered instead of a design on paper. A Mr. WESTMACOTT informed the bishop that he was willing to expend 4,000*l.* on a reredos if Mr. JOHNSON prepared the design. It is needless to say what was the result, and not only the reredos but the whole of the restoration is to be entrusted to Mr. JOHNSON. Personally, there is nothing can be said against the appointment. Mr. JOHNSON is an able man, and he is moreover diocesan architect. But the way in which he was selected is strange. Supposing some other architect were fortunate in finding a patron who was willing to expend four thousand guineas on the restoration, would he not stand a better chance of securing the appointment? Newcastle has again shown itself to be "canny," but it will be a bad day for the profession if architects, like sporting men, must find backers to gain employment.

THE President, Council, and Members of the Institute of Water-Colours have proved themselves to be adepts in the preparation of elaborate compliments. In the address which was presented to the Prince of Wales, on the opening of the galleries, there were several examples of their skill. Allusion was made to the Free Schools of the Institute, but, said the writers of the address, "We do not wish to convey the impression that these schools will be open to all, however inexperienced. We desire, rather, to follow the lines so admirably laid down by your Royal Highness in the regulations of the Royal College of Music, and train only those likely hereafter to distinguish themselves in the profession." What is meant by distinguished it would be difficult to explain. Do the members mean that they are all entitled to claim that adjective? Or is it intended that the new schools are to reject all students who are not embryo TURNERS, HUNTS, and COXES? The regulations of the College of Music have yet to be tested, and surely, as we know more of painting than of music in England, there should be little difficulty in devising regulations for an art school without following strange "lines."

MR. DAVID RHIND, who was one of the best known among the architects of Scotland, died in London on April 26. It was in London that he received his early professional education. About fifty years ago he commenced practice in Edinburgh. He was fortunate in gaining the appointment of architect to the Commercial Bank, and throughout Scotland the branches have been erected from his designs. Among his buildings in Edinburgh are the offices of the Commercial Bank, the Normal College, the Bedford Hotel, and the offices of the Life Association. Mr. RHIND designed many of the Sheriff Court-houses in country towns. Like the late DAVID BRYCE, Mr. RHIND was one of the old school of architects, men who appeared to be unacquainted with worries like those which beset their successors.

WALL-PAINTING IN THE PANTHEON.—I.

IF by some edict all the churches in Paris were ordered to be destroyed, and the sites to be utilised as a means of lightening the public debt, it is most probable that the citizens of Paris would unite in memorialising the Government to spare the Church of St. GENEVIÈVE. It is hardly a century old, and it is difficult to say whether it is a panthéon or a church, a public building for some undefined purpose or a place where devotees can assemble round the relics of the saint. Just as in Glasgow Cathedral we find civic officers always on duty (one of them, by-the-by, is quite an authority on glass-painting), so in the Church of St. GENEVIÈVE there are policemen whose use it is difficult to comprehend, unless their presence insures the ownership of the building to the Municipal Council. No less remarkable is the circumstance that the authorities, who apparently scorn all things connected with religion, are willing to pay for the representation of scenes in the life of St. GENEVIÈVE. Looking at what is in progress in the Church, she would seem to be to-day, and under a Republican Government, no less the patroness of Paris than she was in the time of St. Louis.

The decoration of the interior of the building has formed a sort of competition between various styles of painting. The spandrels of the dome were filled with figures by GROS several years ago, and they were thought to be so successful, that the painter was made a baron of France, in order to reward him. But the principle adopted for them was the common one, that the paintings were of more importance than the building. The example of GROS has been followed by other artists, who have endeavoured to make their work as emphatic as possible, by having the strongest contrast between their pictures and the white walls and pilasters. M. PUVIS DE CHAVANNES' principle is entirely different. He believes that decoration is only subsidiary, and he has treated his large paintings in such a way that the masonry around them is not sacrificed. When it is remembered that the stonework of the church is a creamy white, the difficulty will be apparent, and on this account there are few modern examples of wall-painting better worth studying than those of M. PUVIS DE CHAVANNES. Opinions may differ about the character of his figures, and it may be said that they are not so well modelled as those to be found in some other panels in the church, but there ought to be no question about the principle which inspired his pictures. His rivals apparently believe there is little difference between an easel picture and a mural painting—and there are pictures in the church which would look far better if they could be transferred elsewhere. But M. PUVIS DE CHAVANNES' scenes would lose much if placed in any other position. The colouring is kept low, and the figures have not the finish of a miniature, simply because the painter believes that in mural work much must be left undone to secure proper effect. The character of the paintings will be suggested by the illustration.

St. GENEVIÈVE was born in the early part of the fifth century at Nanterre, and thus might almost be said to be a Parisian. Accounts differ about her position, but those which are most credible represent her to be of humble parentage. At a time when paganism prevailed, and France was passing through the primitive stages of civilisation, the piety and heroism of St. GENEVIÈVE were remarkable. She was a notability, like the Maid of Orleans in after years. The representation of the legends relating to the early part of her career was allotted to M. PUVIS DE CHAVANNES, who in his first scene shows the child praying in the fields near Paris.

BRACEBRIDGE HALL, LINCOLN.

THIS mansion is now approaching completion, and is very beautifully decorated, particularly the private chapel and entrance hall. The latter is 30 feet by 20 feet, and 26 feet high, with opened panelled roof and mahogany ground inlaid with sycamore and other valuable woods. The dado is of similar character, and 6 feet 6 inches high. The floor is of coloured marble.

The works have been carried out from the designs of Mr. ALBERT VICARS, of 151 Strand, London. The contractor is Mr. WRIGHT, of Lincoln. The painted windows and frieze of entrance hall, representing scenes from the "Merry Wives of Windsor," were executed by Messrs. MEYER & Co., of Munich. The internal ornamental plasterer's work and the

carving has been done by Messrs. FAMBRINA & DANIELS, of Lincoln; the marble paving by Messrs. BURKE & Co., of Newman Street, Oxford Street; the panelling of roof, hall, &c., by Messrs. HOWARD & SONS, of Berners Street.

ILKESTON ROAD BOARD SCHOOLS, NOTTINGHAM.

THESE schools are now in course of erection for the Nottingham School Board, from the designs of Mr. A. H. GOODALL, architect, of the same town; the contractor being Mr. LUKE SCATTERGOOD, whose estimate for the whole work is 7,170*l*.

The materials used are local red bricks, with deep red terra-cotta dressings from the works of Messrs. WILCOCK & Co., Burmantofts, Leeds, whose earthenware troughs, with self-acting apparatus, will also be used for the latrines. The roofs will be covered with red tiles. There will be covered playgrounds for each department.

The schools are planned on "the class-room principle," and accommodation is provided for 240 boys, 240 girls, and 320 infants, making a total of 800. Additional provision for 200 children may be made at any time by the erection of another class-room to each department.

The heating will be by hot-water pipes. The area of site is over 4,000 square yards.

COLCHESTER VILLAS, TRURO.

THESE houses were erected for Mr. T. L. DORRINGTON and Mr. HARRY LOWRY, members of the Town Council. Each house contains eleven or twelve rooms. The walls are faced with Plymouth limestone, the dressings being of soft granite from St. Stephens. The builders were Messrs. FARLEY & TIPPEL, of Truro, and the architect Mr. JAMES HICKS, of Redruth.

"HIGHFIELD," REDRUTH.

THIS house was erected by Mr. HICKS, architect, for his own residence, and is situate alongside the Church of St. Andrew, now in course of erection. The walls are faced with local stone, with granite dressings for the plain parts, and Box ground Bath stone for cornices, &c.

From the balcony of this house there is a view of about nine miles of coast scenery towards the Atlantic.

THE WELLINGTON STATUE.

THE following is the report of the Wellington Statue Committee: "The committee appointed to consider the future site to be adopted for the colossal statue of the Duke of Wellington, by Wyatt, met at Apsley House, on April 25, 1883. Present, the Duke of Wellington, K.G., the Viscount Hardinge, Sir F. Leighton, P.R.A., Mr. Boehm, R.A., Mr. Fergusson, Mr. Mitford, C.B. The Duke of Wellington was voted to the chair.

"Mr. Mitford informed the committee that various sites had been suggested, of which the chief were: The Apsley House site, the Horse Guards site, Chelsea Hospital, Primrose Hill, the Tower of London, an exchange of sites with the statue of *Achilles* in Hyde Park, Knightsbridge Barracks.

"Having regard to the unsuitableness of some of the sites and the distance of others, the committee considered that the discussion might be narrowed to the two first of these sites, namely, the Apsley House site and the Horse Guards.

"The committee felt that in considering the question due regard must be had for the memory of the illustrious warrior whom the statue commemorates. Even had it been for other reasons altogether appropriate, they would have had hesitation in recommending its retention in its present place on the ground of its colossal size. They are of opinion that while it is desirable to place it in some position befitting the military achievements of the Duke of Wellington, it would be out of harmony with its surrounding at Hyde Park Corner.

"They recommend, therefore, that the statue should be placed upon a fitting pedestal upon a site immediately within the present railings of St. James's Park, facing the Horse Guards, and upon the central axis of the archway of that building."

Messrs. Stuart & Co., of Edinburgh, have been awarded by the authorities at Washington, U.S., the contracts for the paving works connected with the new Post Office and Customs House at New Orleans, and the new Post Office at Hartford, Connecticut. Last year Messrs. Stuart & Co. obtained several similar contracts in connection with new public offices in America.

THE ASHBURNHAM MANUSCRIPTS.

THE Trustees of the British Museum have received a letter from the Treasury announcing that after careful consideration, the Government has decided not to sanction the purchase of the Ashburnham MSS. *en bloc*; but at the same time, it was added, the Government was prepared to consider any recommendation that the Trustees could make for the acquisition of a portion of the collection. The Trustees have since the receipt of the letter done what is practicable to try to secure that portion which is of an essentially English character. Lord Ashburnham has been communicated with, and has consented to divide his collections so far as to offer the Stowe MSS. and the Appendix alone. These sections the Trustees have recommended the Government to purchase, and their recommendation is now before the Government. In the former are comprised the State papers, monastic registers, Anglo-Saxon charters, Irish manuscripts, and other important documents; in the latter, the English manuscripts, Wycliffes, Chaucers, &c., some Dantes, and especially the great jewelled binding and the fine illuminated manuscripts, including the Albani missal. The Libri and Barrois collections have been eliminated from the negotiations, and the museum will, therefore, lose the opportunity of securing most of the Dantes, the romances, Italian literature and early correspondence, the finely-illuminated manuscript (written by Sinibaldo), executed for Lorenzo de' Medici, and the bindings in ivory. Lord Ashburnham will probably find another market for them. The arrangement clears the ground of all complication with the French; and as everyone recognises the essentially English character of the portion now recommended to be purchased, it is to be hoped that the Government will consent.

THE IMPROVEMENTS AT HYDE PARK CORNER.

IT will be remembered, says the *Times*, that on March 28 last year Mr. Shaw-Lefevre announced in the House of Commons that he proposed to endeavour to find a remedy for the block at Hyde Park Corner. The subject was one which for many years had engaged the attention of successive First Commissioners of Works, but it was not until 1874 that it was brought before Parliament. In that year it gave rise to many questions in the House of Commons, and Lord Henry Lennox, then presiding over the Office of Works, was so impressed with the need of some alteration that he assured the House that works would be begun as soon as possible. In the following year the sum of 5,000*l.* was actually voted by Parliament as an instalment for the purpose of making a road from the bottom of Hamilton Place to Grosvenor Place, passing under Constitution Hill. In the early part of 1876, however, Lord Henry Lennox was obliged to confess that the objections to the scheme which he had proposed to carry out were found to be insuperable; later in the year he said that, after long and anxious consideration, he had approved a fresh plan, which was understood to be a road in the same direction, but crossing Constitution Hill on the level; and at the close of the session he again assured the House that the matter should receive the immediate attention of the Government. At the beginning of the session of 1877 Lord Beaconsfield, in the course of a debate on the subject, informed the House of Lords that the matter had not been neglected by the Government, but that the difficulties were considerable, and not the least of them that of the expense; and Mr. Noel, in the House of Commons, said that he must defer dealing with the question owing to want of funds. From this time the many difficulties to be overcome appear to have dismayed the authorities, and the matter was allowed to sleep until Mr. Shaw-Lefevre entered upon his present office.

On announcing his intention to provide a remedy he stated that, after careful consideration of all the numerous schemes which had been devised in the Department during the last ten years, or which had been proposed to it from other quarters, he had adopted one which had been prepared some years before at the Office of Works at the suggestion of Mr. A. B. Mitford, the secretary. It drew a line across the corner of the Green Park from Hamilton Place to Halkin Street, and converted the park-land to the west of the line into an open place intersected by the necessary roads. It proposed to remove the Wellington Arch from its position opposite to the entrance of Hyde Park to the point where Constitution Hill would join the new place. These bold changes involved, however, a large expenditure, and considerations of expense which had wrecked many previous schemes seemed likely to be fatal to this one also. The Government did not feel justified in submitting a vote to Parliament to meet the cost, and under these circumstances Mr. Shaw-Lefevre had to look elsewhere for the necessary funds. After some negotiation, the Metropolitan Board was induced to contribute a sum of 20,000*l.* towards the scheme as a great metropolitan improvement, and the Duke of Westminster offered to add 3,000*l.* more in respect of the interest of his property in Belgravia. It was also arranged that the Office of Woods, representing the Crown estates in the neighbourhood, would, for similar reasons, contribute to the fund; but this arrangement subsequently fell through.

The total estimate for the work was 28,000*l.* This included the cost of removing the reservoir which supplied the public offices with water from the point at which it stood in the corner of the Green Park affected by the scheme to a higher point in the centre of Hyde Park. As the additional height to be obtained by this removal was of very great importance in increasing the pressure of water, and therefore adding to the security of the public buildings against fire, the Government agreed to advance this much to the scheme, and a vote for 3,000*l.* was submitted to the House of Commons, supplemented later by a further vote for 1,700*l.*, which formed the only direct contribution of the Government to the improvement. The scheme met with general approval, but on August 12, on the discussion of the vote, Lord Elcho (now Lord Wemyss) took the opportunity of objecting, and of proposing an alternative scheme. He stated that the Society of Architects had expressed their disapproval of the plan of the Government. Among other objections, they alleged that the removal of the arch would destroy a well-balanced architectural group, involving an expenditure which they considered had little or nothing to recommend it. If the arch were removed St. George's Hospital would be the main feature of the thoroughfare, whereas it was at present entirely hidden from view. They objected also to the proposed new site for the arch, on the ground that it would be askew to the other buildings in the neighbourhood. The rival proposal of Lord Elcho was to throw open to the public the road from Stanhope Gate to Hyde Park Corner, and to turn Mr. Burton's ornamental colonnade to a position at right angles to its present line, thus making a new entrance to Hyde Park.

Mr. Shaw-Lefevre defended his scheme on the ground that it had received the sanction of many of the highest authorities in art, and that the removal of the arch was a necessary condition of it. He showed that if the arch were left in its then position and the remainder of the scheme carried out, the gradients would require that the road between the two parks should not pass under it, but round it, and through one of the side gates into Hyde Park, and thus all the dignity of the approach would be lost. With respect to the proposed new position of the arch, he denied that there was any canon of art requiring that buildings should be parallel or at right angles to one another, and he quoted many examples to the contrary. He showed that the arch would be at some distance from the surrounding buildings and would not be brought into conflict with them, while the effect of an open place, bounded on the one hand by the houses of Grosvenor Place and on the other by those in Piccadilly Terrace, opening out Mr. Burton's beautiful colonnade, would be very striking. The House of Commons was not persuaded by Lord Elcho, and the necessary sum was voted. It may here be mentioned that the members of the Royal Academy had addressed an almost unanimous memorial to the Government, praying that advantage might be taken of the opportunity to remove the statue of the Duke of Wellington from the arch, a position which was considered as wholly opposed to every consideration of good taste. Upon this the Government decided that the statue was not to be replaced on the arch after the rebuilding of the latter in its new position.

The works were put up to public competition in October last, and the tender of Messrs. Mowlem & Burt for 27,900*l.* was accepted, including 3,000*l.* for the removal of the reservoir. The works were begun at the end of October, and have been pushed forward by the contractors with the utmost energy.

The work of lowering the statue of the Duke of Wellington was begun on January 18. The method adopted to carry out this delicate operation may be briefly described. Hydraulic rams were placed under the four corners of the statue in such a manner as to enable the workmen to raise or to depress it at will. One end of the statue was first raised clear of the stonework; the masonry was then knocked away to the depth of a few inches beneath it, and the statue brought down again upon the rams, so as to rest once more upon the masonry. By repeating this process at alternate ends the statue was safely brought to the ground in six weeks.

To obtain the proper level for the new place it was necessary to remove from the site some 20,000 cubic yards of soil; this has been conveyed a few hundred yards to the eastward and formed into a mound between Constitution Hill and the footpath which crosses the Green Park diagonally from Hyde Park Corner to Stafford House. When the grass and trees on the new mound have grown up, this walk, always one of the most beautiful in the London parks, will, it is believed, be greatly improved, and, seen from the east side of the Green Park, the new rising ground, with the reconstructed arch beyond it, will form a new and pleasing feature in the landscape.

The improvement has been effected at a loss of little more than three-quarters of an acre of park land, after allowing for the ornamental gardens to be laid out in the place; and, while there is every ground for the belief that it will afford a more complete relief to the traffic than any other scheme which has been proposed, it is gratifying to know that this has been done at the smallest possible sacrifice of the park. In the new place itself we have one of the most important changes which have been made in London in our time. The effect produced by the formation of the fine open space certainly surpasses expectation. Now that the arch is gone it must be obvious to everyone that its site was ill-chosen. The

graceful lines of the ornamental screen at the entrance to Hyde Park gain in every way by the absence of the heavy masonry of the arch, and it is plain that the proportions of the arch and the screen were too dissimilar in character to form a satisfactory architectural group.

The work of reconstructing the arch at the head of Constitution Hill is now in progress, and there can be no doubt that it will be seen far better both from the east and the west than on its old site, where it was crowded up into a corner, and was too close to other buildings to be seen from any point with advantage.

The road from Hamilton Place to Halkin Street will be thrown open to-day (Tuesday), which fulfils to the letter the promise made by the First Commissioner more than a year ago; the rebuilding of the arch will necessarily take some months longer. It was at one time contemplated to remove the arch bodily, with the statue upon it, to its new position; this, however, was abandoned by the advice of Mr. John Fowler, in view of the treacherous nature of the ground over which the removal would have been effected. The demolition of the arch, with a view to its being rebuilt on the new site, has naturally involved the lowering of the statue to the ground. The contract price does not include the removal of the statue to the site proposed for it by the committee to whom the question was referred, nor the construction of a new pedestal for it, which will become necessary.

Apart from this, the whole improvement will be completed within the sum of 28,000*l.*, which will not be considered a large amount in proportion to the magnitude of the work, and the important effect it will have upon the general appearance and convenience of this the very centre of modern London.

THE IPSWICH CORN EXCHANGE.

A SPECIAL meeting of the Ipswich Corporation was held last week when, says the *Ipswich Journal*, the Post Office and Corn Exchange Committee presented a long report, in which they stated that on October 18 last Mr. Binyon, the architect for the new Corn Exchange, submitted a summary of account, showing the balance then due to Messrs. Grimwood & Sons, the contractors. Mr. Binyon was then informed that detailed accounts would be required, and these were accordingly furnished by him in February last. Upon examination the committee found a large sum charged for extra works which had not been brought under their consideration or sanctioned by them. These the committee examined, and presented a summary of them in the form of a series of accounts. Account A showed that the amount of contract for building was 21,950*l.*; the extra work in the foundations and shoring up and underpinning the Town Hall and expenses in connection with laying the foundation stone, as sanctioned by the Council, 1,170*l.* 9*s.* 9*d.*; total, 23,120*l.* 9*s.* 9*d.* Account B comprised the extra works ordered by the committee amounting to 369*l.* 4*s.* 11*d.*, and account C included alterations sanctioned by the committee on the representation of the architect that no extra expense would be occasioned by their so doing, amounting to 314*l.* 2*s.* 6*d.* Account D comprised the works done without the order and sanction of the committee. They were as follows: Cost of tramway in cellar, and car for same, 61*l.* 2*s.*; lightning conductor, and fixing same, 11*l.*; additional cost of carving, 104*l.* 18*s.*; laying on gas to shops and offices, and gas fittings for the Municipal Offices and Corn Exchange, 41*l.* 2*s.* 6*d.*; extra cost of heating apparatus and works connected therewith, 129*l.* 19*s.* 2*d.*; walking ways and ladders on roof of Exchange, 42*l.* 8*s.*; extra work in drainage, 51*l.* 10*s.* 3*d.*; ventilators in roof of Exchange, and rods and apparatus for opening and closing same, 46*l.* 16*s.* 6*d.*; extra cost of entrance gates, and iron railings and gates to shops, 56*l.* 2*s.* 4*d.*; leading brick cornices, and forming outside lead gutter to main cornice, to take all water from roofs on the outside instead of carrying the rain-water pipes down inside the walls, 101*l.* 5*s.* 7*d.*; cost of additional half principal at end of Exchange in recess, 43*l.* 16*s.* 4*d.*; extra work and tie-rod to large arch in Exchange, 95*l.* 8*s.* 6*d.*; extra cost of terra-cotta work, and pointing same, 269*l.* 4*s.*; extra plumbing and working connected therewith, 257*l.* 11*s.* 3*d.*; additional deck lights in floor of Exchange, raising dado, forming floor over large lobby, tuck pointing brickwork inside of Exchange in lieu of trowel pointing, forming steps in area, Lion Street, forming two closets on stairs, and archway in angle shop, &c., &c., 335*l.* 8*s.* 9*d.*; extra cost of urinals, 18*l.* 14*s.* 6*d.*; extra cost of jib and crane, 6*l.* 17*s.* 1*d.*; raising and altering purlin roof ladder, and trap-doors for access to same, 49*l.* 19*s.* 9*d.*; ventilating cellars, 35*l.* 11*s.*; extra foundation to cellar walls, 12*l.* 16*s.* 6*d.*; total, 1,771*l.* 12*s.* The committee requested Mr. Binyon to give a written explanation respecting the various items comprised in C and D. At the meeting of the committee on February 16 last, the committee had before them Mr. Binyon's certificate that the sum of 1,205*l.* 5*s.* 11*d.* was due to Messrs. Grimwood & Sons, the contractors. Mr. Binyon had also delivered to the committee his account, showing a balance of 380*l.* 5*s.* 3*d.* due to him for commission. As requested by the committee, Mr. Binyon sent a full statement of the reasons which led to the various extra amounts upon which the committee wished

for further information, and also of some of the advantages gained by such deviations from the contract. With regard to the extra work and tie-rod to the large arch, Mr. Binyon observes: "The arch in question is of very unusual span, viz., 40 feet, and required a much more complicated centering than had been allowed for, and in order to have the whole thing secure beyond any possibility of settlement, I took more than ordinary precautions about it, and had the whole arch and the gable wall above it built in cement, and also introduced an iron tie rod for additional security. I consulted an engineer on this point, and he considered that these were necessary precautions. I may add that the arch in question is an exceptionally fine piece of brickwork, and I have not been able to discover any flaw or sign of settlement." Other items were fully explained in the report, and Mr. Binyon concluded his letter to the committee as follows:

"In a building of this size any slight increase of the cost of any one article or description of work means a considerable sum.

"All the work has been carefully measured and valued, and nothing has been allowed that the builder is not entitled to.

"I exceedingly regret that the committee did not raise the question of paying these accounts when they were first presented, as I had at hand then all particulars ready for laying before the committee, should they have required them; and upon the strength of what passed at the meeting of October 18, 1882, I felt there was no difficulty in the way of granting the builders the final certificate for the balance due to them."

After some discussion, it was resolved to refer the matter to a committee of the whole Council.

LONDON ROAD BARS.

ONE of the peculiarities of London is the number of gates, bars, rails, and posts which impede the traffic. Toll bars have been abolished, there are no longer toll collectors on the bridges, but the obstructions in certain streets appear to defy legislation. In some cases their immunity might be supposed to arise from the influence of the owners, but there are cases where the gates belong to people who are neither rich nor powerful, and some other reason must, therefore, be sought to explain the existence of things which are in opposition to modern ideas.

When obstructions in streets are mentioned, the gates and bars in the Bloomsbury district are referred to as if they were the only examples to be discovered. But nearly all the large parishes in the metropolis possess those strange manifestations of the rights of property. What is more remarkable, they are to be found in the outlying districts. No part of Hammersmith is dual property, but there are thirty-two streets and roads in the parish in which traffic is daily stopped by means of wooden gates, fences, posts and rails, swing-bars, and even by brick walls. There are no regulations to control the obstructions, and the local authorities are ignorant of the authority under which they have been created. In the Wandsworth district there are twenty-six of those obstructions; the Lewisham district possesses twenty-eight of them.

In most places the gates are supposed to have been erected on roads or streets which at the time were private property. But, strange to say, if the roads or streets are made over to the public it does not necessarily follow that the obstructions are removed. The gates in Harewood Place and Lisson Grove, Marylebone, were put up by the freeholder on dedicating Harewood Place to the public. Proceedings were taken by him against the vestry for removing the obstruction, and it was held by the Court of Common Pleas that the gates were not removable by law, the dedication of the street not comprising the part where the gates were erected, and that the powers of the vestry for removing obstructions did not apply to the removal of these gates. In this case, it is understood that in laying out the ground for building originally, the freeholder undertook to erect these gates. In a parish like St. Pancras, in which there are great properties like the Camden, Bedford, Doughty, and Foundling Hospital estates, it is not difficult to trace the original authority for the obstructions. In some other parishes the rights are less clear. Thus, for example, in the parish of St. Giles, Camberwell, there are sixteen bars, gates, and other barriers, but with the exception of one case among them the authorities of the vestry profess to be ignorant of the nature of the titles.

The owners of the gates can hand over their rights in them to the vestries or other local authorities; but this is rarely attempted. It is often found that the opposition to the transference arises from the inhabitants of houses near the gates. In 1879, it was proposed to ask the Duke of Bedford to remove the gates in Gordon Street. The vicar of the church of All Saints in Gordon Square, as a resident on the estate, opposed the alteration, and declared his readiness to co-operate with other people of a like mind. Another resident foretold that if the "innovation" were accomplished the property in the neighbourhood would immediately decrease in value, and, therefore, the proposed removal was "a suicidal policy." A third ratepayer on announcing his intention to take legal means for the protection of his rights, that is for the retention of the gate at the end of the street in which he possessed a house, gave some reasons in favour of the existence of the ob-

structions. "It must be borne in mind," he wrote, "that the Duke of Bedford's estate was laid out as a residential one, and, being in central London, its residential character could not be maintained if the general goods and omnibus traffic of a wide metropolitan area were to converge into its quiet streets and squares. Such exemption from the annoyance of general through traffic is a vested legal right. Its maintenance preserves the character and repute of the estate as a residential one. Destroy such right, and the whole neighbourhood would rapidly deteriorate in residential repute, and in rental and rateable value. I am entitled also to remind the vestry that for many years in the street wherein I reside not one farthing has had to be spent on repairs of our roadway, although as ratepayers, I and my neighbours have been rated on a basis of value due to the very residential advantage afforded by the protection of the gates. A claim is all the more valid if it is not inconsistent with grounds of public policy, and I venture to assert that central London—that St. Pancras parish—will not benefit; but, on the contrary, will receive injury for which the parish will obtain no compensation if an important rateable area loses a residential advantage, which induces a large number of private and professional gentlemen to make their homes within St. Pancras parish instead of at the West End or in the suburbs of the metropolis."

In 1865 the late Marquis of Westminster gave his consent to remove the bars, gates, rails, and fences on his lordship's estate in Pimlico or South Belgravia, and in the parish of St. George, Hanover Square. Here again there was opposition. The Cubitt executors, who claimed to be part proprietors, contended that the Marquis could not authorise the removal of the bars. The roads, it was said, were formed at the cost of the late Mr. Cubitt; the sites of them are included in his agreements, under which a vast amount of money has been laid out on the estate by Mr. Cubitt and his representatives. The executors threatened to apply for an injunction against the Marquis and the local board. It may have been fear of the result which induced the vestry to decline to avail themselves of his lordship's consent. Six years afterwards, that is in 1871, the vestry of St. George, Hanover Square, proposed to ask the Marquis of Westminster to have all the bars and gates on his lordship's estate in Knightsbridge and outwards removed and the roads and streets thrown open to the public use. The motion was opposed on the ground that many of the inhabitants of the Belgravia district were in favour of maintaining the bars and gates and gatekeepers' boxes. But there were twenty members in favour of the motion, while there were only fourteen voted against it. The committee prepared the following statement, which is no less applicable to other parts of the metropolis, giving the reasons why they considered it to be advisable that the gates and bars should be removed.

1. In the interest of the general public traffic, which is much hindered by their existence. The vestry have reason to believe that the gates were intended to procure the privacy of the locality when the roads were maintained by the building owners; that the roads are now maintained at the expense of the public. That since the bars were established the character of the locality has greatly changed, three railway stations having been formed at one side and a bridge across the Thames at the other side, to neither of which can access be obtained from certain places by the most direct roads. A large share of the traffic is of a local nature, and the existence of the bars in a great measure inconveniences the inhabitants of the parish by compelling them to traverse extra distances to arrive at places on the Marquis of Westminster's estate, thus causing an unnecessary wear and tear of the roads, and giving rise to complaints from many parishioners that the heaviest traffic is compelled in very unfair proportions to pass their residences. Besides which for a long time past considerable irritation has been caused from the fact that over 30% per annum is required from the ratepayers to light up these obstructions, and dissatisfaction has been expressed that the Vestry or their predecessors undertook the burden of maintaining and lighting the roads before the obstructions thereon were removed.

The bars are highly calculated to jeopardise both life and limb, in evidence of which the vestry refer to the numerous accidents which have occurred in consequence of them. Their existence gives rise to a great deal of local jealousy from the fact that some tradesmen's carts are permitted to pass upon payment to the gatekeepers, whilst in some few other cases permission to pass is given by the committee of management.

The tendency of present legislation is to remove all obstructions of this nature from the streets, and large payments are annually made by the ratepayers of the metropolis for this purpose.

2. That the objects sought to be obtained by the erection of the bars are now met by the regulations in force under the Metropolitan Streets Act, 1867, a copy of which is appended. No cattle can pass through any of the streets; see Section 7 of the Act. Waggon and heavy merchandise are not allowed to pass through Knightsbridge or Piccadilly (these thoroughfares being within the special limits of the Act, see Section 10), and, therefore, such traffic cannot pass through any part of the district in which these obstructions exist.

3. That these obstructions are contrary to the general highway

law of the country. A street is a highway over which all Her Majesty's subjects have an equal right of free passage. To obstruct this highway in the smallest degree is not only an indictable offence at common law, but is subject to a penalty under the Highway Act to be summarily imposed by justices. It has been held that even the erection of a telegraph pole by the roadside is an indictable obstruction, although in fact it stands in nobody's way, the right of the subject being to traverse every part of the highway if he pleases.

4. That the removal would not deteriorate the value of the houses in the district, in evidence of which the vestry have only to refer to the mansions in Grosvenor Square and the neighbourhood, where no complaint is made of the nature of the traffic which passes through those thoroughfares.

That it would be a noble act on the part of Lord Westminster to grant this concession to the public and the ratepayers of this parish, and would be an example which would doubtless be quickly followed by other freeholders in the metropolis.

The Marquis of Westminster, having protests from owners and inhabitants of houses in Belgravia and South Belgravia against the application of the vestry being acceded to, such protests being mainly grounded on the assertion that in the opinion of those owners and inhabitants a breach of faith would be committed were his lordship to consent to the removal of the bars and gates which existed when they built or took the houses, was compelled to say that, under the circumstances of the case, he must withhold his consent to the removal of the bars and gates. This case suggests the difficulty of dealing with the subject. On the one hand are the authorities of the metropolis, who say the existing state of things is not consistent with the spirit of the present age, however much the inhabitants of London half a century ago may have failed to recognise the importance of free communications, and have therefore been indifferent to the establishment of such obstructions.

Against them are opposed the real or imaginary interests of the owners and occupiers of houses in the neighbourhood of the obstructions, and the question is whether the principle of free thoroughfares is to be sacrificed to them. In carrying out all improvements, interests have to be sacrificed, and there is no reason why the quietude of a street may not be made a subject for valuation as well as other advantages belonging to a property. Let compensation be granted wherever it is due if the outlay will secure free thoroughfares throughout the metropolis.

DOCUMENTARY ANNALS OF THE ARCHBISHOPS AT CROYDON PALACE.*

BY S. W. KERSHAW, F.S.A.

ARCHIVES and MSS. supply some of the most important links in tracing the history of our ancient buildings and their inhabitants. Documents relating to the Archbishops of Canterbury are above all valuable, especially in earlier times, when sovereign, primate, and nobles were often called to discuss and decide together on the weighty questions of the day. Great ecclesiastical matters were then arranged and methodised under the authority of successive archbishops, and such memoranda form the leading feature of what are called the "Archiepiscopal Registers," long preserved in the library of Lambeth Palace. In an unbroken series from Archbishop Peckham in 1279 to the late Archbishop Tait, these noble volumes indicate all that has officially transpired during each Archiepiscopate. The archbishops in early times had their different palaces or manor houses, as they were called, in the counties of Kent, Surrey, and Sussex, and from these houses the primate made his different journeys or visitations in the diocese, and the record of what took place has been preserved in the volumes I have just mentioned. We constantly find letters and documents dated from many of these houses; in fact, the business of the see followed the archbishop wherever he went, and what is now transacted by the officials of the province of Canterbury was then performed by the secretary or scribe of the archbishop, who accompanied the primate in his journeys to these houses, and recorded the proceedings of every day. This registrar, or writer of their acts, had an office in each of the palaces where the archbishops resided. Thus, in the register of Archbishop Islip, folio 110, we find mention of "Camera Registrarii apud la Forde" (Forde was one of the archbishop's houses in Kent). Such letters and official acts were dated from Mortlake, Lambeth, Croydon, in Surrey; in Kent, from Forde, Knole, Lyninge, Maidstone, Otford, Saltwood, Wrotham; and in Sussex from Mayfield, Slindon, Tarring. Croydon, partly from its proximity to London, and other reasons, was the residence of the archbishops from early ages. We have heard that the manor of Croydon belonged to the see of Canterbury from Lanfranc's time, and that the manor house was built in the interval between Lanfranc and Peckham, 1279.

* A paper read at a special meeting of the Surrey Archaeological Society, in the old palace, Croydon, April 28, 1883.

These houses, besides being inhabited by the archbishop, supplied in some measure entertainment upon the road, of which the country was then entirely destitute. Thus we read of Archbishop Stafford, on his way from Canterbury to the Parliament in 1341, being accommodated at some one of these houses.

Archbishop Kilwardby is the first instance of an archbishop who lived at Croydon. History then records a long succession of primates from Archbishop Peckham in 1279, to the days of Hutton in 1760, who more or less resided at this ancient palace.

We now pass in rapid review, the lives, transactions, and stately occurrences that have thrown round this palace an enduring fame, and have enshrined its history with the acts of our church and country. Archbishop Courtney received the pall in the great hall, May 4, 1382, and during his primacy a second chapel was erected, and the previous chapel was henceforth called "Capella Manerii de Croydon." Archbishop Arundel, his successor, lived much here, and is identified with the erection of the guard chamber; to Kentish antiquaries he is known as the Constable of Queenborough Castle, in the Isle of Sheppey, and a painting in the State dining hall at Lambeth is inscribed to this effect. In history, both secular and ecclesiastical, he played a great part as Lord High Chancellor of England during the reign of Henry IV., and also in the severe measures he took against the Lollards, of which Sir John Oldcastle (Lord Cobham) suffered in the cause. Chichele, who held the primacy for twenty-nine years, was much at Croydon; he is known as the founder of All Souls' College, Oxford, also as having built the great hall and the Lollards' tower at Lambeth Palace. To him belongs the honour of giving towards the parish church of Croydon, and of completing the work of that fabric which Archbishop Courtney began.

Archbishop Stafford is indelibly associated with Croydon, for he repaired and beautified, if not entirely rebuilt, the great hall, where his coats-of-arms remain in silent witness to the work he accomplished. Archbishop Bouchier, who held the see for thirty-three years, made Croydon one of his chief residences. He is identified by Kentish historians as having built portions of his famous house at Knole, near Sevenoaks.

Cardinal Archbishop Morton next comes before us, of exceeding fame as primate, statesman, and, I may say, architect, for he built the gate tower of Lambeth Palace, a structure of much power and beauty. As Bishop of Ely, he lived at Ely House, in Holborn, where remains to this day a chapel of extreme grace and an example of the Early Decorated style of architecture.

This cardinal lived through most eventful times. During the Wars of the Roses he was made Lord Chancellor, and in 1486 Archbishop, thus having filled the two highest offices in Church and State.

Archbishop Warham, that accomplished scholar and prelate, so well known in history, was Lord Chancellor to Henry VII., and only found his power eclipsed by that of his rival, Wolsey, who obtained the Great Seal in 1515. His residence at Croydon appears to have been brief.

Archbishop Cranmer, his successor, sometimes lived here, as his arms emblazoned in the south-east window of the guard-room would testify. His career and martyrdom are matters of history known to all of you.

We now come to a group of prelates—viz., Parker, Grindal, Whitgift, Abbot, and Laud, all of whom made Croydon their abode, the greatest fame resting with the three Elizabethan primates, whose entertainments of their Queen in the grand old hall adjoining was a mixture of courtly splendour and historic pageant. Archbishop Whitgift, whose hospital in this town, built by him, tells the tale of his love for this place, was much here; and we now note that "Croydon House" was first called "Palace" in the acts of the dedication of the Holy Trinity or Whitgift's Hospital. His successor, Abbot, lived much and died here in 1633. Like his predecessor, he founded a hospital in his native place, Guildford, a building of much architectural beauty and detail. Of Laud's residence here, history records several interesting facts, and we learn from Heylin's "Life" that in 1635 "this prelate repaired the ruined windows in the chapel of his house at Croydon, where he spent the greatest part of his summers, and whither he retired at other times for ease and privacy."

In Lord Clarendon's "Life" it is stated, "the Archbishop used to spend as much time as he could get at his country house at Croydon." With the downfall of Laud, we must leave this palace for a time, and return to it re-invested with even greater interest, though its days for the residence of the archbishops were drawing to a close. Archbishop Sheldon retired to Croydon after the Great Plague of London in 1665. His name will live as founder of the Sheldonian Theatre at Oxford. Archbishops Tillotson and Tenison do not seem to have resided here, but Archbishop Wake displayed great fondness for the place. He rebuilt the long gallery, and a pane of glass formerly in that gallery was retained by him as a memento; this glass has the writing of Archbishop Laud upon it. Archbishop Herring repaired and improved his palace, and died here March 13, 1737. His successor, Archbishop Hutton, resided here in 1757, but after this time the palace became so dilapidated, that in 1780 the buildings were sold, and the primates henceforth resided at Addington Park.

We have seen that out of thirty archbishops from Peckham to

Hutton twenty-four of these lived at one time or other at this palace, and four of them died here—viz. Grindal, Abbot, Sheldon, and Herring.

If this palace is no longer the country home of these distinguished men; if no longer the official record or the friendly letter dates from "Croydon House," it can still boast of retaining most of the important parts of its architecture, those parts which we most earnestly desire to see preserved, and to retain a building which, in an almost unbroken series, has had the occupants of the ancient see of St. Augustine for its residents, and should also claim our utmost regard by its connection with the national Church of England, and generally with "the history of the English people."

As I have now rapidly noticed those archbishops who made Croydon Palace one of their principal abodes, I can better follow the order of the chief official proceedings, and note how many of them date from this place. These acts and documents begin with Archbishop Peckham, 1279, and continue with few exceptions to those of Archbishop Abbot. They are, as I before stated, chiefly found in the registers at Lambeth, though the Record Office, British Museum, &c., contains correspondence of the archbishops with noted men of the time. In the earliest (Peckham) register several entries occur, and among them a mandate of the Dean of Rochford for the excommunication of one Nicholas de Curtney. We then find correspondence with the Abbot of St. Augustine's and Christ Church, Canterbury; also records of ordinations, admissions to benefices, &c., all dated from Croydon. In Archbishop Winchelsey's register is an order dated 1298, for the assembling of the Convocation of Canterbury in time for Edward I.'s return from Flanders. In his successor's (Reynolds) register occur directions to all in the Deanery of Croydon to appear and swear obedience to the archbishop.

In 1326 the custody of the park at Croydon was conferred on the son of one Le Barber.

The register of Simon Sudbury has several noted entries, among them the first instance of a will proved at Croydon, October 17, 1375.

I may here observe that wills were anciently proved in the Archbishop's Court, and that these early wills often contained much curious information as to the disposition of property left to the Church, with many archaeological items.

Archbishop Courtney's register opens on a wider field of historical research, for we find more wills, and in 1382 the Act for the election and confirmation of Robert de Braybrook, Bishop of London. Among other wills is that of the rector of Harrow, in Middlesex; also of one Galfridus Colpeper, of West Peckham, in Kent; of Nicholas de Carew (1390), probably a branch of the Carews, of Beddington, and a long deed on the assignment of the manor of Waddon. In the register of Archbishop Arundel occurs an interesting will of one John Aldermarston in 1403, who gave to the erection of the tower of the parish church twenty bidentes—or two-year-old sheep—a mediæval custom of giving cattle in value instead of money.

In 1414, we read of a Commission to inquire into the various manors or houses of the archbishops which existed in Kent, Surrey, and Sussex, and which have been to-day so ably described by our vice-president, Mr. Leveson-Gower, F.S.A. It is impossible to follow each archbishop's register, as it brings to light some interesting fact connected with Croydon; and I hasten to that of Cranmer's, where it is recorded that John Fryth, the Smithfield martyr, appeared before that primate to answer for his opinions about transubstantiation.

Of Cardinal Pole, one Act only occurs, in reference to a license to restore the monastic buildings of Westminster Abbey to their former use. The Elizabethan era—if I may call it—of the archiepiscopate at Croydon witnessed alike pageants and retained many documents.

We have mentioned the great entertainments, and now can only notice a few of the important Acts dated at Croydon. In 1592 we read of orders for the oath of obedience to Her Majesty. In the State Papers occur the following: "Archbishop Grindal's constitution with his clergy towards the rebuilding of St. Paul's, and that the other bishops of the province do the same. 1568. The Queen's instructions for recommending Bishop Aylmer for London, and Grindal for York. Much correspondence between Archbishop Parker and Sir W. Cecil."

From and after the time of Archbishop Abbot, the official documents assume more of an epistolary character; there is, however, the account of the proclamation by King James I., known as the "Book of Sports," the purport of which was to allow games and recreations on Sundays. Archbishop Abbot resisted this Act, and forbade it to be read in his church at Croydon; in this he was supported by public opinion. Thus did Croydon appear on the arena of ecclesiastical politics.

The noted "Diary of Laud" refers to this palace: several letters of that primate are dated from here between 1635 and 1640.

The curtain falls for a time on our history, for the Civil War which devastated Lambeth Palace, equally touched Croydon, where the Parliamentary army was quartered, and when, I believe, several of the archives were lost or destroyed. With the Restoration (1660), and Juxon as primate, official and some informal

letters reappear, stamping this place with an historic and enduring fame. The correspondence of Dr. Ducarel with the archbishops and other noted men of the eighteenth century is one of many points of note and interest. In 1754, Archbishop Herring writes: "I love this old house and am desirous of amusing myself with the history of its buildings, for the house is not one but an aggregate of buildings of different tastes and ages." In 1757 Archbishop Herring writes from Croydon, thanking his librarian, Dr. Ducarel, for indexes made and for his attempt to recover the original "Diary of Laud," now at St. John's College, Oxford. With the advent of Archbishop Cornwallis, the documentary history of Croydon Palace ceases. That history ceases only in part, for the building and this sacred chapel which has witnessed many consecrations in bygone years remains to tell us that the past has a history, and that the conservation of buildings such as these which have figured in the annals of Church and State, is a duty left us to carry out. In a recent speech by Mr. James Bryce, M.P., he alludes to the preservation of buildings, to us the one object, as regards Croydon Palace. "We live in a time when the past is vanishing with unexampled rapidity. The rapid development of the means of communication, the enormous increase of wealth, the higher sense of and desire for comfort, and the mere ambition of persons to signalise themselves by great works, makes this the greatest building age the world has ever seen—greater, perhaps, than even the twelfth or thirteenth centuries. The result of this process is to extinguish everywhere the traces of the past. We seem, as we drift down the stream of time, to go with an ever-accelerating movement, and to see the ancient features of the landscape amongst which our ancestors lived receding faster and faster from us. We seem to be carried, even as respects the material surroundings among which our lives are passed, as well as in our political literature and ideas and social habits, further and further, faster and faster, into a new order of things. If this be so—and it is most so in England, because the growth of wealth and material prosperity has been greater in England than anywhere else—is it not a reason for clinging with the utmost tenacity and earnestness to whatever in the external world can help us to realise the past, and our historical continuity with it? The sense of this historical continuity is essential to the greatness of a nation as well as to the mental elevation of the individual. It enlarges our horizon, it purifies our minds, and it gives us a livelier sense of our debt to the past and our responsibility to the future. It even ennobles the details of our political and social life when we feel they do not stand alone by themselves; that they are the outcome of the past, and are full of meaning and significance for the future."

New Church for the Old Meeting Trustees, Birmingham.

SIR,—I observe a friendly little paragraph in "Notes and Comments" of your last week's issue concluding with these words: "The case shows that there are some advantages in withholding referee's reports."

In this case it was distinctly understood that the report was to be regarded as a private communication, although the trustees, being a rather numerous body, printed it for their own convenience, adding in large type the following paragraph at the head of the report:—

"This report is printed for the convenience and exclusive information of each member of the trust, and should be regarded as strictly private and confidential."

A copy of the report would seem by some inadvertence to have fallen into the hands of my critics, how, I am quite at a loss to surmise; but under the circumstances the subject does not admit of discussion, the trustees having at once confirmed my award.

The position of assessor would become intolerable if every disappointed competitor is to consider himself entitled to challenge the award, and to discuss it in detail.

I am, Sir, yours obediently,

THOS. WORTHINGTON.

LEGAL.

High Court of Justice (Queen's Bench Division), April 30.

(Before Mr. Justice GROVE and Mr. Justice A. L. SMITH.)

CONTRACTOR'S LIABILITY FOR ACCIDENTS.

BACHELOR v. FORTESCUE.

This case raised a question of some importance as to the liability of contractors to mere bystanders for accidents arising from some defect in their machinery. It was an action under Lord Campbell's Act to recover compensation for the death of Henry Batchelor. The facts of the case were as follows: One Hiney was possessed of a plot of land in Bethnal Green Road, on

a portion of which land warehouses had been erected, and on the residue excavations were being carried on by the defendant, who had contracted with Hiney for the work. To carry out the work he, by his men, worked a steam winch and crane, with a chain and iron tub attached to it—the winch and crane being on the upper edge of the land which was immediately contiguous to the excavation. The mode of working was this: the iron tub was filled with earth, weighing about 15 cwt.; the steam winch then hoisted up the tub to the level of the ground, and the crane then swung it round to where a cart was waiting to receive the earth, and into which the contents of the tub were emptied. The machinery was the defendant's property. The evidence on the part of the plaintiff proved that the deceased was employed by Hiney to watch the materials and buildings belonging to him; and on Good Friday, the day of the accident, the deceased was watching the defendant's men at their work. He had nothing to do with the excavations, and he need not have been where he was to watch the buildings and materials; but he stood and allowed the iron tub with the earth in it to travel some 3 feet over his head, when the chain (which was somewhat worn) broke, and the tub and its contents fell upon the foot of the deceased, and caused injuries from which he afterwards died. Mr. Justice Lopes directed a non-suit, and there was an application by way of appeal from his decision. Mr. Baron Pollock and Mr. Justice Manisty granted the rule *nisi*. The case had been argued at some length during the last sittings before Mr. Justice Grove and Mr. Justice Lopes, and the Court had taken time to consider their judgment.

Mr. Justice A. L. Smith now delivered a written judgment in favour of the defendant. He said, it was conceded upon the argument that the deceased had nothing whatever to do with the defendant's men, nor was it any part of his duty to superintend or watch them at their work. We are of opinion that there was no evidence given to show that the plaintiff was other than a mere licensee (even if his case could be put as high as that) at the spot where he was at the time of the accident, and that he stood where he did subject to all the risks attending his being where he was; and that there was no duty cast upon the defendant to take due care of him. The cause of action alleged was that the defendant knowingly permitted a chain to be used which was unfit for use, but of this there was no evidence, nor was there any evidence of any duty incumbent on the defendant to take care to prevent danger to the deceased. There was slight evidence of negligence on the part of the defendant's men, in that the chain was somewhat worn, but as there was no duty on the defendant to take due care, the learned Judge was not wrong in directing a nonsuit, and therefore the judgment entered by him for the defendant must stand, and this application must be discharged.

CHURCH BUILDING AND RESTORATION.

Blackburn.—St. Alban's Church was reopened on Sunday last by the Bishop of Salford, after undergoing extensive additions. The new portion comprises a façade and central tower, a turret staircase being placed on one side, which leads to the ringing-chamber and belfry, which will accommodate ten bells. On the west side of tower is the main entrance and baptistry, and on the opposite side a corresponding space is arranged with open benches. The gallery floor is approached from the tower, and is arranged throughout with open benches; the additional accommodation acquired being 222 sittings. The façade is designed in a Romanesque style of architecture, with deep moulded strings and cornice table. The windows have shafts, the heads being circular, with wood moulds over. The internal fittings are of pitch pine, the floor being laid with tiles. The work has been carried out by local tradesmen, under the supervision of Mr. William S. Varley, F.R.I.B.A., Blackburn.

Elland.—A Congregational chapel erected from the designs of Messrs. John Kirk & Sons, architects, Huddersfield and Dewsbury, has been opened. The total cost, with alterations to adjoining premises, has been 4,500*l*. The contractors were: Mr. Pickles, mason, Luddendenfoot; Messrs. Halstead Bros., joiners, Eastwood; Mr. Aspinall, plumber, Elland; Mr. Hutchinson, plasterer, Elland; Mr. J. H. Stuttard, painter, Huddersfield; and Messrs. Pycock & Sons, blue slaters, Leeds.

Great Melton.—The church of St. Mary has been reconstructed from the designs of Mr. J. B. Pearce, of Norwich. The ruined church of All Saints was dismantled in 1710, and St. Mary's, which served the two parishes, was allowed to fall into decay. Projects for restoring it were made from time to time, but it was at last determined to demolish it and reinstate the earlier and better building, of which the tower and considerable portions of the walls were still standing, and in good condition.

Holbeck.—A Unitarian chapel, erected from the designs of Mr. J. Wreghitt Connon, of Leeds, has been opened. The works have been carried out by the following contractors: Mason, Charles Myers; joiner, J. H. Thorp; plumber, Joe Lindley; slater, J. Leeson; plasterer, T. Ripley; painters, Jackson & Co.; wood block paviors, Wharam & Co.; heating, &c., J. Constantine.

Dawley.—At a meeting of the committee lately held it was decided, on the proposition of the vicar, that, in addition to the parish church being thoroughly renovated and improved, the south porch be reopened and made into a baptistery, and the old Norman font be placed there. The architect to carry out the work is Mr. Fleeming, diocesan surveyor, Wolverhampton, and the contractor is Mr. James Rushton, of Dawley. Mr. Pointon, of Wellington, does the painting and decoration work; Messrs. Attwood & Sons, of Stourbridge, are placing the new hot-water apparatus in the church.

North Newton.—A new chancel and vicarage-house to St. Peter's Church, North Newton, Somerset, have been erected. Plans for the complete restoration of the church have been prepared by Mr. Harbottle, architect, Exeter, the tower being the only sound portion of the edifice. The interior oak fittings, which are of perfect seventeenth-century work, will be reinstated in the new nave. The old church consists of nave (rectangular on plan without a break) and a western tower. The ceiling is of semicircular form, ribbed and moulded in plaster, with a frieze of angels and festoons on the walls and numerous quaint figures, dating from 1635. The ancient windows are of oak-moulded frames. The old oak rood-screen contains figures of the Virgin Mary with the Infant Jesus, and Faith, Hope, and Charity. The pulpit is of moulded oak, and the small carved font and lectern are also of oak. The bench-ends are elaborately carved and moulded, and the west entrance door contains traceried panels filled in with carvings illustrating the parable of the wise and foolish virgins. The communion plate, a beautiful specimen of the workmanship of the time, bears the date 1637. It would seem that there was a church here in 1176 A.D., which in the sixteenth century was allowed to fall into ruins, and remained so until 1635, when the present church was built by Sir Thomas Wrothe. A new vicarage has been erected at a cost of 2,000*l.*, and a new chancel has just been built, the whole of the cost of the latter having been raised by the vicar. The chancel is a simple structure, built of rich red sandstone and covered with red tiles; the windows and arches are of Hamhill stone, and the floor is of plain red Maws' tiles. There are three stained-glass windows. The contract for the vicarage, as well as the chancel, has been carried out by Mr. Pratt, of Clyst St. Mary. A carved reredos of Beer stone with inlaid marble cross has been executed by Mr. Algar, carver, of Exeter.

Sheerness.—The rebuilding of the Sheerness Dockyard Church, which was destroyed by fire in 1881, is to be proceeded with from plans by Mr. C. E. Bernays. The work will be carried out by Messrs. Foord, of Rochester, and the cost is estimated at between 4,000*l.* and 5,000*l.*

Southwick.—The question of repairs, and also reseating with open benches, the ancient parish church of Southwick, Sussex, came up for discussion before the public vestry meeting last week when the report, plans, and estimates of the architect, Mr. Arthur Loader, of 54 Old Steine, Brighton, were submitted. The plans showed improved accommodation, and the estimates were for either oak, pitch pine, or deal. It was decided that a good subscription list should be obtained before commencing this work, or the lych gate in oak, designs for which had also been prepared by Mr. Loader.

Winslow.—At a public meeting last week, presided over by the Vicar of Winslow, it was decided to appoint Mr. John Oldrid Scott, architect, for the restoration of the church. Subscriptions amounting to over 1,000*l.* have been promised towards the cost of the work.

SCHOOL BUILDINGS.

Bolton.—A new Church school is to be erected on land near the junction of Radcliffe Road with Bury New Road. Accommodation will be provided for 364 scholars—viz., in the mixed department and four class-rooms, 210; and in the infants' department 154. The school will be built in Queen Anne style, of brick, with terra-cotta facings and ornamentations. The architects are Mr. W. H. Powell, of London, and Mr. Simpson, Acresfield, Bolton, and their estimate of the cost is 3,000*l.*

Bowdon.—New schools in connection with the Wesleyan Chapel were opened on Tuesday. The cost is about 1,700*l.* The buildings have been erected from the designs of Messrs. Potts, Pickup, & Dixon, architects, Manchester and Oldham.

Sowerby Bridge.—A Wesleyan Sunday school has been opened at Bolton Brow. The architect of the building is Mr. C. F. L. Horsfall, of Halifax. The contractors were: Masonry, Mr. J. Turner, Warley; joiners' work, Messrs. Halstead Bros., Eastwood; plumbing, Messrs. Fox & Sons, Sowerby Bridge; plastering and slating, Mr. G. Hoyle, Triangle; painting, Messrs. C. Whitehead & Co., Sowerby Bridge.

Bromsgrove.—New parish-room and Sunday schools for the parish of All Saints were opened on April 30. The schools provide accommodation for about 200 children, and are built upon a site nearly opposite All Saints' Church, presented by Mrs. Day, of Davenall House, Bromsgrove. The principal front is south-east, and is divided by buttresses into five bays, in the centre of which

are large windows, the middle one having three lancet-headed lights and a gable over, breaking the roof line. Two similar windows are also placed at a high level in the main gable ends of room. The walls are built with brick, relieved by bands, string-courses, and ornamental brickwork; and Bath stone is introduced in connection with window dressings. The roof is covered with Broomhall patent tiling, and in the centre is placed a bell-cot, which is covered with oak shingle, and surmounted by an ornamental vane. The schoolroom is of pleasing appearance, well lighted and ventilated, and is a nicely proportioned room, being 68 feet 6 inches long by 30 feet wide, and 27 feet from floor to ridge. The roof is an open one, being ceiled to under side of rafters, and has four principals, with curtain rods and rings attached for dividing the room into sections for classes by means of curtains. The exposed internal woodwork is varnished, and the walls are coloured. Fresh air is admitted by vertical flues, and extracting shafts are provided for vitiated air; also a large portion of each window is made to open. The room is warmed by two Manchester grates, which are of great heating power, as they utilise the back or waste heat, and materially assist ventilation of room by drawing in a continuous current of fresh air, which is heated to a considerable temperature when fires are in use. The offices and coal store are placed in the rear. The drains are laid with glazed socket-jointed pipes, and the playground is covered with gravel. The site is enclosed with brick walls, two of which are surmounted with ornamental wrought-iron fencing. School fittings are provided for, and the whole work is executed in a substantial and workmanlike manner by the contractors, Messrs. Brazier & Weaver, of Bromsgrove, from the designs and under the superintendence of Mr. Ernest Day, architect, of Worcester. The cost of works, including offices, fences, and school fittings, has been about 3*l.* 10*s.* per child.

NEW BUILDINGS.

Dundee.—New buildings at the corner of Commercial Street and Albert Square for the Northern Assurance Company have been completed. The architects are Messrs. James MacLaren & Son, of Dundee. The principal contractors were: For piling, Messrs. W. & R. Brownlee; mason, Mr. R. Laing; joiner, Mr. R. Lickely; slaters, Messrs. Laburn & Lindsay; plumber, Mr. D. Brown; plaster work, Mr. A. McRitchie; painting, Mr. J. Christie. The stone carving was done by Mr. Alexander Neilson, Edinburgh, and the external granite work supplied by Mr. G. Leslie Jamieson, Aberdeen. The chimneypieces were from Mr. G. H. Sizer, of Newcastle-on-Tyne, and Messrs. Field and Allan, of Edinburgh, who were contractors also for the enamelled tile work, the marble mosaic being by Mr. James Neilson, Carlisle; Messrs. Gray & Dickson supplied the grates, and Messrs. John Bryden & Sons the blinds; Messrs. Westwood, Sons, & Millar were the bellhangers; Milners' Safe Company furnished the doors and fittings for the safes and strong-rooms throughout the building; and the ornamental iron and brass work was by Messrs. Hart, Son, Peard & Co., of Birmingham. Mr. John Miller acted as clerk of works. The cost has been about 9,500*l.*

Ravensthorpe.—The foundation-stone of new stores for the Self Help Co-operative Society, Ravensthorpe, has been laid. The contractors are: Masons, Messrs. C. Whitehead & Sons; joiners, Messrs. Fothergill & Schofield; plumber, Mr. E. Walker; slater, Mr. J. Thornton; plasterers, Messrs. Grange & Cookson; painter, Mr. C. Ledgard; and ironfounders, Messrs. Marsden & Co. The work will be carried out under the supervision of Messrs. Kirk & Sons, of Huddersfield and Dewsbury, the architects.

Rochester.—A movement being on foot for the enlargement of the New Corn Exchange, the Corporation have obtained plans from Messrs. Flockton & Abbott, of an enlargement providing additional accommodation for 500, besides provision for a permanent platform, orchestra, organ, and an additional exit. At a committee meeting, it was decided to recommend the Corporation to carry out the work as soon as possible.

Rochester.—A new infectious hospital for Chatham and Rochester has been opened. The architect of the building is Mr. G. J. Shipper, of Norwich. The walls are built of Burham wire-drawn white bricks laid in Portland cement for facings, and the roofs are covered with slates. The works have been carried out by Messrs. J. G. Naylar & Sons, Mr. G. Hampton acting as clerk of works. The cost has been about 7,000*l.*

Birmingham Architectural Association.—An ordinary meeting of this association was held at Queen's College on Tuesday evening last. The vice-president, Mr. W. H. Kendrick, presided. Mr. A. T. Mansell was elected a member. An interesting lecture was delivered by Mr. A. Reading, A.R.I.B.A., on "Notes on a Sketching Tour from Heidelberg to Belgium." The subject was illustrated by limelight illustrations, and the lecturer was frequently applauded. A discussion followed, and a vote of thanks proposed by Mr. H. Clere, and supported by Messrs. J. P. Osborn, F. E. F. Bailey, T. Jones, Norman Gething, and Franklin Cross (hon. sec.), was accorded to the lecturer.

BECKENHAM—continued.

For the Erection of London and County Bank, Beckenham, Kent. Mr. W. G. BARTLETT, Architect.	
Cooper	£3,561 0 0
Shurmer	3,330 0 0

CLEVELAND WORKS.
PARIAN CEMENT. NINE ELMS BRAND.

MADE BY THE PECULIAR PATENT PROCESS.

Strongly Recommended, after 30 years' experience, for DAMP WALLS, on a backing of Portland, and as the ONLY SAFE CEMENT, capable of being PAINTED and PAPERED within 24 HOURS.

LARGELY PREFERRED FOR HOSPITAL WALLS & CEILINGS, BEING NON-ABSORBENT & NON-EFFLORESCENT.

TESTIMONIAL.

37 NORFOLK STREET, STRAND, W.C. : April 9, 1880.

DEAR SIRS,—The Parian Cement which has been used extensively in St. Thomas's Hospital, and of which a large quantity was supplied by you, has given great satisfaction, and is, I believe, generally acknowledged to be the best material for lining the walls of hospital buildings. Its hard, smooth surface admits of being readily cleaned, which I need hardly say is of great importance.

Messrs. FRANCIS & Co.

I am, Dear Sirs, yours faithfully,

HENRY CURREY, ARCHITECT.

Sole Manufacturers:—FRANCIS AND CO., VAUXHALL, LONDON, S.E.

The Architect.

NEXT YEAR'S PRIZES AT THE INSTITUTE.

AMONGST the various aims of the Institute of Architects, perhaps the one that must always awaken the greatest sympathy is the promotion of professional culture in the young. The same may of course be said of many other similar institutions not in themselves directly educational, but indirectly so in this way; and it need scarcely be added that the

mode of encouragement in almost all cases is the bestowal of prizes in acknowledgment of merit in competitive work. There is a notable distinction, moreover, which becomes apparent, in respect of this purpose, between the school, as we may call it, and the guild. The Royal Academy, for instance, as compared with the architectural Institute, is a case in point. In the Academy the promotion of education is effected by the maintenance of classes for the specific instruction of students of art. The prizes, accordingly, are certain academical rewards which are assigned to the best scholars in an appointed curriculum; and, amongst the rest, there is a very handsome prize appropriated to architecture in the form of a gold medal and a travelling scholarship of 100*l.* in value combined. But the Institute of Architects is not an educational establishment; it maintains no classes for instruction; it has not a single professor or lecturer of any sort, even nominally attached to its operations. But its prizes may be only all the more numerous and important. In a word, it takes the student where the Academy leaves him—when he is no longer a scholar in a school of drawing or design, but a student, or even a practitioner, in the practical work of business—and he is invited to present examples of such work for the criticism of judges who are thorough men of business and nothing else for the moment. The effect of all this is that the scheme of the Institute prizes for any one year is intended to be, and in some form or other always is, representative of the whole field of architectural practice, provocative of exertion in all its departments equally, and largely productive, not only of excellent intellectual results all round, but of such honour to those who deserve it as shall be a useful distinction to them in after-life. This is not the first time that we have spoken of these Institute prizes in *The Architect*, and we feel that it is desirable even to offer periodically fresh observations on the subject, both for the information of the classes of persons chiefly concerned, and no less for the consideration of the profession at large, in whose name the encouragement is afforded and the rewards are bestowed.

The first place amongst the Institute prizes in point of popularity is assigned by some to the SOANE Medallion, and by others to the PUGIN Travelling Studentship. Both are in reality travelling studentships, and of the same value—50*l.*; but in the one case there is a gold medal which goes with the money—or rather carries the money with it—and in the other there is a special prestige which is peculiarly attractive to the young, because the PUGIN work is generally, so far as work goes, of higher character than the SOANE. It may also be said with a certain significance that a PUGIN scholar might any day expect to win the SOANE medal with ease if the subject happened to admit of it, whilst any ordinary SOANE medallist might be nowhere at all for the PUGIN Scholarship, even if he were a Gothic man, as he seldom is, rather than a Classic. In other words, the SOANE prize has often gone to very questionable Classic work, but the PUGIN never to anything but the best of Gothic. At any rate, following this first pair of prizes, we have other two which may be regarded as a pair likewise—namely, the TITE prize (30*l.*) and the GODWIN Bursary (40*l.*). Neither of these can be called highly popular so much as highly useful. The one, founded by Sir WILLIAM TITE a good many years ago, has somehow been unlucky from the beginning; the other, established by Mr. GEORGE GODWIN quite recently, has a speciality about its purpose which places it apart. Next in order we may put Mr. GRISSELL's gold medal, which is also peculiar; it goes for construction pure and simple. Lastly, come two "Institute medals;" they are silver medals, which carry with them money

rewards of ten guineas, and one of them is devoted to drawings of interesting examples of English architecture, more or less ancient, while the other is offered for written essays on given subjects. We ought to state also that supplementary prizes are very generally added to the above, in the form of consolation medals and certificates, which are awarded to such competitors as come in second, or even third, in certain of the contests. The scheme as a whole, therefore, and none the less in detail, is a very good one, and, if carefully administered, one that ought to produce good results amongst the younger members of the profession at large, as well as good specimens of work from the competitors who come forward from year to year as representatives of their order.

To come now to particulars with reference to the current year, we find from the programme recently published that the SOANE prize is appropriated to the subject of a "Theological College." Perhaps we are right in supposing that this is intended to produce Gothic designs only; although, as we have hinted, the more usual course is to select a Classic problem. Last year the subject chosen was a "West End Clubhouse," and we might have been equally right in supposing that Classic work alone was invited then. But on that occasion—as will be remembered by many of our readers with a variety of sensations—the place of honour was, so to speak, assailed with violence and carried by storm with a design which was not only Gothic, but Gothic admittedly of the most demonstrative type. On the present occasion we cannot, however, advise competitors to try demonstrative Classic. No doubt there are "theological colleges"—there is one, for example, in the Regent's Park, London—whose architecture is Classic by accident; but English theology properly so called, or the theology of the English Church, is at the present time so completely identified with mediæval art that we scarcely hope to see anything else but Mediævalism in this case, and, indeed, scarcely wish to see anything else, even from those who may regard Gothicism now as a setting sun. Not even Queen Anne work—we beg pardon, it would be vain to deny that we *do* expect to see one or more Queen Anne designs; and we shall know what to say of them when we see them, for we begin to feel that we are on delicate ground. The 50*l.*, we may observe, goes towards the expenses of a six months' Continental tour.

The PUGIN Travelling Studentship is to be awarded, according to invariable custom, to the applicant or candidate whose "drawings and sketches" seem to be most promising in respect of "the promotion of the study of the Mediæval architecture of Great Britain and Ireland"; and the 50*l.* in this case is to spent by the successful student (who, by-the-by, may be "of whatever nation" the fates have happened to decree) in performing a sketching tour of two months or more within the limits of the United Kingdom. Such is the marvellous excellence acquired of late years by Gothic sketchers, that we have no doubt the PUGIN student for the coming year, and for many others to come, will do more than credit to the excellent object of the foundation; and no more need be said.

The GODWIN Bursary, which is "founded for the promotion of the study of works of modern architecture abroad," is appropriated on the same plan as the PUGIN Scholarship, by the selection of such one of the candidates as appears to promise most for the cause in view, having regard to his "drawings and sketches," with testimonials in this case, and a definite statement of what "place or places he undertakes to visit." The 40*l.* represents the cost of "a visit of not less than five weeks' duration to some part of Europe (other than Great Britain and Ireland) or America, specially to study, examine, and report on some of the best specimens" of plan, construction, or sanitation; a most admirable practical scheme, to which, if only because it is less attractive to the ordinary run of students, we wish all the more success.

Sir WILLIAM TITE'S 30*l.* is appropriated to the best design for "the Entrance Hall and Staircase of a Royal Palace," of course in the Italian style; a commonplace academical subject which is easily treated, and may be just as easily spoiled. But why should not some one come forward, and take the money creditably?

The gold medal left by Mr. GRISSELL is on this occasion to be awarded to the author of the best design for "the central hall of a fruit and vegetable market" in iron construction. This is a good subject, and one that ought to bring out both good science and good art.

The "Institute" medal competition of drawings has for its subject, as usual, the illustration of "any important building, Classical or Mediæval, in the United Kingdom or abroad, hitherto unpublished;" but it is suggested that some town or country house should be taken this year, and nothing could be better.

For the similar competition of essays, the subject appointed is "Staircases"; not surely the best for a literary effort of this order, unless some writer should take a very wide view of the question artistically, in which case he may write half a dozen "essays" on the subject, and still leave much to be said.

Leaving the matter now in the hands of our readers, with a strong recommendation to make the best of the opportunity in all departments alike, we desire to direct particular attention to the mistake generally made in supposing that the more youthful classes of students are alone intended to take part in these contests. Perhaps it must always be the case that young men will come forward most readily, but let the restrictions as to age be at any rate understood. For the PUGIN studentship the age of applicants must be between 18 and 25; but for the SOANE medallion it is extended to 30, and for the TITE prize also to 30; for the GRISSELL medal the limit is ten years from commencing independent practice; and the GODWIN Bursary and both the Institute medals are open to candidates of any age. We will only add that the conditions of contest in detail are to be procured at the Institute Rooms in Conduit Street; although it has to be acknowledged—for there is no human blessing without its little drawback somewhere—that the document has to be purchased by non-members at the scarcely magnanimous price of "3d., by post 4d." We hope that the Council will see their way some day to sacrifice both the pence and the postages in the obvious interest of the dignity of the cause.

ARCHITECTURAL DRAWINGS AT THE ROYAL ACADEMY.

WE cannot speak with enthusiasm of the collection of architectural drawings which form part of this year's exhibition at Burlington House. Rather less space than has been customary is allotted to them; but, notwithstanding this curtailment, one hundred and twenty-three drawings of one sort and another have been brought together. Such a number, even after an ample deduction of works which cannot well be refused, but which contribute little or nothing to the illustration of the architectural work of the year, would afford room for the display of a great deal of genius, enterprise, and originality if it existed; but we confess that these qualities are scarce, and that neither in the excellence of the draughtsmanship, the merit of the designs, or the importance of the subjects illustrated, does the present exhibition equal some of those of past years.

An attempt has been made more definitely than has been usual to form a distinct "line" in this room, or, in other words, to select the best drawings, and hang them exactly level with the eye; but this is combined with the old custom of marking the centre of each wall by placing in it a group of prominent works. The head of the room is occupied by a drawing by Mr. WATERHOUSE, A.R.A., while the central place on the side wall has been given to a drawing contributed by an architect outside the Academy, which, strange to say, does not exactly represent architecture, and embodies a design that has not been carried out and is not intended to be; we allude to a very clever design for an organ by Mr. H. W. BREWER. Everyone knows Mr. BREWER's great merits as an architectural artist, and none will grudge him this honour; but it certainly seems open to question whether some work of architecture proper ought not to have obtained the distinction implied in this prominent position.

Mr. WATERHOUSE's drawing (1,156) represents a proposed extension of Owens College, Manchester. It is a comparatively small coloured view of a large block of buildings, of which two fronts are seen. This work is hardly so happy as Mr. WATERHOUSE's designs usually are; the mass occupying the angle nearest the spectator is a little heavy and a little confused, but the parts further from the eye are more successful. The front to the spectator's left is well broken up by buttresses, and its centre is marked by a picturesque low tower with angle turrets; the tower is crowned by a steep roof, and the turrets

with their pyramidal caps are very well managed. The tinting of the drawing looks as if some kind of brick or reddish stone were intended. Immediately below hangs a contribution by Messrs. ERNEST GEORGE & PETO, who are this year exhibitors of four works. Stoodleigh Court (1,155) represents a large mansion, treated in the manner of a seventeenth-century manor-house. The plan shows that the usual rooms of a modern dwelling-house are grouped round a large hall with bay-windows, and approached by a projecting porch. The view represents the entrance-side of the house, to which the air of a quadrangle is given by the help of a long projecting wing and some enclosing walls. The buildings are partly half-timbered and partly not, and an old-world air has been given to the sketch, which is slightly tinted, partly by the character of the architecture, but partly also by the artifice of introducing into the foreground a little of that disorder which no English country squire would tolerate near a newly-built house. The whole is too thoroughly a revival of antiquated work to seem quite in keeping with modern requirements.

Two drawings in pen and ink, but apparently by two different hands, are exhibited by Mr. JAMES BROOKS (1,157, 1,153). They represent different views of the exterior of the church of St. Peter, at St. Leonards-on-Sea. This is a church with nave and aisles, transepts, and a central fleche rising out of an unpleasing gabled high roof over the crossing. The less successful of the two drawings represents the west front. The nave is lofty, with a very high clerestory; the transept has square, strong-looking turrets, which fortify the angles and help to make with the gable a fine group. The east end, drawn very pleasingly, represents the gable of the chancel, which is not apsidal but square-ended. The east window is a group of lancet lights, and the gable is flanked by turrets. These with the aisles, and behind them the transept, make a noble group, to which the crowning feature is unfortunately inadequate. We can only hope that this part of a very fine design may be reconsidered before the building is completed.

Mr. JOHN L. PEARSON, R.A., exhibits a view of the exterior of St. Stephen's Church, Bournemouth (1,161). The drawing is intended to show the west front, and only gives a slight indication of the side of the church. The west gable is occupied by a large and prominent window, and is flanked by a tall and massive tower, surmounted by a very lofty spire. The belfry stage in this tower is very marked, and forms a principal feature in the composition. Below the window is a small west door, so small indeed as to be somewhat detrimental to the effect of the whole. The church has transepts and a lofty clerestory, and, in fact, there is no feature in it which has not been used again and again by church builders ancient and modern. Yet the design is full of originality and of dignity, and well sustains the high reputation of the architect. This is Mr. PEARSON's only contribution to this exhibition.

Mr. AITCHISON, A.R.A., exhibits a design (1,166) for roofing over the central quadrangle of the Royal Exchange. In this the forms of iron construction are frankly accepted—that is to say, wrought-iron girders are thrown across the space, the web being pierced at intervals by apertures so arranged as to form an ornamental pattern, and the spaces between the girders are occupied by a ceiling which appears intended to be executed in glass in light iron frames. The whole of this structure is, however, raised some feet above the crowning member of the architecture of the quadrangle, and a kind of clerestory filled with glass in iron frames is thus formed. This is hardly so successfully treated as the roof itself, which is undoubtedly at once simple, very appropriate, and pleasing. The same architect also exhibits (1,145, 1,146) part of the decoration of a house in Chesterfield Gardens. In both the drawings the colour chiefly employed is a kind of Venetian red with black woodwork. A deep frieze, with marine subjects, such as dolphins and tritons, occupies the upper part of each room, and the general result is an appearance of great richness obtained by comparatively simple means. We shall have to notice two other contributions by this architect later on.

Turning now to the group of drawings which are hung prominently on the side wall, we begin with the design for an organ (1,210) by Mr. H. W. BREWER, already alluded to in our opening remarks. The instrument is supposed to stand in something like an enormous rood-loft over a richly-moulded semicircular arch, thrown across at the point where the chancel arch ordinarily spans a church. The interior of a roomy lofty

nave is shown, and through the arch we see the lower part of an apsidal chancel, while above the organ a part of the groined roof is visible. The organ itself is intricate in the extreme, but very striking in its appearance, showing immense command of the resources which the florid tabernacle work of late architecture, of a rather German type, places at the disposal of a designer familiar with it. Groups of pipes occur in every kind of position, all however contributing to the general effect of a rich, if somewhat extravagant, composition. It need hardly be said that the draughtsmanship shown is of a high order. Below this hangs a clear, telling pen-and-ink drawing by Mr. F. G. JACKSON (1,211), of Thorne House, near Yeovil. For some reason which the drawing does not make clear, the architect has preferred to make a bird's-eye view of his work; and thus for what is in all probability a well-marked sky line, as seen from below, is substituted a heavy series of roofs, not at all adding to the effect of what at best, though a good, sensible design, is in no way remarkable. Mr. E. J. MAY exhibits a very slightly-executed, but clever pen-and-ink drawing (1,213), representing a row of houses now erecting in Bedford Park. These are good specimens of that revival of English debased Renaissance which may without impropriety be called the Bedford Park style, for nowhere else, so far as we know, can so much of it be seen at one spot, or has it been carried out so uncomplainingly. The gables with barge boards, projecting bays, small square panes, narrow windows, and other features which go to make up the picturesque but rather incongruous group of buildings before us, have all been used before by Mr. NORMAN SHAW in the earlier buildings of this very estate; but we miss in Mr. MAY's work the master-hand that made an artistic whole out of irregular, unmanageable, and often clumsy features. Mr. E. R. ROBSON, the architect to the London School Board, exhibits (1,207) a London school. This is a busy building, with apparently a large central hall or schoolroom of two storeys, flanked by two blocks of many storeys. The style is much the same as Mr. ROBSON's many executed schools have made familiar to Londoners; but there are unusual features worth notice, especially the short sturdy turrets corbelled out from the angles of the hall. The same architect also exhibits (1,195) a first sketch for a school of the same type, if not the same building.

The only important municipal building of which drawings are exhibited is the very large one in course of erection at Glasgow from the designs of Mr. W. YOUNG, who, as our readers will remember, gained it in competition. Two elevations (1,204, 1,216) are exhibited, one showing the George Square front, and the other that facing George Street, but no key-plan. We confess that, after careful examination, the result is on the whole disappointing. There is no doubt considerable play of sky line, and a variety in the grouping of the features of the two fronts that is praiseworthy, but the architecture, especially in those storeys that are continuous, and from which the building will take its complexion, does not rise above the commonplace. The special features, the main central tower and the angle towers, are certainly the best-designed parts of the composition, but they fail to impart the refinement and freshness which they undoubtedly possess to the portions nearer the eye.

The main front shows a rusticated basement with pilasters introduced, and embracing two storeys of the building. Above this comes what must be regarded as the principal storey, with arched windows; and then under the central pediment and the two angle towers another storey is introduced. Behind the pediment rises a lofty central tower—the lower part quite plain, as it should be, and the upper part with three storeys of architectural features. The George Street elevation, which is rather the longer of the two, and is planted on sloping ground, is cleverly varied from the front. The fall in the ground is well dealt with, and the central block has no pediment, and in many respects presents a striking contrast to the centre of the main front. The order on the main floor is here worked in with a higher order, somewhat after the manner of PALLADIO. This has been adroitly done, and is not unsuccessful, but the experiment is a dangerous one. A great deal of sculpture is shown on the drawings, and we trust that this may not be omitted in execution (as is too often the case), for the effect of the building depends to no inconsiderable extent on its introduction. Nothing, however, is so important in a work of this kind as refinement of detail, coupled with the use of fine architectural features. As we have already hinted, many of the features are not as fine as they might be, but

there is no reason to fear that the detail will be other than refined.

We meet with Mr. ARCHERSON'S work once more, and this time it is the picturesque five-storeyed gabled front of a comparatively narrow street building (1,220), the Royal Exchange Assurance, 29 Pall Mall. The style is not easy to characterise. It is a version of late Renaissance, admitting mullions and transoms, baluster-shaped pilasters of a rather French type, broken gables which have a German flavour, and balconies that seem more English. The result, however, is happy, and though the openings are very large in proportion to the solids, we cannot say that this is a defect in such a climate as that of smoky London has now become. Near this drawing hangs a charming drawing of an excellent piece of Gothic architecture, in the shape of *An Enlargement of Bromley Church* (1,225), by Mr. T. G. JACKSON. A good square-ended chancel and a projection for a vestry, with apparently a muniment-room over, are intended. The upper part of this last building is very quaintly arcaded, and the whole group is successful.

Among the other drawings on the line in this part of the room is a singular group of four large gabled mansions for Harrington Gardens (1,201), by Messrs. ERNEST GEORGE & PETO. Each of these is a bulky, many-storeyed mass, with a vast gable of a character approaching Flemish work. The designs are certainly not wanting in daring, but there is an element of ungracefulness about all of them, the least unsatisfactory being the one furthest from the eye, of which only the flank is seen. There is a want of repose and an absence of grace about these buildings, which is not compensated for by a good deal of vigour and boldness. The next drawing is one of the contributions of Mr. NORMAN SHAW, R.A., and is probably the finest specimen of draughtsmanship on the walls; it represents (1,197) the chimney-piece in the picture gallery at Cragside, and shows a vast *cheminée* profusely enriched, and reaching to the top of a room with an arched ceiling. This projection is carried on short columns, and its surface is filled by florid Elizabethan scrolls and figures splendidly drawn, and showing that Mr. NORMAN SHAW has lost none of his vigour either as a designer of ornament or as a draughtsman unsurpassed in the use of the pen.

In a subsequent notice we shall have to pass in review other works by some of the exhibitors already named, and also contributions by many well-known architects; but we miss from the walls the work of several architects of note who are ordinarily exhibitors. We cannot help, also, remembering how constantly the contributions of Mr. STREET, and other architects no longer living, used to add a lustre to this display, and we are painfully reminded by their absence that architecture has within the last few years lost not a few of the artists whose works were most instinct with power of design and skill in meeting the requirements of modern life. The vacant places will not easily be supplied.

THE EXHIBITION OF THE WORKS OF THE FRENCH ACADEMY STUDENTS IN ROME.

[FROM A CORRESPONDENT.]

THE beautiful Villa Medici, which, from its delightful grounds on the Pincian Hill, overlooks the panorama of the whole of Rome, is well known to every visitor to the city. It is the residence of those fortunate French art students who have been able to gain the much-coveted studentship of Rome, consisting of a free residence there, together with a sufficient subsidy for their maintenance for a term of four years. Every year a public exhibition of their works is held previously to sending them to France. The exhibition of this year is now open for a few days. A short account of the works there submitted may not be uninteresting to your readers.

The exhibition of this year is perhaps not quite of average importance as to the number of original works and their artistic value, but it is nevertheless highly interesting as indicating the power and aims of those who, it is presumable, may become the inaugurators and directors of the next phase of development of the French school of painting and sculpture.

Whatever may be the imperfections of these high-class students' works from a closely-critical point of view, there is no question but that they are all lofty in intention, strong in technical workmanship, and generally broad and pictorial in

their main features. They are conscientious and thorough in academic qualities, and claim to be regarded with respect even when they are open to criticism.

To commence with the first room. M. PATEY sends a charming little circular relief in plaster, called *A Pastoral*. It represents a faun seated upon a rock playing upon reed pipes and at the same time taking a goat by the beard. The same artist has a refined head in low relief, *La Force*, for working in cameo. *The Apple of Discord*, by M. LABATUT, is a large model in high relief. MERCURY descends with the apple, which he places in the hand of the shepherd PARIS, who is seated, a dog resting his muzzle upon his lap. It is well conceived, and shows considerable powers of modelling; but the repose of the composition is destroyed by a violent twist given to the head of PARIS, who is looking upwards at the heavenly messenger. M. FOURNIER has some careful drawings on tinted paper from the museums of the Vatican and the Capitol. He has also an oil picture, *Orestes taking Refuge at the Altar of Apollo at Delphi*. The prince is represented clinging to the altar, upon which stands a symbolic figure of APOLLO. It is situated on an elevated plateau overlooking the city, and commands the distant mountains. A tripod is smoking in front of the image. ORESTES holds a dagger in his hand. There is a good deal of tragical expression in the face. The time chosen is that of early morning, the thin crescent moon and a few pale stars still visible. It is a work of considerable promise. M. DEBLOIS furnishes a careful steel engraving of the well-known group of *St. Catherine*, from the fresco of SODOMA in the church of St. Domenico, at Siena. M. SCHOMMER, who has the largest canvas here exhibited, has chosen for his subject *Editha Finding the Body of King Harold after the Battle of Hastings*. The main group is composed of three figures, EDITHA and two monks, in the arms of one of which EDITHA is fainting on recognising the body, blue and livid, at her feet, whilst the other looks pensively at the slain monarch. A horse contorted in the death struggle occupies the foreground. In the distance, men and horses are seen lying amidst a scene of ruin and confusion; black ravens flitting hither and thither, feasting on the carnage. The picture is simply constructed and thoughtfully studied. The drapery of the female figure is nevertheless not quite satisfactory. The French system of requiring students to work on a large scale is unquestionably a means of conferring power over the material and mastery of execution. M. BRAINTOT has a small picture—*Job and his Comforters*—well constructed, but slight in execution. His large copy of *A Group from Raphael's Fresco, Heliodorus*, in the Stanze of the Vatican is more satisfactory. It is robust and vigorous in execution. M. DOUCET in his *Ave Maria* has gained originality but, perhaps, not on the most judicious grounds. It represents "The Annunciation," the scene and accessories of which have been evidently studied at the Island of Capri. The MADONNA descends from the house in the early morning to meet a kneeling angel who brings the heavenly message. The MADONNA is dressed in white; pale, vague, and shadowy as a spirit, with a faint aureole round her head, whilst the angel—a young female figure—is substantially represented in a richly-coloured figured dress of Japanese semblance. The attempt to find a new point of view in a young artist is not altogether to be reprehended even if not absolutely successful, but such an attempt should come more from within than from without; that is to say, the freshness should be sought rather from the imaginative than the circumstantial element. M. DOUCET appears in this picture to have depended rather on the latter than the former. The Virgin is scarcely human or real at all. The form, too, is not well made out under the dress. M. PEYNOT exhibits a statue, *Pro Patria*. A boy lies dead with a gash in his forehead, holding a broken sword in his hand. It evidences great care and study. The head is especially fine, but there is a general want of the imaginative sentiment in it. It is too literal and prosaic. M. BULAND shows two very delicate drawings, done with crayon and the stump: the one from a picture of HOLBEIN in the Borghese collection, the other from the *Moses* of MICHAEL ANGELO. He has also another drawing, from which he gives an excellent engraving, of *La bella Simonetta* by BOTTICELLI.

The architectural drawings here exhibited are of the highest excellence. In quantity they are not so numerous as in former years, but nothing could be more complete and perfect in execution. They chiefly consist of restorations and quarter-size reductions of fragments of ancient architecture.

M. DEGLANE exhibits a fragment of *Entablature from the Forum*, also a part of the *Entablature of the Temple of Concord*, both restored and studied in detail with the utmost care. He also illustrates them with scale sectional drawings. M. BLAVETTE has reproduced the *Ceiling of the Grand Council Hall of the Doge's Palace, Venice*, rendered in colour with the PAUL VERONESE paintings. M. GIRAULT gives a coloured drawing of the *Tomb of Mastino II. of the Scala at Verona*, finely detailed with the wrought-ironwork by which it is inclosed. He also furnishes ground plans of the same. He has also two thoroughly-worked-out restorations: *An Entablature from the Temple of Castor and Pollux* and the *Capital of a Column* from the same temple, both highly praiseworthy for the beautiful manner in which they are executed.

SIR THOMAS TRESHAM AND HIS BUILDINGS.*

THE county of Northampton, at first thought, hardly suggests archaeological interest, but the land of "squires and spires," of fat pastures and fox-hunts, has somehow been as productive as most other shires to historians, antiquaries, and folk-lore collectors. The list of "rare and curious tracts" relating to the history of the county, which have been published by one firm, Messrs. Taylor & Son, of Northampton, fills eight folio columns. Then there is the elephantine work of Baker, which unhappily was never completed. Enough materials were found in Northamptonshire to enable John Bridges to compose a history which, in manuscript, fills thirty folio and eleven smaller-sized volumes, and he was far from exhausting the subject. The county being naturally fertile, would attract invaders in days when plenteous crops were preferred to the picturesque, and Romans, Saxons, and Normans have left their mark there. It was the scene of events which were of national importance, and the name of many an English worthy is associated with the county. Those men erected so many stately mansions it would seem that there was a sort of emulation among them in their patronage of architecture. Sir Christopher Hatton may be taken as a type of this spirit. When he was building Holdenby it was said that for the bravery of the buildings, the stateliness of the chambers, the rich furniture of the lodgings, the convenience of the offices, and for all other necessities appertaining to a palace of pleasure, Holdenby was incomparable, and without a fellow in England, always, of course, excepting one of the Queen's own palaces. The same spirit would appear to have animated Sir Thomas Tresham, a man who was in other respects unlike Hatton, for instead of being a courtier and successful politician he was a student and a mystic—one might even call him a confessor for his faith. He erected three buildings which have a peculiar interest, inasmuch as they may be said to have a personal character, and one of them is symbolic of Tresham himself, his family, and his religion. They have been heard of outside Northampton, but it was reserved for Mr. Gotch to prepare a series of beautiful and most careful drawings, by which the buildings are exhibited in all their interesting details. Too much praise could hardly be given to his work, which is a model of an architectural or archaeological monograph.

To understand the buildings, it is requisite to know something of Sir Thomas Tresham. He belonged to an old family, and an ancestor of his had been Attorney-General in the reign of Henry V. His grandfather was a zealous supporter of Queen Mary, who made him Prior of the Order of St. John of Jerusalem. Fuller characteristically describes the Prior: "He was of an ancient family and large estate, and had done the Queen knight's service, proclaiming her in the highest contest with Queen Jane. If the dimension of his body may be guessed by his finger, and his finger by his ring (which I have seen in possession of his kinsman, William Tresham, Esq., of Newton, in Northamptonshire), he was a little giant, and far greater than his portraiture on his monument (almost demolished) in Rushton Church, in the same county. But Alexander's soldiers were not in proportion so big as their shields left in India; and possibly that ring of state, serving for a seal, was rather borne about him than worn on his finger." On the Prior's death in 1559, his grand-

* *A Complete Account, illustrated by Measured Drawings, of the Buildings erected in Northamptonshire by Sir Thomas Tresham between the years 1575 and 1605.* By J. Alfred Gotch, Architect. Northampton: Taylor & Son. London: B. T. Batsford.

son, Thomas Tresham, then fifteen years of age, and a Protestant, succeeded to the estates. He was subsequently knighted by Queen Elizabeth when she visited Kenilworth. In 1580 he became a Roman Catholic, and, in consequence, had to suffer much during the remainder of his life. He was brought before the Star Chamber in the next year on a charge of harbouring Jesuits, when he defended his cause by quotations from the Early Fathers, and said that his principal study was Divinity. His theological knowledge did not serve him before his judges. He was fined and imprisoned; for twenty years he was mulcted in the large sum of 260*l.* per annum, and other fines were levied on him. But his payment did not secure his liberty, for he was often committed as a recusant, and was thus acquainted with the interiors of London and provincial prisons.

Before he was entangled in the doctrinal mazes of the sixteenth century, Sir Thomas resolved, like a true native of the county, to meddle in building and erect a market-house in Rothwell for the benefit of his neighbours. It was to be, likewise, a memorial of his friendship for certain families, and it was a worthier object than the urns which in the eighteenth century were dedicated to particular friendships by country gentlemen. John Thorpe was then engaged on some mansions in the county, and it is presumed that he prepared the plans for the market-hall, but unfortunately the building was never completed. In his examinations Tresham may have discovered that the people of Rothwell were not all his friends, and that the gift did not atone for his recusancy. The building is of two storeys, a market-hall and a public hall, the upper floor being reached by a circular staircase, which has been utilised as a lock-up. The hall is the playroom for the village children, but it ought, as Mr. Gotch suggests, to be converted into a public reading-room, if it were only to secure the preservation of the structure. The intention of the builder was expressed in a Latin inscription which runs around the four elevations on the frieze of the lower storey. "This," it recorded, "was the work of Thomas Tresham, Knight. He erected it as a tribute to his sweet fatherland and county of Northampton, but chiefly to this town, his near neighbour. Nothing but the common weal did he seek, nothing but the perpetual honour of his friends. He who puts an ill construction on this act is scarcely worthy so great a benefit." Around the upper frieze (which is made deep to hold them) and in the spandrels of the arches are ninety shields with the arms of families in the county and elsewhere. The principle on which they were selected is unknown, or why some shields are repeated. Mr. Gotch is surprised at the absence of the arms of kinsmen of Sir Thomas, who were also bound to him by the ties of a common religion. But when the lodge was designed it is probable that the knight was not a Catholic.

With the exception of the use of trefoils (which are taken from the family shield) as an adornment for the shafts of the pilasters of the staircase, the shields of his friends and the inscription which reveal the man's kindly nature, there is nothing in the Rothwell market-house which can be said to reflect the Tresham idiosyncrasy. But imprisonment and other punishments, which the practised ingenuity of the orthodox officials of those days could convert into slow martyrdom, had an effect upon him which is expressed in his next building, the triangular lodge at Rushton. The student of divinity and mystic lore could hardly fail to discover that there was something remarkable in his own name and in the devices which belonged to his family. What was Tresham but a testimony to the mystery which Pagans, Cabalists, and Christians beheld in the number three? and was not the trefoil with which his shield was charged consecrated as a symbol of one of the sublimities of the Christian religion? Thinking of these things, it is not to be wondered at if he resolved to erect a permanent memorial of his faith, and thus

"Three solemn parts together twine
In harmony's mysterious line."

If he had lived in the nineteenth century he would probably have contented himself with covering drawings of buildings and statues with triangles in order to exhibit the system on which they were based. The triangular structure at Rushton, which is called a lodge, exemplifies Tresham's mysticism. On plan it forms an equilateral triangle, each side being 33 feet 4 inches on the ground and 33 feet on the upper floor. According to one set of measurements, "each side of the building measures 33 feet 3 inches, and the height of the parapet is exactly that which the apex of a triangle would reach with equal sides of 33 feet 3 inches;" but Mr.

Gotch has not been able to agree with those figures. The interior is thus described:—

"There are three floors, each lighted by three windows on each of the three sides. Inside there is a hexagonal chamber on each floor, and of the triangular corners thus left one is devoted throughout to the corkscrew stairs, the other two to small rooms, except on the top floor, where one of these corners is apparently solid, and contains the only fireplace in the building. The floor of the basement is the bare earth, and but little light struggles in through the small triangular unglazed apertures. The construction of the floor over is here visible. It consists of a double set of joists, one for the ceiling, the other for the cement floor. Both the ground and the top floors are formed of cement. About the ground floor there is nothing remarkable; the entrance is extremely narrow, and there are ponderous means of securing the door in the shape of a stout bar running into the wall. In the north wall of the triangular room at the north-west corner is a small recess, of which the purpose is by no means apparent. This same corner room has its ceiling much lower than the others, the space over it being presumably occupied with vaulting to carry the fireplace and solid corner over; though it is possible that this apparently solid corner contains one of the hiding-places which became so numerous under Elizabeth's persecutions of the Roman Catholics. The chimney arises mysteriously from the middle of the building, and as there is no wall immediately beneath it, it becomes an interesting speculation as to how the chimney is carried, for the plain whitewashed ceiling of the top floor hides everything above it."

The exterior of the building is remarkable. The three windows on the three floors are in some way related to the number three; there are three triangular gables on each side with finials that end in a trefoil; the chimney has a triangular top ornamented with trefoils. The inscriptions are in Latin and are taken from the Bible; some are according to the version adopted in the Roman missal. Another peculiarity is the introduction of numbers. Over the door we find 5,555, and on the gables 3,898, 3,509, 1,641, 1,626, 1,595, 1,580. The building was erected in 1595, which date appears on each face of the chimney, together with religious symbols. The meaning of the other numbers has yet to be discovered. Care was taken by Sir Thomas Tresham to secure the association of his name with the building. His initials are in letters 4 feet deep, and shields with his arms, and some with those of his friends, are introduced around the principal windows. The value of the lodge as a piece of architecture is not great: it is in a mongrel style, partly Renaissance and partly Gothic, the details being without character. "Whatever may have been the motive of its author, the triangular lodge is now," says Mr. Gotch, "and must always have been, of very little practical use. It has indeed been used as a dwelling-house, but only as a makeshift, it having but one room with a fireplace. It must always have been a 'Folly,' an elegant, quaint, and expensive freak of its author; and therein lies its chief significance to us—on the light it throws on the manners and modes of thought of the age in which it was built."

In far better style than the market-house or the lodge is Lyveden New Building, but here again destiny appeared to be against Tresham, for the house was left unfinished. It was designed by John Thorpe, and his sketch plan is in the Soane Museum. The plan is a Greek cross. On ground floor are—north, waste hall; south, stairs; west, hall; and east, parlour; and on upper floor two bed-chambers and a great chamber. The windows are square-headed, and those at the extremities of the four arms are bay windows of the full height of the building, but, with one exception, they do not form part of the adjoining rooms. "Bay windows were not always," says Mr. Gotch, "carried up as they are here, the whole height of the building, with the main entablatures breaking round them, and it is an interesting speculation as to how the building generally, and the bays in particular, would have been roofed." The building, as an example of the time, is interesting, but the features which are most attractive to us are those which were evidently inspired by Sir Thomas Tresham. One is a series of shields running round the basement, and which, if fate had been propitious, were to be dedicated to friendship and the Treshams. The second is a fine cornice above the ground-floor windows, consisting of sacred emblems in the metopes between triglyphs. According to Mr. Gotch: "The details are singularly delicate in treatment, and in advance of any contemporary work. Nothing so refined is to be found either at Kirby (1570), Burghley, Montacute (1580), Longleat (1579), Holland House, Hatfield (1611), or Bleckling." The upper cornice contained Latin inscriptions.

Lyveden New Building apparently occupied the few years before his death which Sir Thomas Tresham spent at liberty, if that could be called liberty which was not unlike modern "police supervision." He died in September 1605, and was succeeded by his son, Francis Tresham, who had taken part in the insurrection of Essex, and was saved from execution by the judicious distribution of two or three thousand pounds among Elizabeth's favourites. Francis Tresham was on account of his wealth inveigled into the Gunpowder Plot, although Catesby was doubtful of his fidelity. He is supposed to have been author of the anonymous letter to Lord Mounteagle, which led to the frustration of the conspirators. He was arrested on November 12, and died in the Tower on December 23, 1605. His mother survived him, and, of the position of Lady Tresham, Mr. Gotch writes:—

"The New Building itself has always been a ruin, and must have been a melancholy sight to Lady Tresham, when she came to reside at Lyveden after the death of her husband, Sir Thomas, and the sad end of her eldest son. The softening hand of Time had not then covered it with kindly lichens, but every unfinished detail remained hard and gaunt as it was left in the day of calamity. The poor lady must have had a dreary time of it during those years. Her family shattered; her religion detested; one of her sons struggling for place in the debased Court of the first James, and married to a foreigner; the other fighting for mercenary pay in distant lands; and she herself annoyed with petty persecutions at the hands of local functionaries. It is with a sense of relief and pleasure that we learn how at last her letters to Lord Salisbury took effect, and she was released from the small tyrannies of John Lambe, Proctor of Northampton, who persisted in inditing her for recusancy, although she was paying the usual penalties; and how in gratitude she offered his lordship half a hundred fruit-trees to plant at Hatfield."

The Tresham property changed ownership in the course of half a century. It was purchased by Sir William Cockayne; but so long as the walls remain of the three buildings described by Mr. Gotch there will be a memorial of Tresham, as well as of the vicissitudes of an ancient family.

SCHADOW'S "POLYCLETUS."*

THE importance of a standard of proportion for the human figure is shown by the numerous attempts of ancient and modern artists to formulate a canon. In Egypt the proportions were generally fixed, as is evident not only from the figures but from the series of ruled squares which were found in the tombs at Thebes and elsewhere. There was more freedom in Greece, but it was the opinion of Winckelmann that the sculptors had rules by which not only the greater but the smaller proportions of the body were determined. It was, he said, owing to the adoption of recognised proportions that there was so much uniformity in Greek art. "Notwithstanding differences in execution, which had become a subject of observation even to the ancients as early as the works of Myron, Polyclethus, and Lysippus, still," says Winckelmann, "all the old works appear to have been executed by followers of one and the same school. The same general principles are visible in the works of the ancient sculptors from the greatest to the least." The sculptors of the Græco-Roman period would seem to have adopted the "Canon" or lance-bearer of Polyclethus as a standard of proportion. The well-known ratios which are given by Vitruvius suggest the arithmetical precision of which form was supposed to be capable. The foot was taken to be a sixth of the height, the fore-arm a fourth, the width of the breast a fourth, and so on. The Vitruvian proportions, which by some are supposed to have been taken from a Greek book, were given by Alberti, who wrote on the subject, thus connecting the Renaissance with antiquity. Proportion was not likely to escape the attention of Da Vinci, who had his own theory; but it would seem that he was no more satisfied with what he devised than with his other inventions. This is not improbable if it be true that Da Vinci's proportions were so elaborate it became necessary to divide the head into 248,832 parts. Michael Angelo believed in the power of the eye to secure fitting proportions, but it has been said that he prepared a drawing in which the proportions of the figure were noted.

* *The Sculptor and Art Student's Guide to the Proportions of the Human Figure.* The plates reproduced by John Sutcliffe from the original treatise entitled "Polyclethus," by Dr. Gottfried Schadow. Published by authority of the Committee of Council on Education, by Chapman & Hall, Limited.

It would need a volume to describe the efforts which have been made to fix a series of normal proportions. However much the schemes may differ from one another in principle, there is hardly one which has not found supporters. We find Winckelmann declaring that the rule of his friend, Raphael Mengs, was infallible, and that it probably corresponded with the method of the ancients. In our own time, no less perfection was claimed for the system of Mr. Hay, of Edinburgh, which approved itself to professors of geometry and anatomy, and was supposed to be equally applicable to architecture, painting, and sculpture. The late Dr. J. A. Symonds, of Clifton, in a lecture related a surprising instance of the utility of Hay's system in dispensing with skill in drawing. "I took," he said, "the height of a lady's head, measured from the vertex to a horizontal line, drawn at right angles to it from the termination of the chin. This lady is remarkable for the classical beauty of form in her face and head. Upon this I constructed a diagram representing the proportions of the profile, that is, describing a circle, a dominant ellipse, and the angles of $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{6}$ and $\frac{1}{7}$. The features were sketched in, so as to conform to a Greek model, by my daughter, who was not at all familiar with the lady's face. When the diagram was afterwards applied to the living face and head, the correspondence of the general contour and of the several divisions, forehead, nose, and mouth, was singularly close, and yet the only measurement taken from life was, as I have said, the height from the vertex to chin." Dr. Symonds, like many other people, had a notion that it was possible in a mechanical or empirical manner to produce beautiful figures, and it must be said that the notion has done much to bring proportion into disrepute. The great Greek artists probably recognised a canon, but it is evident there were limitations to its adoption. There is no better proof of this than the measurements of forty-two of the most famous statues which were undertaken by Count Clarac, and which demonstrate the variety of the proportions in the treatment of details, and to which the statues owe their character.

The aim of the majority of the theorists was to establish the proportions of a single perfect figure. Herr Schadow, the sculptor, when he prepared the series of drawings to which he gave the title of "Polyclethus," had no ambition of that kind. He considered that inasmuch as painters and sculptors have to represent life of various ages, a perfect form like the "Doryphorus" was not universally applicable, and that he would be rendering a service to his brother artists if he prepared accurate drawings of typical figures of youth, maturity, and old age. After half a century his work has lost none of its utility. A reproduction of the plates, with a translation of the description, is now available for English students and artists, and the work will be found to be invaluable to them.

Schadow begins with figures of infants, and the yearly development to manhood is illustrated on separate plates. He adopts the plan of enclosing the figures in a rectilinear framing, and thus by contrast with vertical and horizontal lines, the variations of the contours become more evident. The figures have been selected with care, some being of men who were recognised as well-shaped models, or who were noted for strength. Occasionally a comparison is made between a model and one of the classic statues. Details of feet and hands are given, and there are several drawings which illustrate facial development and expression.

Another important feature in Schadow's work is the attention given to equilibrium. Flaxman was of opinion that the Greek artists must have employed geometrical figures to determine the degrees of curvature in the body and to fix the centre of gravity in order to insure the equilibrium of their figures. In the works of the great Italian masters the Grand Duke of Weimar (who, as a disciple of Goethe, was versed in æsthetics) was most impressed by the attention given to this principle. Raphael's *Sistine Madonna*, he said, was more effective than the contortions of ten crucified martyrs, for, in addition to beauty of form, the picture possesses in the highest degree the property of perpendicularity in the figures. So important is the principle that even figures of still life are valueless if it be neglected. Schadow gives diagrams of equilibrium for nearly all his typical figures, beginning with those of boys of five years of age. But he is an artist rather than a mathematician, and he does not insist on a rigid adherence to his points, lines, and angles. The artistic sense, he explains, "must be brought into play in order that a satisfactory figure may result from the application of the rules. The movements of nature can-

not in every respect be represented by mere rules, such as may be applied to architectural drawings; and even the latter, when shown in perspective, must be treated with artistic talent, so as to bring all the parts into artistic harmony." It is evident from the latter part of this passage that "cooking" was not unknown to the perspective draughtsmen of Berlin in Schadow's time.

The plates in the English edition of the "Polycletus" are boldly drawn, in a style that is well adapted for diagrams. The dimensions of the parts, which are of as much importance as the outlines, are large and clear, and this is an improvement on the ordinary practice by which lithographers make figures so small that they are almost illegible. The plates are drawn in black, and the student will find it an advantage to draw some of the lines, such as those relating to equilibrium, in red or some other colour. As examples of lithography, the plates do much credit to Mr. Sutcliffe's draughtsmanship. It would, however, have been an advantage if the dimensions had been reduced to English measurements. The Rhenish foot appears to have been used, but it is equal to 12.357 English inches. So long as the diagrams are considered by themselves, it matters little what system of measurement is adopted; but it may lead to error if the dimensions—or some of them—on the diagrams are applied to figures on canvas or on marble.

PARIS NOTES.

THE Municipal Council and the authorities of the Bank of France appear unable to arrive at an understanding as to the best way of carrying into execution the scheme lately proposed for extending and enlarging the Bank buildings, and for opening up that part of the Palais Royal lying between the Rue de Valois, the Rue Neuve des Petits-Champs, and the Rue de Rivoli. In connection with the same project it was intended to make a broad thoroughfare connecting the new Hôtel des Postes with the Bourse and the Avenue de l'Opéra. The carrying out of these great improvements, which a short time back were generally considered as decided upon, now appears jeopardised, for the Upper Council of the Banque de France has decided that, unless within very short delay the Municipality notifies its acceptance of their offers, the scheme in question shall be entirely abandoned, and the necessary extension of the banking accommodation obtained in another manner, by absorbing into the offices the present apartments of the governor and vice-governor, for whom private residences would be erected in one of the fashionable quarters of the city. It seems hardly possible, however, that the Municipal Council should throw away such advantages as those offered by the Bank, for the saving that would thereby be assured to the city is estimated at upwards of six million francs.

It is now stated that two years more will be required to complete the internal decoration of the Hôtel de Ville, especially the artistic work in the Salle des Fêtes and its dependencies. A supplementary vote of rather more than a million francs will have to be passed by the Municipal Council for the due execution of this and other work not provided for in the original estimates, which amounted to 25,122,688 frs. 90 c. These were divided into three main categories. On the first—comprising the foundations, masonry, iron, and brickwork, &c.—the architects managed to effect a saving of about a million francs; the second—timber and woodwork, decorative wood-carving, paving, heating apparatus, &c.—exceeded the estimate by 1,350,000 frs.; and the third, which was for the artistic decorative work of the interior, will cost at least double the sum set apart for it. Altogether, the total cost of the building when completed is now set down as 26,210,000 frs.

The visitors to the Salon on Sunday, the first free day, numbered 38,000 at 5.30 p.m., and in all, including 1,100 who had paid for admission between eight and ten in the morning, 39,315 persons entered the building during the day. This total is 4,000 more than that on the corresponding Sunday of last year, but is considerably below that of 1881, when there were 48,000 visitors. On varnishing day the entries numbered 23,730, nearly 6,000 more than last year.

The sculpture section of the Académie des Beaux-Arts have adopted the subject proposed by M. Chapu for the final competition *en loges* for the Grand Prix de Rome. This is a bas-relief of *The Death of Diagoras of Rhodes*, the motive of the work to be as follows: "Diagoras, who had in his youth gained a brilliant victory in the Olympian games, brings up to the same competition two of his children, both of whom prove successful,

and receive the coveted crown. They immediately place the decoration on the brows of their father, and, taking him on their shoulders, carry him in triumph among the spectators, who overwhelm the old man with felicitations and flowers, many of them crying out, 'Die, Diagoras, for you have nothing further to wish for!' The father, overcome by the too violent emotion of his happiness, expires in the arms of his sons." Thirty-six hours are allowed the competitors to complete their preliminary design, which must be modelled on a ground 13 inches by 16½ inches. These are sealed and deposited with the Secretary of the Academy. For the final execution of the bas-relief, on a ground 62 inches by 46 inches, seventy-two days are allowed, and the decision of the jury will be announced on July 30 next. The ten competitors are MM. Puech, Lombard, Quinton, Pech, Gasq, Pépin, Pène, Desvergnès, Verlet, and Sul.

The Fine Arts Committee of the Paris Municipal Council have decided to order the execution in bronze of the following works, purchased for the city at last year's Salon: *La Fenaison*, by M. Barrault; *La Porteuse de pain*, by M. Coutan; *Bâton de Vieillesse*, by M. Massoulle; *Non omnes morimur*, by M. Escoula; *Une Amitié*, by M. Pezieux; and *Monnaie de singe*, by M. Roland. The cost is estimated at 36,300 frs. M. Auguste Paris' group, *Le Temps et la Chanson*, and M. Daillion's *Réveil d'Adam*, are likewise to be reproduced in marble, at a cost of 18,000 frs. and 14,000 frs. respectively.

THE PATENTS, DESIGNS, AND TRADE MARKS BILL, 1883.

A COMMITTEE of the Manchester Chamber of Commerce have prepared a report on the New Patent Bill. In the opinion of the committee the principles on which the Bill now under consideration is based, as applied to patents and the provisions for its administration, are deserving support in the legitimate interests both of inventors and of the general public. This general approval is extended to parts 3 and 4, relating to designs and trade marks respectively, and subject to certain amendments the Bill as a whole, if it become law, will be a beneficial change. Its provisions are simple and practical, and the committee have only the following remarks and suggestions to offer.

Part II. *Patents*.—The Bill recognises the claims of inventors, long urged, for a reduction of patent fees, and appears to have been drawn with a desire to adopt amendments of a practical character which have from time to time been pressed upon the Legislature. To a fee of 4*l.* for a limit of four years there can be no objection, but the total cost for the full term, which is hereafter suggested as eighteen years, should not exceed 50*l.* The committee make various suggestions for the amendment of clauses. For instance, in clause 5, section 2, at the end of line 2 insert the word "either;" and in the line following, after the word inventor, insert "or the legitimate owner by purchase." The legitimate owner by purchase should have the power of securing his rights of property in an invention by the grant of a patent on his own application. "Six" in place of nine months should be the time allowed for the deposit of a complete specification. The limit for the duration of a patent should be not less than eighteen years.

Part III. *Designs*.—Copyright in a design (clause 47, sec. 1) should be extended to five years from the date of registration, and on expiry of that term there should be a right of renewal for five years on payment of a special fee. (Note.—In the Oriental, Chinese, India, and some of the African markets, several years may elapse before a pattern obtains repute. The consumers in these distant markets are slow in expressing a preference for a particular pattern.) Piece-goods should be exempted from clause 48, as they are generally cut into various lengths, rendering the preservation of a "prescribed mark" impracticable. The stamp or "prescribed mark" is necessarily removed when goods are remade up for sale in foreign or home markets. Under clause 50 information as to registration can be obtained. Amongst other alterations the committee recommend that the words in the 20th and 21st lines, "or a person authorised by the comptroller," should be omitted. Clause 49, sec. 2, should be omitted, as it is undesirable to encourage and facilitate the practice of copying designs even after expiry of the copyright. The words in the second line of clause 50, "together with its mark of registration," should likewise be omitted. The forfeit for every offence (clause 55) should be not exceeding 100*l.* A design should be considered original which has not before been applied to any article in the class or classes of goods for which registration is claimed. At the end of clause 57 should be added, "in the class or classes in which the design is registered."

Part IV. *Trade Marks*.—The owner of a duly registered trade mark should have the right to dispose of it as he would of any other property, without restriction, except that of giving due notification of its disposal to the comptroller.

NOTES AND COMMENTS.

THE British Museum has just acquired and placed in view a series of six mural paintings found in the seventeenth century in the tomb of the NASONES near Rome. For a number of years these paintings have been in the possession of Mr. GEORGE RICHMOND, R.A. Although a good deal restored in places, they will serve admirably to give a notion of a branch of ancient art little known hitherto by examples existing in this country, or, indeed, outside of Italy. The subjects represented are HADES carrying off PERSEPHONE in a chariot, a beautiful design of DIONYSOS offering a bunch of grapes to ARIADNE, a group of a Mænad and a Satyr, a winged Victory, a winged Genius, and a floral ornament.

MR. SAMUEL REID, who died on Sunday last, will be a loss to English art. His water-colour drawings and drawings on the wood of old buildings were always excellent. His success was in a great measure owing to his early studies in days when it was his intention to become an architect. But his work was not confined to the representation of buildings. His drawing of the Bass Rock may be said to be the only one that suggests the massiveness of an island which appears to have little grandeur when seen from a distance.

THE inconvenience of the Dublin Court-house has long been notorious, but the difficulty hitherto has been how to raise money to erect a more commodious building. It is used for county as well as for city cases, but the county declined to contribute towards the cost. The Exchequer should also, it was claimed, become a contributor; as the Court-house has been in a great measure a Government building. The difficulty has been to some extent removed. The Treasury has agreed to recommend Parliament to contribute a sum of 13,500*l.*, being one-third of the estimated cost of the new building, including the cost of site, on condition that the plans and estimates are approved by the Government. The remainder of the cost is to be shared by the county and city of Dublin, the county contributing one-third and the city two-thirds. The Commissioners of Public Works are to be authorised to advance the money at 4 per cent., to be repayable in forty years. A site has to be selected, and other arrangements are to be made; but should there be a competition there is little likelihood that the Dublin Corporation would allow the prize to be carried off by an English architect.

MR. ROBERT WALKER, architect, of Cork, has had printed a lecture on the "City of Cork," which he lately delivered before the local Literary and Scientific Society. From it we learn how much the "Beautiful City" needs in the form of sanitary improvements. The drainage continues to be in a primitive condition. Mr. WALKER says Cork, like Dublin, is without a main drainage system, that in the low-lying districts (Cork is derived from the Celtic word which stands for a marsh) there are imperfect drains which cannot possibly perform the functions for which they were constructed; and yet many of the drains of the high level districts are carried into them, while all the drainage is conveyed into the River Lee. Municipal buildings are also required in Cork, and although the city may with reason claim to be cultured, it has no building adapted for meetings in which questions of art, literature, or science can be discussed. The art gallery of the School of Art occupies the top storey of the building, which was once the King's Store, and it still "possesses the distinction of being the worst and most ill-conditioned art premises in the three kingdoms." The Corporation have at present a Bill before Parliament in which powers are sought to borrow 10,000*l.* to complete bridges and other works, under the Improvement Act of 1875. The Lee is as important to Cork as the Thames to London, and it should be made more available for traffic than it is at present; but the local authorities might with advantage remember that there are other matters of importance in addition to bridges and docks which they have long neglected.

to the uncertainty of our knowledge of the strength of materials. He considered that the science is but little advanced, and the part of it relating to the quality known as hardness least of all. The "scale of hardness" for stones and metals used by mineralogists and engineers was alluded to as a mere test in order of merit in respect to a little understood quality, regarding which no scientific principle constituting a foundation for definite measurement had been discovered. This state of things would continue until some more practical method for the numerical reckoning of the phenomena was established.

THE Sanitary Assurance Association is an ambitious body, although a year's entrance fees and subscriptions from the members amount to no more than 80*l.* 17*s.* A meeting of the association, attended by a few people, was held on Wednesday, when the following resolution was adopted:—"That the Council of the Association be requested to consider whether they cannot recommend legislation compelling the builders of all new dwellings to obtain a certificate from some authority or qualified person as to their sanitary condition before it shall be lawful for such buildings to be inhabited." The grammar of the sentence is not quite clear; it is hard to say whether it is the sanitary condition of the council or of the builders which demands the investigation. But probably the resolution refers to houses, and if so, it would be so Quixotic an undertaking for the Council to "recommend legislation," we can hardly believe the resolution was meant to be taken in earnest.

AN architect in the United States runs the risk of ruin if he accepts a Government appointment. His office is supposed to be one of the prizes of politics, and he must expect to be dispossessed by fair means or foul. A few years ago the aged father of a post-office architect came to England in the expectation that he could bring English public opinion to bear on those who were bringing accusations against his son. According to the latest newspapers, another post-office architect is the victim. He and assistants are charged with corruption, fraud, extravagance, maladministration, favouring fraudulent contractors, employing incompetent assistants, paying exorbitant prices for labour and materials, and, in fact, with every possible or impossible crime that can be committed by an official. But according to the architect the charges are old ones, which have done duty before, and are now revamped. They refer to transactions which occurred before his time, and with which he was not connected. When they are aware of the treatment of their predecessors in office it is surprising that candidates can be found for official appointments, especially when it is remembered that the salaries are inadequate.

ON Monday, at a meeting of the Society of Engineers, a paper was read by Mr. BOWER, on "The BOWER-BARFF Process of Preserving and Ornamenting Iron and Steel Surfaces." It was explained that in the BARFF process the film of magnetic oxide was produced by subjecting the articles, at a red heat, inside an *iron* muffle, to the action of a superheated steam; while by the BOWER process the articles, at a similar heat, were subjected, inside a *brick* chamber, to the action of products of combustion and of superheated air. The BOWER process is better adapted for cast iron, and it proceeds on the principle of first forming sesqui-oxide and then reducing it to magnetic by hydro-carbon gases or carbonic oxide. The BARFF process produces magnetic oxide at one operation, but it is costly and takes a long time, while the BOWER is obtained in two operations, and a very cheap and effective coating is produced in less than half the time of the other. Mr. BOWER showed a very curious property of magnetic oxide. He applied a brush formed of wires of different metals, first of all, to a casting which was not coated, and on which no effect was produced; then to a similar one which had been coated, when it was immediately covered at all the parts touched by the brush with a beautiful shining coat of the metal of which the brush was formed. This was attributed to the fact that magnetic oxide not being metallic, and to some extent gritty and porous, it had rubbed off by attrition some of the metal from the wires; and he expected that this would supersede the existing methods of bronzing and of depositing metals for the commoner kinds of Birmingham goods.

SIR WILLIAM THOMSON, in lecturing on "Electric Units of Measurement" at the Institution of Civil Engineers, referred

WALL PAINTING IN THE PANTHEON, PARIS.
 By M. FINIS de CHAVAN.

ILLUSTRATIONS.

THE WEIGHING-HOUSE AT ALKMAAR.

THIS building is one of the most characteristic pieces of Dutch Renaissance. The building dates from A.D. 1582. It is used for the weighing of cheeses, over 1,000,000 lbs. of cheese being weighed there annually. The illustration has been reproduced by the ink-photo process from a water-colour drawing by Mr. R. PHENÉ SPIERS, F.S.A.

KILN ROUGH, SURREY.

THIS house has been designed to meet the exigencies of the site. The stone to be used is rubble iron and Ewhurst stone mixed, while the quoins, transoms, mullions, arches, &c., are to be worked in Ewhurst stone. The upper storeys are to be built hollow, and of half-timber construction. The roofs to be covered with Broseley tiles. Messrs. JOHN and JOHN BELCHER, F.R.I.B.A., are the architects. The tender of Messrs. BROWN & SON, the builders, of Albury Heath, is 2,560*l.*, exclusive of internal fittings.

WALL PAINTING IN THE PANTHEON, PARIS.—II.

THE principal subject in the series of wall paintings undertaken by M. PUVIS DE CHAVANNES for the Panthéon in Paris, is the meeting between ST. GENEVIÈVE and ST. GERMANUS, Bishop of Auxerre. The bishop was on his way to Britain, under circumstances which may be described by an extract from LINGARD.

"About the commencement of the fifth century, PELAGIUS, a Briton, and CELESTIUS, a Scot, had advanced several new and heterodox opinions respecting the nature of original sin and divine grace. AGRICOLA, one of their disciples, made an attempt to diffuse the new doctrine among their countrymen; and the British prelates, unaccustomed to the subtleties of controversy, solicited the assistance of their neighbours, the bishops of Gaul. With the concurrence of Pope CELESTINE, GERMANUS, of Auxerre, twice visited Britain, once in 429, in company with LUPUS, of Troyes, and again in 446, with SEVERUS, of Treves. By his authority the doctrines of PELAGIUS were condemned and suppressed, and schools for the education of the clergy were opened in several dioceses. On one occasion the Gallic prelate resumed a character in which he had distinguished himself during his youth. A party of Picts and Saxons were plundering the coast. GERMANUS put himself at the head of the Britons, and led them to a defile, where they awaited in ambush the approach of the invaders. On a sudden, by his command, they raised a general shout of Hallelujah; the cry was reverberated from the surrounding hills, the enemy fled in amazement, and numbers perished in an adjoining river. By our ancient writers this action was celebrated under the name of the Hallelujah Victory."

It was in 429 that GERMANUS, on his journey from Auxerre, stopped at Nanterre. His arrival was an event in the village, and the inhabitants flocked around him. While addressing the people, the bishop, according to the legend, noticed GENEVIÈVE, then a child of seven years, and spoke to her. It is also related that during the long time when psalms and prayers were recited in the village church the bishop held his hand upon her head. On that occasion the service was of unusual length, for it is said that "though anciently the canonical hours were punctually observed in the divine office, SS. GERMANUS and LUPUS deferred None beyond the hour, that they might recite it in the church rather than on the road." M. PUVIS DE CHAVANNES has depicted St. GERMANUS addressing the people at Nanterre in the open air, for the painter has always shown his predilection for out-of-door scenes, and he has not hesitated to adapt the action of the bishop to the occasion, for, as we have already stated, it was during service in the church that GERMANUS placed his hand on the child's head.

The representation of the meeting fills three bays in the church; the central part is shown in the illustration.

The Contract for the Ulster Reform Club, Belfast, has been let to Mr. Henry, of Belfast. The cost of the building, including the grates, chimney-pieces, internal plumbing, tiling, bells, hoists, heating, and other fittings will be under 12,000*l.* The work will be carried out at once under the superintendence of Messrs. Maxwell & Tuke, architects, Manchester.

THE ARCHITECTURAL ASSOCIATION.

THE eleventh ordinary meeting of the Association was held on Friday evening, the 4th inst., Mr. E. G. Hayes, president, in the chair. The following gentlemen were elected members: Messrs. A. J. Balding, W. M. L. Seaman, A. E. Douglas, A. Bond, T. Powley, F. Amsdon, and D. J. Caddy.

Votes of thanks were then passed to the members of the Entertainment Sub-committee, and band, in connection with the lately held soirée; to Mr. Waterhouse, A.R.A., and to Mr. Trubshaw in connection with the visit to St. Paul's Schools, Kensington, and to Mr. Seddon and Mr. Gough.

No visit will be made on the 12th (to-day), but the next visit will be on the 26th, to the Royal Courts of Justice Chambers.

The President called attention to a syllabus of lectures, &c., to be given in connection with the Surveying Class by Mr. A. T. Walmisley, the instructor. The syllabus includes six lectures, to be given at the Association Rooms, 9 Conduit Street, on Thursday evenings, from 6.30 to 8 p.m., and Field Lessons to be given on Hampstead Heath, on Saturday afternoons, at 3.30 p.m.

A paper was read by Mr. J. O. Smith upon

Museums.

During many years' attendance at these meetings, I do not remember listening to a discussion upon the subject of museums, apart from sundry references from time to time to the well-known depository of architectural relics in Westminster. Having had opportunities during the last few years of watching the internal workings of one of the most recent large buildings of this description, I have thought a few remarks upon this rather interesting class of buildings might not be out of place in this room.

The primary considerations to be borne in mind in designing a museum, whether large or small, are:—

1. The classification of the objects to be exhibited.
 2. The conditions necessary to insure that the various sections may be well defined, and the individual items may be exhibited under the most advantageous conditions as regards convenience of access, light, and security.
 3. The maintenance of an equable temperature within the building, with good ventilation and the exclusion of dust.
- In museums of any pretensions to completeness there should be, in addition to provision for the proper exhibition of objects—
1. Rooms specially set apart for the examination and study of special objects.
 2. Storage accommodation for duplicate specimens, casts, or objects awaiting examination prior to exhibition.
 3. Preparation-rooms for the necessary work incidental to preparing specimens for exhibition.
 4. Lecture-rooms (large and small) for general and sectional lectures to students.
 5. Accommodation for a controlling or executive department.

When the space required under these various heads has been as satisfactorily disposed of as the size and financial limit usually imposed would allow, there remain to consider the problems of lighting, warming, and ventilating the numerous divisions of internal space appropriated to so many varied purposes, and the arrangement and construction of the fittings for preserving and protecting the objects exhibited.

The classification of the objects to be exhibited, and the space they will require for exhibition, must obviously vary, and be dependent upon their nature, number, and size. Full particulars will not only be required of the actual space to be occupied by certain classes of objects, but the principle upon which their final arrangement will be based should be made known to the architect.

The system of subdivision by which, in large museums, certain galleries or rooms are kept solely for certain kinds of exhibits, although very desirable, is not always practicable in smaller buildings. On this ground it has been urged by competent authorities that in the smaller museums—which will undoubtedly become more numerous in large towns and districts than at present—the typical arrangement of certain classes of objects should be adopted, and all superfluous specimens not specially representative of particular types should be carefully excluded, with the view of placing clearly before an ordinary observer or student the materials for obtaining a good general grasp of the various branches of science and art, without trespassing upon the space which should be devoted to the local objects of interest which, in the smaller local museums, would always occupy a prominent place. These will also require, and should receive, attention, so far as circumstances will admit, to insure their due separation and classification in separate rooms or galleries. While the larger national museums should be designed to illustrate, as fully as possible in detail, the vast stores of knowledge accumulated from time to time in all departments of science, art, and history, the smaller museums should be treated as epitomes of information on general subjects, wherein the local features of historical, physical, or archaeological interest should receive more attention in detail. These general principles will naturally affect the design of individual museums, and render varied treatment essential. I propose to consider first, now, the arrangements essential to the larger national museums in order to emphasise the conditions which are necessary to insure success in

all. In order to illustrate the various points more fully, I have placed upon the screen a few drawings, for which I am indebted to the courtesy of Mr. John Taylor, F.R.I.B.A., Surveyor to H.M. Office of Works and Public Buildings, in whose charge the buildings referred to are placed.

The British Museum is divided into eight departments, viz.:—Printed Books, Manuscripts, Antiquities, Prints and Drawings, Zoology, Geology or Palæontology, Mineralogy, and Botany. Each department is under the charge of a keeper and staff of assistants and attendants, for whose use studies and workrooms are appropriated. The four last-named departments are under the charge of a superintendent of natural history. Considerable additions have recently been made and are now in progress by the erection of additional accommodation for the first four departments upon the site at Bloomsbury, and the entire collections belonging to the four last are being gradually removed to South Kensington, to the large building designed for their reception by Mr. Alfred Waterhouse, A.R.A.; and as the plan of that building has been designed to meet the requirements of the best authorities, a glance at the internal arrangements and disposition of the departments may not be uninteresting.

As regards space, the zoology department is the most important of the four branches of science housed at the Natural History Museum. It will occupy more than half the area of the building. The collection will be arranged in thirteen distinct galleries, viz.: 1. Osteological, second floor; 2. Mammalia, first floor; 2A. Mammalia, saloon; 3. Birds, ground-floor; 3A. Birds, saloon; 4. British natural history saloon, ground-floor; 5. Corals, ground-floor; 6. Shells, ground-floor; 7. Reptiles, ground-floor; 8. Fishes, ground-floor; 9. Starfishes, ground-floor; 10. Insects, ground-floor; 11. Cetacea, basement.

Next in size is the geological collection, arranged in eight galleries, all on the ground-floor, viz.: 1. Fossil mammalia; 2. Fossil mammalia; 3. Fossil reptilia; 4. Fossil fishes; 5. Fossil mollusca; 6. Fossil sponges, corals, and plants. Two other galleries will probably soon be opened for—7. Geographical and typical collections; 8. A special stratigraphical series.

The collections of minerals are exhibited on the first floor, in two galleries: 1. Containing the general collection exhibited in table-cases and some "rocks" in the wall-cases; 2. Meteorites, crystals, and rocks.

The botanical department is located on the second floor. The collections are divided into two parts, one portion arranged to illustrate the various groups of the vegetable kingdom, and the broad facts on which the natural system of the classification of plants is based; the other portion is intended for the use of students, and consists of the great Herbarium, stored in cabinets specially designed for facilitating reference.

Some idea of the floor space occupied by these collections may be obtained from the dimensions of the principal galleries, which are as follow: Six front exhibition galleries are 278 feet 6 inches long by 50 feet wide; six northern exhibition galleries, 137 feet by 40 feet; six northern reserve galleries, 137 feet by 20 feet. The reptilian gallery (geology) is 230 feet long by 21 feet wide; the coral gallery (zoology) is 200 feet by 17 feet.

On the first floor accommodation for the representative of the principal librarian and his staff is provided contiguous to the board-room for trustees' meetings, and to the lecture-room. This accommodation consists of board-room, about 38 feet by 17 feet, and secretary's room, about 17 feet by 16 feet, with two clerks'-rooms, lavatories, &c., and store-rooms over; the lecture-room is about 57 feet by 17 feet. The keepers and their chief assistants have studies next to the principal galleries of each department, while the two larger departments of zoology and geology have also private studies and work-rooms in the small reserve galleries which lie between the large northern galleries on the ground-floor. The large rooms in the basement facing south form a series of well-lighted studies, store-rooms, and work-rooms for the staff attached to the several departments. On the north and east sides are the workshops, mess-rooms, chemical laboratory, &c., while a large area at the west end is appropriated to the display of skeletons of huge whales slung from the ceiling. The central portion, under the museum and central hall, forms a vast dry storehouse for future acquisitions.

The collections of objects preserved in spirit, which have hitherto been located in extremely limited quarters at the British Museum, are now being transferred to a separate building specially designed to reduce to a minimum the risk from fire. A laboratory and studies are attached to the spirit building for the use of the staff and for students. The spirit building and studies measure about 154 feet 6 inches by 51 feet, and are placed 60 feet north of the main building. The museum building is set back about 100 feet from the Cromwell Road. The length of the south front is 675 feet, and the towers are 192 feet high.

The central hall is 170 feet long by 97 feet wide and 72 feet high; the staircase is 20 feet wide.

The whole of this large building is extremely simple in plan and admirably arranged. There are a few points about it, as at present appropriated, which strike one as having been overlooked, e.g., the lecture-room, a long, narrow room, is ill-adapted for its purpose, originally designed, I believe, for a refreshment-room.

The executive officers are as far as possible from, and not as near as possible to, the principal entrance, with the exception of the superintendent; and the accommodation provided for refreshing the body in this great temple of knowledge is of the most imperfect character. There are two buffets, but to get at them from the entrance one must walk twice the length of the central hall, and mount some 40 feet to the second-floor landing. A noteworthy feature is this central hall, which, with the dozen recessed bays on either side, is intended to form an index museum or popular typical collection of natural history subjects. The object of such a collection has been thus described by the superintendent (Professor Owen):—

"One of the most popular and instructive features in a public collection of natural history would be an apartment devoted to the specimens selected to show type characters of the principal groups of organised and crystallised forms. This would constitute an epitome of natural history, and should convey to the eye in the easiest way an elementary knowledge of the sciences."

This portion of the museum is not yet fitted up, but the necessary fittings for carrying out this idea are in progress, and in a few months this large and important building will be completely fitted, and we shall be in a position to judge of its value as a vast national storehouse of natural objects, and as a means of popular education in some of the most interesting branches of knowledge.

(To be continued.)

THE ROYAL ACADEMY.

THE annual dinner of the Royal Academy was held on Saturday evening, when the president, Sir Frederick Leighton, and council entertained the usual company. The health of the President of the Academicians was proposed by the Dean of Westminster. In conclusion he said: Of your president's claims to his proud position I need not speak. You know, my fellow-guests, his work, and you know the man; something you all know of his many, his varied, his wide-reaching gifts, something of his character and himself. These things are beyond my praise. I could only wish that one striking feature in his career and his work could find a better interpreter than myself. No one could for one moment think of Sir Frederick Leighton as a recluse or a solitary thinker. You will have felt that behind the courteous host and the generous friend is one whom we are proud to hail as the president and leader of the honoured band of English painters whose guests we are this evening.

Sir Frederick Leighton in responding said: Mr. Dean, I rise to tender to you the thanks of my colleagues and myself for the words in which you have invited our guests to drink prosperity to the Royal Academy in the persons of its members, and to those guests thanks not less sincere for the reception they have given to this toast. I am fully conscious of the collective nature of the toast, and that my prominence in it is purely official, and in a manner incidental; but I cannot wholly pass over in silence those terms in which you, sir, were pleased to allude to me. It has hitherto been year by year my unwelcome task to strike at the outset of my response to this toast a jarring note of sadness, and to record gaps made during the twelve past months in the muster-roll of the Academy, and I may not hope for the year of which the retrospect, however bright, will be free from such sobering shadows. Of the year which closes to-day I may at least say this—that it has seen only one of our colleagues fall from his place among us. Edward Bowring Stephens, the Devonshire sculptor, died last autumn, not very far stricken in years. He was an artist of vigorous gifts, and a man whose simple uprightness of nature and true kindness of heart drew and held to him the warm esteem of all who learnt to know him. The exhibition which is about to open has been spoken of in terms of praise, and, indeed, I think that both in promise and in fulfilment of promise it holds its own with honour by the side of those of previous years. But for myself, I own that two predominant feelings much engross me in connection with this exhibition, and draw away my thoughts from its quality. One is a feeling of most real sorrow at the not small number of meritorious works which lack of space has excluded from our show; the other is a glad anticipation of the period, now no longer distant, when a very material addition to our galleries will, without wrong to the character of the exhibition, enable us, we trust, to lighten many a heart now burdened with bitter disappointment. The duty of avoiding, if possible, that least pardonable of sins, a tedious length of speech, permits me to direct the few words which I shall say to-night to but one salient point of interest in the Academic year which has just expired. Now, perhaps, the most noteworthy feature in that year is to be found in the peculiar character of the recent Winter Exhibition, in which, by an exceptional inversion of the usual proportion, the works of dead British artists filled a larger share of space than did those of the old masters, properly so called, of whom the study is the first and paramount aim of these collections. Those old masters were not, indeed, unworthily represented. Seldom, for instance, has the wizardry of Rembrandt's palette fascinated us more than on a certain canvas which hung in an adjoining room to this. Once more we have seen Vandyck and

Jan Steen adorn with equal dignity of art the one the highest, the other the lowliest: walks of life. Venice, Florence, the pious Umbria, have again drawn us within their spell. By their side England has shown us Sir Joshua Reynolds, Gainsborough, and Turner, and she has not been humbled. Nevertheless the feature which has imparted a distinctive character to this exhibition, and which has most riveted the public gaze, was the posthumous display of the works of two recently deceased artists, J. Linnell and Dante Gabriel Rossetti. Singularly interesting was the contrast between these two powerful men, akin, perhaps, in nothing save in that deep-lying, unyielding strength of conviction which is the main-spring of all good work. The one, the elder, though in the eager many-sidedness of his gifts, and the trained obedience of his hand, he touched in turn every branch of the graphic art, was yet pre-eminently a landscape painter, moved chiefly by the pastoral and woodland scenes, and by the changeful skies of our own country. Him the tumults of white clouds delighted, and the blue riot of rolling hills, the red ripe corn, sand slopes brown and burnished, and the green forest's gloom. On his canvas the drowsy reaper nods beneath the sheaf, the shepherd pipes and watches, the new-felled timber strews the ground, or strains the waggon's aching wheel. He was a poet; his pictures were idylls. How wide an interval divides him from that other poet whose work confronted his last winter in these rooms, the painter of *Beata Beatrix* and of *The Dream of Dante*, the writer of "The Blessed Damozel," of "Rose Mary," and of "The King's Tragedy"—for in speaking of him, though Art alone concerns us here, I must allude to the writer as well as to the painter, because words, of which he was in truth a master not easily surpassed, as well as form and colour, were imperatively needed for the full embodiment of his creative impulse. A recluse, and yet a leader, so kindling and so contagious a fervour glowed within him that to the intimate among his friends who, now that he lies in death, live on in an after-glow of loving memory, it is scarcely yet given to gauge him and his work in the light of a dispassionate vision. To Rossetti's pencil the outer inanimate world, unless it be perhaps the world of flowers, seemed to have little charm. But the contemplation of the soul's inner world, and of the storms and passions of the human heart, and the workings of an imagination steeped in mysticism to the lips, these filled and absorbed him, and, be it in burning words or in burning colours, compelled expression on the canvas or on the written page. Whether or not he clearly kept before him the boundaries of Literature and Art, whether or not his technical powers responded always to his call, whether the marriage of sensuous concrete forms with mystic visionary thought, after which he strove, be or be not fully achieved by him, or be at all achievable, the strong, original, and fiery spirit which passed away with Rossetti's breath will ever remain a deeply interesting and, to many of us, a strangely fascinating study. Gentlemen, it is not idly or at chance that I have sought to put before you to-night these widely contrasted types on either side of the undying English masters of the last century. I see in this contrast a lesson, and I read in it a hope. I am taught by it once more the width and the varied wealth of the kingdom of the painter's craft, and I am led to a hope in which no doubt is mingled that, as that width and variety are nowhere more conspicuously shown than in English art, so through the masculine, self-trusting strength of temper which is our boast, and of which they are in part the fruit, they may daily become more surely a mark and cardinal virtue of our school.

THE NATIONAL GALLERY.

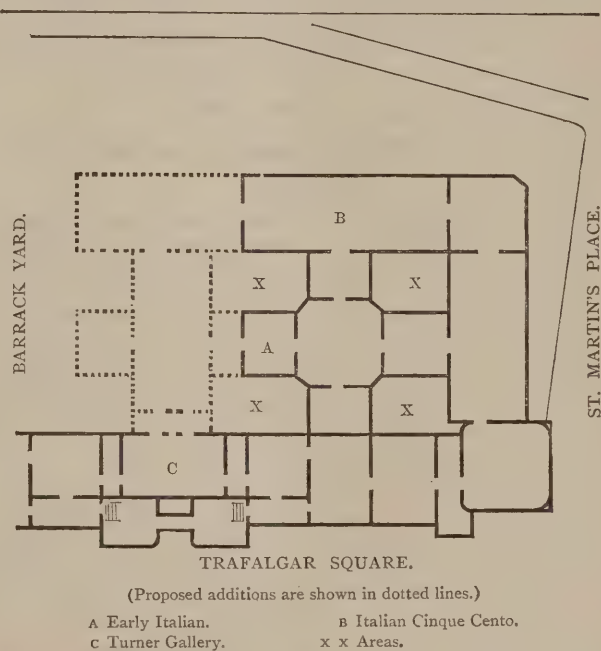

IT was announced on Saturday at the Royal Academy banquet by Earl Granville that the Government had promised additional building accommodation to the National Gallery. Of the need of some considerable addition to the space available for pictures there has long been no doubt. Valuable works have been so rapidly accumulating that the spacious rooms added by Mr. E. M. Barry in 1876 have for some time been shown to be quite inadequate to their purpose. Many pictures have been kept out of sight for sheer want of room to show them, while others, like those purchased at the Hamilton sale, have been hung on screens to the great inconvenience of visitors, who now find it very difficult to see and study the works on the walls.

In old times, before any additions were made to the original building, the space between the back of the National Gallery and the narrow, awkward streets called Hemming's Row and Orange Street was occupied by St. George's Barracks and exercise ground, and by the workhouse of the parish of St. Martin-in-the-Fields. The latter was at length bought by the Government, with the intention of extending the Gallery towards the north-east up to the point where the improved street would begin. But, as is well known, this intention has never been fully carried out. The old workhouse buildings still exist, and are used for Government stores, while Hemming's Row remains as narrow, dingy, and dangerous as ever. Mr. Barry's new rooms only extend back about two-thirds of the way to that street, while a considerable space remains between their eastern limit and St. Martin's Place. St. George's Barracks remain at present as they were.

When the question of the best mode of extending the Gallery

came to be considered, it was found to be undesirable to build rooms to the north-east on account of the impracticable nature of the ground, which is so shaped that it would have been impossible to build rectangular galleries there. The obvious plan was to extend westward, in the direction of the barracks. Ultimately it may be hoped that new quarters may be found elsewhere for the soldiers, and that the barrack building itself may be removed, so that an ample and symmetrical block of galleries may be built, reaching westward the whole length of the existing frontage. This, however, must come by degrees, and the Office of Works only intends at present to take the first step towards it. The plans actually prepared are as follow:—

New galleries are to be built immediately in the rear of the centre of the main building, to adjoin those built from the designs of Mr. Barry. The galleries would consist of one measuring 92 feet by 40 feet, running north and south, at the end of which would be another, 87 feet by 40 feet, running east and west, the latter forming a continuation of the great Italian room in Mr. Barry's building. To the right and left of the centre of the longer gallery will be two small rooms, each 30 feet by 20 feet.

To carry out this plan a very important alteration in the present arrangement of the building is proposed, but it will not be effected until the new galleries themselves have been built. The present rather insignificant staircases are to be abolished, and in their stead we are to have a new grand staircase, immediately behind the vestibule, leading straight into the first of the new galleries. To make this staircase it will be necessary to do away with the existing "Turner Room"—a badly-lighted gallery—and to find accommodation for Turner's pictures elsewhere. The walls of the new grand staircase will afford space for many large pictures not of the first importance, while the space gained by the removal of the present staircases will be utilised for new rooms.

The picture space to be provided in the new galleries and staircase is about 958 feet lineal, or a net addition of 764 feet lineal. That given by Mr. Barry's building was 1,235 feet; while the total space given by the original galleries was 1,428 feet. It will thus be seen that the contemplated additions are of the greatest importance. It may be added that the estimated cost of the whole building is no more than 66,000*l.*, including 2,000*l.* to be paid to the War Office authorities for rebuilding the guard-room. The site already belongs to the Government, and as no rent is paid for it no loss will be incurred by its appropriation to new uses. It is intended to ask for the first vote on account during the present Session, and to begin operations as soon after as possible. It is expected that the whole work may be completed in four or five years.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE last fortnightly excursion for the session of this Association took place on Saturday. The members started from Edinburgh at 10 a.m., and proceeded by Inveresk to Ormiston Old Church, where rubbings were taken of the memorial brass tablet to the memory of Lord Justice-Clerk Cockburn, of date 1535. Thereafter a visit was paid to the famous yew-tree, under which a congregation of not less than two hundred, as tradition says, was addressed by George Wishart about the year 1545. The tree is still fresh and vigorous, having been carefully tended by the proprietors. The company then proceeded by the "House of Muir" and Fountainhall House to Pencaitland, where the interesting old

church was examined. This edifice, while nominally having the date of 1631, appears in many parts to be of an earlier time. Indeed the formation and tracery of some of the windows would indicate the date of its erection to have been more than a century earlier. The Association then visited Winton Castle, the seat of Lady Ruthven. Mr. Lessels, architect, conducted the company round the building, and explained the various changes to which it had been subjected. The principal part of the building as it now stands was built by George, third Earl of Winton, in 1626. It is very much in the style of Heriot's Hospital, among the points of resemblance being the chimney-stalks, the window-head ornaments, and corbelling. The fact that the master of works of Winton House was also the master of works of Heriot's Hospital may to some extent explain the resemblance. The more recent additions to Winton, which were effected by Sir Jeffrey Wyatt, the architect of Windsor Castle and of the Brighton Pavilion, are entirely out of keeping with the style of the original edifice. Mr. Lessels then conducted the party through the interior of the house, pointing out the beautifully panelled plaster ceilings of the different rooms, a feature which renders this mansion specially noteworthy to architects. After refreshments, provided by Lady Ruthven, had been partaken of, a vote of thanks was accorded to Mr. Lessels, and also to her ladyship for her kind entertainment, and the members then returned to town, after a most instructive and enjoyable outing.

LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

A CONVERSAZIONE has been held in Owens College, Manchester, to inaugurate the new Lancashire and Cheshire Antiquarian Society. Professor W. Boyd Dawkins, the president, said they had gathered to mark the birth of a new Society in Manchester, a Society which he hoped would do a great amount of good work. The work of the Society would simply consist in placing on record every kind of information they could lay their hands upon relating to the past. The present time was particularly opportune for this purpose. In Manchester the old order was rapidly yielding place to the new—the old Manchester was rapidly disappearing and a new Manchester was rising up; and what was taking place in Manchester was of course taking place everywhere, in the tiniest village equally as in the great centres of population. It would be their business to place on record the old before it disappeared utterly in the new. The development of new railways and of various engineering was revealing to them vestiges of ancient times, and so far as these related to the presence of ancient man in this part of the world, it would be their duty to place them on record. Among other things which rendered the present time particularly opportune for the Society was the formation of the ship canal. With such an amount of delving and dredging as undoubtedly would take place if Manchester was made into a port, there would in all probability be some fine pickings for them. It would be their business to take hold of these pickings and make the best of them. He need hardly impress upon them the necessity of doing now such work as the Society had cut out for itself. The value of it would appear when they considered the value they would have put on similar labours on the part of a society three hundred years ago. If such a society had then existed in this part of the world they would now have the materials of a social history of those times which would give them a picture they now sought for in vain in the records of those times. The pickaxe and the shovel were most important aids to the pen of the historian. As showing the continuity of things, he pointed out that the present distribution of the sees in this country were to a large extent on the lines of the ancient realms of the Angles and the Saxons; parish boundaries were dependent to a large extent on the ancient manors; and as to roads, he mentioned that the road from Manchester to Stockport runs on the same general lines as the old Roman road from Mancunium, and the Roman roads to the present day were the main arterial branches of road travel. The headquarters of the Society offered great advantages. There was, indeed, so much to be done in Lancashire, Cheshire, and adjacent parts that he for one would be glad to see similar societies growing up in neighbouring towns. There was plenty of work for all, and the only result of rivalry would be the production of better work for the historian. Their particular line of work would lie in the direction of old houses, old churches, and mediæval buildings of various sorts, and they would ultimately land themselves in the most anciently historical time of all in this country—the Roman time. And in what part of the country, except perhaps in York, was there to be found a better illustration of the Roman time than in Chester? Their work would also deal with discoveries relating to times even more ancient, and they would in this field no doubt be able to do something which would not be unimportant to the future historian of this part of the world.

Mr. John Evans said he had been asked to speak of the four different ages into which human progress had been divided—the early stone age, the ordinary stone age, the bronze age, and the iron age. Looking, however, at the wide range which the Lancashire and Cheshire Antiquarian Society would occupy, he assumed

he had better take the divisions as Shakespeare took the ages of man, and speak of their acts as being seven ages. The first would be the early river drift age, known as the ancient stone or paleolithic age, which embraced the age of the caverns; the second would be the surface stone period—the period when polished stone implements were in use; the third age would be that of bronze, that being the principal metal used for making tools; the fourth would be the age when iron began to be used; the fifth would be the Roman, the sixth the Saxon, and the seventh the Mediæval period. He would not suppose—he remarked *en passant*—that in the present day we had in any way come to that stage which Shakespeare described as the last of the ages of man. Mr. Evans proceeded to descant on the characteristics of the different ages which he had enumerated, illustrating his observations by diagrams. In concluding, he urged the advantage of antiquarian researches as a relaxation from the pressure of business or professional life, and expressed the hope that the Society would go forth and prosper as one of the servants of that mistress of man's life, grave history, and that all might find pleasure in fully appreciating the proper titles by which she was known—Time's witness, herald of antiquity, the light of truth and life of memory.

THE DUBLIN MUSEUM.

THE following letter has been addressed to the President and Council of the Royal Dublin Society, suggesting the use of Irish stone in the proposed museum and library:—

My Lords and Gentlemen,—In consequence of the general desire entertained amongst members of the Royal Dublin Society and others that Irish building and ornamental stones should be largely (if not exclusively) employed in the buildings to be erected for the National Library and the Art Museum, it has been suggested to me by some members of the council to draw up a statement for your consideration on this subject. If I am correctly informed, the Board of Public Works are to be empowered to issue tenders and specifications, not only for a new national library to be erected on the north side of the court of the society's house, but for fresh designs for an art museum on the south side, extending to Kildare Place. There will thus be a great opportunity, not likely soon to recur, for utilising to the best advantage the building and ornamental stones which Ireland is capable of supplying.

I may here be allowed to draw attention to the fact that in the galleries of the Royal College of Science in St. Stephen's Green there is to be found a carefully-selected series of specimens of Irish building stones; while specimens of the marbles and other ornamental stones of this country are to be found in other parts of the building. An examination of these specimens, which originally were prepared for the Museum of Irish Industry, will suffice to prove how rich is this island in almost every description of material used in building, with the exception of those varieties of light-coloured oolite limestone which are only to be found in the Jurassic and Permian formations of England, France, and other parts of the Continent.

Experience, however, goes to show that the light and porous limestones of this class are ill-adapted to withstand the corroding influence of the atmosphere of large towns; and we may, therefore, assume that they will not be employed in the erection of the contemplated buildings. As this country is well supplied with light-coloured crystalline limestone from the carboniferous formation, and with white, yellow, and reddish sandstones from this and other formations, there will be no necessity for going outside its limits for a building stone both agreeable in appearance and suited to withstand the effects of a gaseous atmosphere. I will here assume that in the construction of the contemplated buildings brick and terra-cotta work will not be used for exterior work. Were these materials to be employed in a city already painfully overcrowded with brick houses, they would have to be imported to a large extent from England or elsewhere, and, in such a case, the opportunity for using Irish building stone would be lost. Thus far, as regards stones for the projected museum and library. As regards marbles and decorative stone, such as serpentine, it is scarcely necessary for me to do more than allude to them here. In marbles, of red, mottled, blue, brown, and black shades, this country is specially rich; while the green serpentine of county Galway (Connemara) forms an exceedingly handsome stone for interior decorative work. Of the beauty, variety, and capabilities of these marbles anyone may satisfy himself by a visit to the new museum of Trinity College.

Of grey granite we have an abundance in the neighbourhood of Dublin itself, and of red granite, similar to that of Peterhead, there is no lack; but, unfortunately, the districts where it is to be found are in remote parts of the counties of Galway and Donegal, and, as far as I have been able to ascertain, there is not, I regret to have to state, a single quarry at this moment being worked. In reference to this subject, I enclose a copy of a communication from the managers of Messrs. Richardson & Co., of Bessbrook, who some time since opened a quarry in the red granite of Barnesmore, county Donegal, but which has since been closed, a circumstance much to be regretted. It is a remarkable circumstance

that the construction of the West Donegal Railway, which was calculated to bring the Barnesmore quarry into communication with the north and centre of the country, should thus far have been the cause of the stoppage of work at the quarry itself, as blocks cannot be hewn and rolled down the side of the mountain without injuring the railway. It is to be hoped that this obstacle may ultimately be overcome.

It is unnecessary for me to enter into further details regarding the character of the various stones used in construction of buildings which Ireland supplies. Doubtless the Board of Public Works and the architects who may enter into competition for designs are well informed on the subject. But as we have seen, in the case of paving sets, now so largely used throughout this city, Ireland is heavily weighted in her endeavours to compete with England and Wales even in the case of those materials which she possesses in abundance. Into the causes of this I do not propose to enter further than to express my opinion that the fault is in some measure at least attributable to want of enterprise and perseverance on the part of our own people, and to the excessive rates charged by railway companies for carriage. In the case of building and ornamental stones, however, we need fear no competition if proper care be taken to see that Irish materials get a fair chance. In throwing out these observations, it is only with the intention of suggesting to the council to take such steps as the members may think fit for strengthening the hands of the Board of Public Works in carrying out a purpose which we may well presume it cannot be doubted the heads of that department themselves desire—viz., to give a preference in the specifications for the new buildings to the use of Irish materials. If this be done our purpose will be accomplished, because the architects and contractors will, in that case, take care to prepare their designs accordingly.—I have the honour to be, your most obedient servant,

EDWARD HULL,

Director of the Geological Survey of Ireland.

A copy of the letter has been sent from the Dublin Society to the Commissioners of Public Works, suggesting that Mr. Hull's recommendations may be carried out when instructions are given to the competitors.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE annual general meeting of this Society was held at the Royal Institution, Colquitt Street, on Wednesday evening, May 2, the president, Mr. William Parslow, F.R.I.B.A., in the chair.

The prizes for work done during the recess of 1882 by members of the Sketching Club were distributed; the silver medal of the Society was awarded as first prize to George Hornblower, and the second prize, of books, to James B. Hinks. Mr. Hinks was also awarded the first prize in the students' competition for work done by student members with the Sketching Club, and prizes for merit were obtained by Messrs. J. H. Dawson, Richard Holt, J. M. Knott, J. H. Phillips, and J. H. H. Sutton.

A discussion then ensued with reference to the desirability of removing to more central and commodious rooms, where all the advantages of a club could be obtained, and where students' and draughtsmen's "mutual improvement classes" could be held on ordinary evenings.

The subject was ultimately referred to the council for further consideration.

The annual report of the council and the statement of the hon. treasurer were then read, from which it appeared that the Society had a balance of nearly 200*l.* to its credit in addition to 121*l.* owing for subscriptions.

The council for session 1883-4 having been elected, the president delivered his closing address, which, owing to the unusual length of the preliminary proceedings he was compelled to curtail considerably. In the course of his remarks he touched particularly on the dangers and disadvantages of the continually-increasing overhead telephone and telegraph wires, giving it as his opinion that the time had arrived for dealing comprehensively with this matter by some system of general underground channels for the reception of gas and water-pipes, &c., and wires of all sorts. Mr. Parslow alluded also to the present unsatisfactory condition of architectural competitions, expressing a hope that the whole question might be shortly authoritatively dealt with.

The usual votes of thanks to the president and officers of the Society having been put and carried, this terminated the business of the meeting.

The Canadian Railway Department, in the year ending June 30, 1882, completed a length of 270 miles of new lines, the aggregate length of lines in operation there being 7,530 miles; 539 miles of line were laid, though not yet in operation; and 3,189 miles were in course of construction.

The Excavation on the foundation of the pedestal for the colossal statue of Liberty in New York Harbour has been commenced. The excavation is to be 64 feet square, and the pit is to be filled with concrete 15 feet deep. The committee engaged in raising funds have 100,000 dols. and expect to receive more.

Old Meeting Trust, Birmingham.

SIR,—It was Mr. Worthington's desire that his report should be considered "confidential." Hoping to be materially assisted in coming to a just decision on the merits of the designs submitted, the Trustees first asked Mr. A. Waterhouse, then Mr. J. L. Pearson, to act as assessor, but ill-health prevented, and then Mr. Thos. Worthington was called in. His report was not considered satisfactory by some of the Trustees, and was only adopted after several hours' discussion.

The gentleman whose work he placed first has remodelled his designs in several important points, and it is now considered very satisfactory, but there is a feeling on the part of some of the Trustees that the result of the competition has not been the adoption of the best design, and it is not very surprising that some of the competing architects should feel aggrieved.

I am, yours, &c.,

ONE OF THE TRUSTEES.

SIR,—The "friendly little paragraph" to which Mr. Worthington refers in your last issue is not at all flattering to himself, for thereby he is advised to act as the "military officer transformed into a judge, and give his decisions boldly, but under no circumstances to explain how he arrived at them." It may be O'Connell had no trained lawyer at hand, and therefore was obliged to fall back upon one whose decisions could not be supported by legal argument. Unfortunately, in consequence of ill-health, neither Mr. A. Waterhouse nor Mr. J. L. Pearson could undertake the duty of assessor, so the trustees fell back upon Mr. Worthington; but neither they nor the competing architects supposed for one moment he would act as O'Connell advised his military officer. Such advice may be all very well when a man of necessity holds a post he is not suited to fill; but surely in the case of a decision involving, not alone mere matters of taste, but points capable of being judicially compared with definite conditions previously laid down, the assessor's report should be at least supported by fair argument, and be correct in its statements. Such not being the case in Mr. Worthington's report, there is just cause for complaint, and we fail to see why, because Mr. Worthington desired his report to be considered "confidential," it is not open to discussion. The future of English architecture depends to a great extent upon the judgment of assessors, to say nothing of the injustice, and consequent loss, to competing architects when the assessor's duties are improperly performed; and it is but right they should fear their position "will become intolerable" if a sense of justice does not prompt them in the work they undertake. We hold that in all cases the assessor's report should be published as soon as the promoters have made their final selection; and we challenge Mr. Worthington to publish his, in order that the public may see whether or no we are simply "disappointed competitors," bent on worrying him because he has not awarded either of us the place of honour.

We remain, your obedient servants,

FOUR OF THE COMPETING ARCHITECTS.

LEGAL.

High Court of Justice (Queen's Bench Division), May 3.
(Before Mr. Justice DENMAN and Mr. Justice HAWKINS.)

OSBORN v. JACKSON.

This case was an appeal from a county court, raising a question of some nicety under the Employers' Liability Act, which in one of its sections gives a workman the right to recover where he has been injured by the negligence of any person who has any superintendence intrusted to him while in the exercise of such superintendence. The plaintiff was employed upon a building which was in process of being pulled down, and was working on the basement floor. Above him were two galleries, seven or eight feet apart, and as the foreman was passing a plank from one gallery to a man stationed in the other the end which the foreman had hold of slipped out of his grasp and knocked away a piece of shoring, which fell on the plaintiff below and injured him. The foreman, who was called as a witness, said he was acting as superintendent, and that his duty was to see that the workmen did not harm each other. He called the workman on the opposite gallery to take hold of the plank, and the man did so, but before his hold of it was sufficiently firm the foreman let his end go, and so the accident happened. The county court judge held that there was negligence under the Act by the foreman, as superintendent while in the exercise of his superintendence, and the plaintiff obtained a verdict for 50*l.* It was argued that this verdict was wrong, and that the negligence of the foreman was that of a mere volunteer, and quite apart from the exercise on his part of any superintendence. Mr.

Justice Denman was of opinion that the county court judge was right. When the foreman called out to the workman he was clearly acting as superintendent, and he was not the less guilty of negligence in that capacity because he was doing some work which, strictly speaking, he need not have done. There was no case to show that because a superintendent put himself in the position of a workman and gave an order to another workman he ceased to be a superintendent. He might take part in the work and at the same time retain his character as superintendent. There was evidence at least to prove that the foreman here was superintending, and he was of opinion, therefore, that the verdict should not be disturbed.—Mr. Justice Hawkins delivered judgment to the same effect.—Counsel pressed for leave to appeal, but the Court were of opinion that the Legislature contemplated that cases of this kind should be finally decided by a Divisional Court, and refused the application.

ARCHÆOLOGY.

St. Martin's, Canterbury.—Canon Routledge has been examining the architecture of the old Roman church of St. Martin. He has found that the plan of the building as it existed at the beginning of the fifth century was probably exactly like what it is at the present time—similar, in fact, to the churches at Killaloe and Boardhurst. "The wall of the nave is built in regular courses of Roman brick, the wide intervals between these courses being filled up with Kentish rag and rubble. This wall is coated internally with Roman plaster, made of pounded brick. The chancel is built of Roman bricks laid closely and evenly on one another, with no signs of Roman plastering. Looking to these different styles of building, I am inclined to hazard the conjecture that the nave was an old Roman villa or temple, which was turned into a church (somewhere about the end of the fourth century), by the addition of the chancel. I hope, at no distant date, to examine more closely the west walls both of the chancel and the nave. The square opening at the south-west corner of the chancel was six feet high. I have very little doubt myself that it is a Roman doorway. Supposing the semi-circular-arched opening near it to be also of late Roman date, we may refer for the occurrence of square and semi-circular doorways in the same building to the instance of Jublains, in the department of Mayenne, to which Mr. Roach Smith has called my attention. I may take this opportunity of recording the fact that the so-called 'Queen Bertha's tomb' in St. Martin's was opened on January 12, 1883. Beneath the covering slab of oolite a coffin of stone was discovered, hollowed out into the shape of the body, and having a small semicircular opening (about 9 inches in diameter) for the head of the corpse. This opening had been bricked off from the rest of the tomb, probably when the tomb was last opened in 1844, and was thus made into a receptacle for fragments of bones and other human remains. The rest of the stone coffin was filled up with flints, bricks, and rubbish. The bones were pronounced by a surgeon who was present to be probably those of an elderly man, about seventy, of small proportions. This opinion would harmonise with one which I had previously broached—that the tomb is probably that of the restorer of the church, about the end of the thirteenth century. I may add that Mr. Brock is mistaken in saying that the bones discovered in the curious leaden wrapper at St. Pancras were those of a child; they were clearly proved to be the bones of a full-grown person; and, as the leaden wrapper only measured about 2 feet 6 inches in length, it is probable that the coffin contained the relics of some saint or other distinguished person, which had been collected together and placed in a specially sacred part of the church, as close as possible to the walls of the actual edifice."

CHURCH BUILDING AND RESTORATION.

Wigton.—A new Wesleyan chapel has been opened. The building has been erected from the designs of Mr. W. Ranger, architect, London, in Fauldsbrow stone, with red stone facings and stone from Shawk quarries. The contractor was, for the whole of the work, Mr. W. Forster, of Wigton. Sub-contractors: mason, Mr. Jos. Moore, Wigton; slater, Mr. Jos. Fell; and plumber, Mr. R. Twentymen, Wigton.

Chedworth.—The church of St. Andrew has been reopened after works of reparation, carried out from the plans of Mr. F. S. Waller, architect, by Mr. James Clutterbuck, builder, of Gloucester. The cost of the work has been about 1,600*l.*

Northleach.—The work of restoring the church at Northleach is to be commenced. The estimated cost of the work amounts to about 3,500*l.*, and will be executed in two sections. Mr. Brooks, London, is the architect.

Midgley.—The memorial-stone of a Methodist chapel has been laid. The building is being erected from the designs of Messrs. T. Horsfield & Son, architects, Manchester. The contractors for the work are—mason, T. Pickles, Midgley; joiner, E. Marsland, Booth; slater and plasterer, J. Alderson, Luddenden; plumber, J. Alderson, Luddenden Foot; and painter, H. Uttley, Hebden Bridge.

NEW BUILDINGS.

Aberdeen.—The market buildings, which were burnt down a year ago, have now been opened after reconstruction. The works have been carried out from the plans of Messrs. W. & J. Smith, architects. The contractors were: Mason work, James Willox; iron roof, P. & W. M'Lellan, Glasgow; carpenter work of roof, John Henderson; roof-light glazing, Rendle & Co., London; slater work, Alexander Adam; plumber work of roof, J. Blaikie & Sons; gas-pipes and fittings, J. Blaikie & Sons, water-pipes, &c., Gunn & Elder; gallery fireproof floor, Homan & Rodgers, Manchester; plaster work, James Bannochie; ditto gallery shops, Stephen & Campbell; scaffolding, and carpenter and joiner work of butchers' shops and gallery shops, James Garvie & Son; gardeners' benches and seats and tables for butter and egg sellers, Watt & Clark; iron bars and hooks and ironwork for shops, Harper & Co.; steam heating, H. Purnett, Glasgow; painting roof and shops at Hadden Street, &c., J. & S. Fyfe; staining and varnishing and glazing gallery shops, G. Donald; glazing gallery windows, W. Slaker; granite fountain, J. Fraser & Son.

NOTES ON NOVELTIES.

A New Safety Hoist.—Mr. John Stones, of Ulverston, has patented a new safety hoist. The principle on which it is designed is as follows: Revolving shutters or sliding doors form the sides of the cage, or hoist, and are made to coil above automatically. When the cage is down the shutters are coiled on their respective rollers above the opening, and immediately the hoist begins to ascend or descend, the shutters ascend or descend, and close the openings before the cage is clear of them. When the cage reaches the floor at which a stoppage is desired, the sliding doors are lifted above or below the openings. The cage is thus completely closed except when it is on a level with the floor at which it stops, and thus the dangers caused by the hoists at present in use having doors which shut by hand and which are liable to be left open, with resultant loss of life or limb, are entirely obviated. The invention can be applied to any number of openings on the same or different floors. The apparatus can be worked by hydraulic, steam, gas, or hand-power; and the shutters may be applied to one side or all the sides of the cage.

GENERAL.

Mr. James D. Linton has been elected vice-president of the Institute of Painters in Water-Colours, in place of the late Mr. W. L. Leitch.

Mr. J. E. Christie has sold his picture *Tam o' Shanter*, which is in the Royal Academy Exhibition (No. 359) to the Public Gallery, Melbourne.

Chapelthorpe Church, which is to be opened on Wednesday, has been fitted throughout by Messrs. Jones & Willis.

The Bromsgrove Local Board on Tuesday decided to carry out the plans of Mr. John Cotton, of Birmingham, for a proposed public swimming-bath.

Plans for public baths and wash-houses, Elswick, Westgate, and Byker, Newcastle-on-Tyne, have been prepared, the estimated cost of each of the three blocks being 7,000*l.*

An Amateur Water-Colour Exhibition was opened with a conversazione at the Liverpool Art Club, on Tuesday.

The Manchester Cathedral Restoration Fund now reaches between 19,000*l.* and 20,000*l.*

The Exhibition of the Royal Scottish Academy closes to-day (Saturday). The large number of the public who have visited the exhibition testifies to its merit.

Electric Lighting has been permanently adopted at Chesterfield, the cost being less than that of gas lighting.

The Chantrey Bequest Purchases this year are, Mr. W. L. Wyllie's *Toil, Glitter, Grime, and Wealth on a Flowing Tide*, and Mr. Joseph Farquharson's *Joyless Winter Day*.

The Kirkwall Town Council have approved of plans by Mr. T. S. Peace, architect, for the proposed new town-hall, post-office, and municipal buildings. The building is estimated to cost about 4,000*l.*

The Municipality of Singapore have asked Major-General Sir Andrew Clarke, K.C.M.G., to select and send them out a chief engineer. Salary, 1,000*l.* a year. Candidates should send their applications with testimonials addressed to Whitehall.

A Section of the new street from Cannon Street to Trinity Square, between Mincing Lane and Mark Lane, part of the improvements in connection with the completion of the Inner Circle Railway, was opened on Tuesday.

Municipal Offices, with accommodation for the whole of the borough officials, are to be provided in Babington Lane, Derby, at a cost of 3,250*l.*, as the present and contemplated expenses of the borough render the erection of a town-hall out of the question.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MAY 12, 1883.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

ELGIN.—May 31.—Plans and Designs are wanted for Town Hall proposed to be erected. Mr. David Forsyth, Town Clerk, Elgin.

GORLESTON.—May 19.—Plans are invited for the Erection of Board School, with Boundary Walling, on the Danby Estate, to accommodate 275 Boys, 275 Girls, and 250 Infants. Mr. C. H. Wiltshire, Clerk to the School Board, 12 South Quay, Great Yarmouth.

HAVERFORDWEST.—May 31.—Plans and Designs are invited for a Public Slaughter House, &c. Mr. Henry Davies, Town Clerk, Haverfordwest.

NEWCASTLE-ON-TYNE.—July 4.—Designs are invited for a Police Station and Fire Brigade Station to be Erected on the site of Westgate Police Station. Mr. Hill Motum, Town Clerk, Town Hall, Newcastle-on-Tyne.

YEOVIL.—July 1.—Designs are invited for Swimming Baths, &c. The Borough Surveyor, Yeovil.

CONTRACTS OPEN.

ALVERSTOKE.—June 4.—For Further Works in Church Restoration and Enlargement. Rev. W. Durst, Alverstoke Rectory, Gosport.

BATH.—May 12.—For Building Semi-detached Villas and Cottages. Mr. C. E. Davis, F.S.A., Architect, 55 Pulteney Street, Bath.

BELFAST.—May 14.—For Extension of Goods Sheds, Donegall Quay. Mr. William Thompson, Harbour Office, Belfast.

BRADFORD.—May 19.—For Building Block of Warehousing. Messrs. Milnes & France, Architects, 99 Swan Arcade, Bradford.

Pearcey, Poole	2,434 17 9
Clarke, Parkstone	2,317 0 0

As the whole of the funds might not be at once forthcoming, the committee decided to take the work in sections. No. 3 comprises the whole work—the additions to west front, with tower and spire complete. No. 2 comprises the additions to the west front, and a portion of the tower; and No. 1 comprises the additions to the west front and the whole of the tower and pinnacles, leaving the spire.

The committee have decided on accepting Mr. Pearcey's No. 1 tender, but reserve to themselves the right, by giving him notice within a certain time, to call upon him to complete the whole work, in accordance with Tender No. 3.

LUDLOW.

For Building Infirm Wards, Mortuary, &c., at the Ludlow Union Workhouse. Mr. JAMES HINE (now in Africa), Architect. Mr. Kilby, Master of the Workhouse, Surveyor and Clerk of the Works. Quantities not supplied.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK.
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13. 14 & 15 SOUTH WHARF, W.

The Architect.

SANITARY LITIGATION.

ANOTHER of those cases in which the owners of houses are now being held liable to tenants for the unhealthiness of their property was decided some ten days ago. The litigation took place, it is true, only before a County Court; but it was in the Court of the City of London, which ranks as the chief tribunal of the kind in England, and which is presided over by a

gentleman who is well known for what is called a "strong" judge, one who forms his opinions with such confidence, and expresses them with such vigour, as to indicate a good grasp of the first principles of law, and none the less a firm reliance upon the common sense of justice. Mr. Commissioner KERR on this occasion had before him a claim preferred by a small landlord against a small tenant for a small sum of money in respect of rent. The tenant set up a sort of haphazard counter-claim of about double the amount, which was based chiefly, or perhaps altogether, upon the allegation that the house was in an unwholesome condition of drainage, and had to be vacated for that reason. The result of the action was that the judge found for the defendant on both issues; that is to say, he gave the landlord nothing for the rent due, but, on the contrary, awarded damages against him for the unsanitary state of the house. Moreover, he accompanied his decision with a few very pertinent observations after his manner. He said he would have been ready to allow the tenant much larger damages if they had been claimed, because no one could tell what injury, present and future, might arise from living in an unwholesome house, and it was high time that landlords were taught that property had its duties as well as its rights. We presume the Commissioner is not an investor in houses; but so much the better for the case, inasmuch as we conceive the meaning of such a judicial decision to be that the Courts of Law, representing the interests of the great majority of the people, who are not rent-receivers but rent-payers, will be found disposed to put upon the shoulders of the whole class of rent-receivers the burden of warranting the houses to be healthy for which they receive rent. Of course there cannot be any objection to this provided the principle be clearly understood, but it is becoming at any rate highly desirable that the understanding should be much clearer than it is.

The fact no doubt is that the drainage of most of the dwelling-houses in towns, which the people at large occupy as rack-rent-paying tenants, may be said to be more or less defective; and the causes which have brought about this condition of things, although frequently explained to the public of late, will require a great deal more exposition before they are fully appreciated. So imperfectly, indeed, are they appreciated at this hour, that even a judge upon the bench, called upon to deal with the question responsibly, has very likely no more distinct idea of a drain than that it is something nasty out of sight, which ought to be kept clean, and which smells if it is not kept clean. As for the ordinary intelligence of the people, it is questionable whether it ever reaches further than the mere superficial circumstance that a pail of dirty water poured down "the drain" disappears for ever, sinking perhaps perpendicularly into the stomach of the planet. To them the "smell" of a drain, therefore, is a sort of emanation from the nether world; and, if it is in some way or other an unwholesome emanation, it is so because it naturally would be so. At the same time, the unwholesome nature of the "smell," be it observed, is not by any means an accepted thing; many thousands live and die in it and never complain; they cannot afford to be fastidious; perhaps it is worse to those who are not used to it; perhaps the smell itself is getting worse.

Let us put the case once more in a familiar way, therefore, and it is simply this: If we are to have underground pipes by which our refuse flows downwards and away from the house, no matter where, it cannot but follow that any gas which may be evolved from that refuse shall pass by the same pipes upwards and (if it can find entrance) into the house again. This is the whole mystery. The "smell," however un-

pleasant it may be to noses polite, is the least of it. We lead dirty water out of the house; by the same channels we lead dirty air into the house; and it may happen that this air—we call it by the very convenient name of *sewer-gas*—shall be rank poison. Sanitary drainage, therefore, is, in a single word, the leading out of our dirty water without leading in the dirty air. The worst of it is that this dirty air is not our own, or, indeed, our neighbours' dirty air; even this poor consolation is denied us; it is the foul air of the nether world truly enough; it belongs to nobody in particular, to nobody even in general except the owners of the sewers. People's drains run into those sewers quite innocently; it is the sewers that cause the foul gas to be generated, not the drains; the "smell" is produced altogether off the premises, perhaps a mile away; and the real mischief is that, as sure as the drainage flows down, so surely the sewer-gas flows up the same channel, and so we cannot get rid of the one without taking the other in exchange.

This being so, and the obviously necessary ventilation of the sewers being somehow confessedly impossible for the present (this seems to be the plainest way of putting it, however pitiful the confession may be), it follows that it is an especial duty of somebody's to prevent the entrance of the sewer-gas into the house; and, speaking in a practical way, if the sewer-gas is becoming more poisonous, or if the inhabitants of our towns are becoming more easily poisoned, or if, to say no more, we are getting to be better informed about the matter, and merely on that account more sensitive, the common law of England (which has a remarkable way of adapting itself to circumstances as they arise) will inevitably meet the case in one way and not another. That is to say, if a house is found to be what the law regards as uninhabitable by reason of its being pervaded by sewer-gas, the Courts will lean towards the protection of the tenant's health rather than the protection of the landlord's rent. For health is life, while rent is only profit; and between a dead tenant and a diminished profit, it is needless to ask which side must be most identified with the interest of the public, if only as the greatest good or least evil of the greatest number. Upon any such line of reasoning, obviously, the judicial mind will, indeed, as the question develops itself, only more and more distinctly discern, as a principle of public morals, that an agreement to pay rent for the use of a house involves the condition, whether expressed or not, that the house shall be usable, and above all things usable with reasonable confidence in respect of health. The chief ground for anxiety, however, is that the application of such a principle by our judges, and by our juries under their direction, may very possibly take such a form as to produce a serious effect upon the value of house property. In fact, it may at one and the same time lower the selling price at the expense of the owners and enhance the rental at the expense of the tenants; but this point we cannot now discuss. For the present we can only advise all house proprietors to inquire carefully into the sanitary state of their property, and all tenants who are entering upon new occupations to be equally anxious upon the same subject, and so see what comes of it.

Putting the case broadly, there are two considerations to be regarded. The first is that the communication which in all probability exists in the most direct form between the house drainage and the public sewer shall be cut off. This is easily done, although generally supposed to be impossible; for example, a small receiver may be interposed underground and specially ventilated, besides being trapped, and the thing is done. The second point is that the house drainage itself shall be so far clean, together with the ground about it, that there shall not be any generation of foul gas within the limits of the house itself. This also is easily managed so far as science goes. In some cases the drain under the house is rotten and leaky; if so it must be renewed and the polluted earth taken out. Sometimes a ventilation pipe is wanted, which is never a very difficult matter. Frequently it will be found, no doubt, that the plumbers are here and there at fault, and it must be rectified. In almost all cases, if a little intelligence be brought to bear upon the facts, we may say that the ordinary drainage of ordinary houses is capable of being put to rights with much less expense than is generally supposed, whether it be undertaken by landlords or by tenants; and again we do not at all hesitate to advise our readers of both classes to inquire forthwith whether it is necessary, and, if so, how it can be done.

One of the difficulties in which the Courts of Law may presently find themselves involved is the question how far leasehold tenants are to be expected to renovate the drainage

of the houses they occupy at rack-rents. This indeed opens a much wider question which may be said to be at this moment gradually rising into importance, namely, the liability of a leaseholder for the renovation, at whatever cost, of the structure itself when condemned by a public authority for reasons which go back beyond the beginning of his lease. In a word, when the bargain between landlord and tenant has been made under the impression on both sides that the house was a sound house, who is to bear the sometimes very serious loss when it is discovered to be an unsound house? For the present, what with "surrendering clauses" which were never meant to have any interpretation at all, and refined interpretations of "mere forms" which ingenious lawyers produce to order as they are wanted, with judicial precedents, like the rest, all turning upon words and not things, a poor tenant is being told plainly that he must replace falling roofs, rebuild rotten walls, chimneys, parapets, and so on, almost to an unlimited extent, even if the result should be that he gives his landlord what is virtually a new house for an old one—and literally so if the house happens to have been so decrepit as to be blown down bodily, for instance, by the wind. Compared with the cost of such renovations as these, that of renewing the drainage may be a bagatelle; but if we should find, as seems to be the case, that the public generally are becoming so seriously alarmed about drain-poisoning in particular as to threaten frequent litigation, we cannot do better than repeat once more our recommendation to all interested parties to look the question fairly in the face, and the sooner the better.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

AFTER dealing with the most conspicuous drawings in the remarks which we published last week, it remains for us to-day to consider those which form the bulk of the collection; or at least as many of them as require notice. When we turn to this part of our duty, the disappointing character of this year's exhibition becomes obvious. The result of pursuing chiefly a debased, if a picturesque, style has not unnaturally been to introduce license as well as freedom and wildness quite as much as pleasing inequality into the work of many of our architects. Accordingly, though we find undoubtedly some excellent designs, we are constantly confronted by very irregular and unstudied features, especially in the domestic buildings exhibited, and we are driven to doubt whether such movement as is being made is not in a wrong direction.

Taking the works for the most part in the order of the catalogue, the first to attract notice is the *Mission House, Guernsey*, exhibited by Messrs. NOTLEY & TROLLOPE (1,121). This group of buildings, irregular to some extent, but well contrasted, shows a good result achieved by simple means; the only feature that can be called an ornamental addition being a modest but successful tower, with a pyramidal stone roof. No. 1,122 is a painstaking study of the *Beauchamp Chapel, Warwick*, by Mr. F. W. RICHARDSON, to which we are glad to direct attention; but we shall have to pass most of the remaining studies without notice, not on account of their want of merit, but in order to reserve the space at our disposal for works illustrative of the architecture of the day. Mr. MAY exhibits a frame of houses at Bedford Park (1,123), drawn with the same rapid execution to which we have already referred. The interior sketches are the best in this frame; but in the *New Hotel, Bush Hill, Enfield* (1,183), the same architect shows a really well-designed exterior, with on the first floor a large overhanging bay window, and below, the entrance door, with a bold shell ornament over it. Mr. NORMAN SHAW's large drawing of a house in Cadogan Square (1,124), bearing the name of G. HOCKLEY as the draughtsman, hangs near. In this building everything is long drawn out, and tall, the masses of the building, the windows, the high chimneys—each and all contribute to the effect of tallness and narrowness. Still, being the work of an architect who never entirely fails to extract good effect even out of most unpromising materials, there is something good about this building; but it will add nothing to its author's reputation.

Two frames, hung side by side, and occupied by drawings in a facile style, next attract notice. In *The Quinto Sunday-school* (1,130) Mr. DAVISON shows at once his skill as an architect and as a draughtsman. *The Church at*

Tonga (1,129), the work of Mr. R. K. FREEMAN, is illustrated in the same manner by Mr. DAVISON. The drawings are vignettes, and the prettiness of the handling leads us to excuse here and there a certain amount of indecision in the outline, and it is quite possible the architecture, if drawn in a more commonplace way, might not prove quite so attractive. This style of drawing is quite sure to have imitators, and we trust that those who take it up will not allow slipshod work to creep in under the cover of prettiness of touch and rapid execution. No better antidote, if one be needed, could be offered than the carefully-executed workmanship of the clear and faithful yet spirited drawing in which Mr. T. E. COLLCUTT shows a house to be built at Hayes Common (1,131). The building is half-timbered with many gables, the upper floors overhang, and the proper treatment of the style adopted is well understood. We hardly think, however, that the entrance-porch is marked enough, or that the chimney at one side of one gable in the background is happily introduced.

Mr. INGRESS BELL is less successful than sometimes in his *Residence near Whitby* (1,132), a castellated house almost without windows, though well grouped.

Mr. EDIS, who often exhibits good domestic architectural work, is only represented in this part of his practice by a modest contribution, a tasteful but not extensive addition to a very commonplace house (1,134). Mr. EDIS also exhibits *A Memorial Church and Mausoleum* (1,218)—a bird's-eye view of a small church with a tiny kind of cloister and a lych-gate; the whole solemn and appropriate in design, and extremely well shown.

Collyers, near Petersfield (1,135), by Messrs. BATEMAN and KEATES, has obtained the good place in which it hangs more in virtue of the tinting, which is good, than of its design, which is erratic. *The City of London School* (1,136), by Messrs. DAVIS and EMANUEL, on the other hand, deserves, as representing an important building recently erected, a much better place than it has. This building has narrowly failed of being a complete success, but the design of the open turrets and some other portions does not harmonise well with the general vigour of the great arcade which forms the principle feature, and there are other deficiencies; still, as a whole, this school is a very creditable addition to the public buildings of London, and, as such, one of the most interesting contributions to the collection. Mr. GEO. GILBERT SCOTT exhibits the geometrical section and side elevation of a *Church at Norwich* (1,137), but adds no plan. The drawings are not specially appropriate for exhibition purposes, and are accordingly hung out of reach.

Mr. HENRY HOLLIDAY sends a small drawing of the *Cavendish Memorial Window* and two full-size cartoons of groups (1,138, 1,140, 1,169). This is the most important among several designs for stained glass hung in this room. The cartoons, which depict scenes from the Passion of our Lord, are full of fine drawing, but they appear to us wanting in dignity and even in pathos. The artist has departed from the conventional method, which is the safe one, and seems not to have so managed the realistic treatment on which he has fallen back as to make it answer his purpose fully.

The Staircase (1,141) of Mr. MACARTNY is a well-tinted little drawing of a good Elizabethan design; near it hangs a drawing showing the lectern and choir fittings (1,142) added by Mr. JAMES K. COLLING to St. Peter's Church, Vere Street. This work is full of rich carving, somewhat in the manner of GRINLING GIBBONS, but more florid; as a whole, the additions produce a satisfactory impression. A more elaborate interior hangs near, the *Saloon of a Yacht*, by Mr. ERNEST GEORGE (1,147). This either is, or is made to appear, a very spacious apartment indeed. It has a fireplace and chimney-piece, and altogether, though it is cleverly treated and rich, it would not be thought nautical by sailors of the old school.

Several drawings of houses hanging in this part of the room may be taken together. They are by Mr. JOHN E. TROLLOPE (1,144), Mr. ASTON WEBB (1,148, 1,164), Mr. J. J. STEVENSON (1,149), Mr. T. E. COLLCUTT (1,152), Mr. ERNEST NEWTON (1,154, 1,162), Mr. RIDGE (1,159), and Mr. E. R. ROBSON (1,163). Mr. STEVENSON's contribution is called *Kensington Court*, and represents part of a London square, with gabled houses of the so-called QUEEN ANNE type, very varied, and not forming a harmonious whole; this drawing is hung too high to examine closely. Far better than any part of this group is Mr. ERNEST NEWTON's *House at Chislehurst*, a design of real merit. The house has a central gable overhanging a

rich arcaded entrance, overlooked by a pretty oriel on the first floor; part of the building is half-timbered, but the portion so treated is not introduced in a haphazard way, but contributes to the general air of studied design in the building. Mr. NEWTON's other drawing does not equal this one in merit. Mr. TROLLOPE's *House at Esher* is partly tiled on the walls, and otherwise rather bare and gaunt-looking. Mr. ASTON WEBB's *New Holme* is shown in a bright drawing, but is not very remarkable; his other contribution, *Brackenwood*, is more interesting and original. Too much relatively to the whole seems made of the upper storey, but the general treatment is satisfactory. Mr. COLCUTT's *Hunting Lodge* is, as its name imports, a modest building, and, as is usual with this architect, is of half-timbered work, well handled. Mr. RIDGE exhibits a dark drawing of *Vernon Chambers*, Bloomsbury—an attempt to deal with the difficult problem of treating town houses architecturally. The piers of the upper storeys are treated in a pilaster-like fashion, which adds a certain dignity to parts that are otherwise rather uninteresting. Lastly, Mr. ROBSON, who is always bent on giving a distinct character to his work, even at the expense of making it eccentric, sends a *Gentleman's Cottage*, a solid, unbroken little block of building, with a bold overhanging roof; the first floor is somewhat lightened by the introduction of half-timbered work rather timidly employed between the windows. The design has good points, and, as was probably desired, has little in common with the ordinary cottage *ornée*.

Mr. SCOTT exhibits the Iconostasis of a Greek church in Bayswater (1,160), a drawing full of Byzantine work, executed, so far as its position enables us to examine it, with learning and taste. The opportunity of producing a design of this sort does not often present itself in English practice. Mr. WALTER HENSMAN has, like Mr. SCOTT, had the misfortune to have his work skied; he contributes a large drawing of a staircase, but its boldness enables the general effect of what we presume is an academic study very fully worked out, to be appreciated. In *St. Leonard's, Perth* (1,168), Mr. J. J. STEVENSON has found a good subject, which he has handled well, and in a Scotch manner. He has designed a large church with an apse and a massive tower, surmounted by one of those eccentric tops which consist of four flying buttresses meeting, to carry a slight stone lantern. Mr. M. E. MACARTNEY contributes a forcible drawing of the rich Elizabethan interior of *Inglenook* (1,170), and Mr. E. W. POLEY an even more powerful drawing representing a hall and staircase (1,173) covered with decoration. The labour expended on this has been prodigious, with the result that, taken as a whole, the interior looks overdone and more busy than rich; yet each separate part, taken by itself, is full of good drawing and clever design. Mr. NEALE exhibits a house to be erected at Goring (1,172). Like much of the better sort of domestic work shown this year, it is half-timbered, but is strangely deficient in window openings—a defect for which the style adopted hardly affords an excuse.

We now reach the unusual and interesting subject exhibited by Mr. SEDDING, who contributes designs for two pastoral staves (1,175). These are fine specimens of goldsmiths' work, and fairly well shown. We like the simple design—that for the diocese of St. David's—the best, but both show skill and taste, and good knowledge of a class of work not studied by many architects. Mr. BRADE exhibits a competitive design for the rebuilding of the Sublician bridge in Rome, as a memorial to VICTOR EMANUEL (1,176), a necessarily academic but clever drawing, and with a good deal of freedom in treatment.

In the *New Chancel for Batcombe Church, Somerset* (1,184), exhibited by Mr. R. J. WITHERS, we have a good example of a powerful result attained by the judicious use of the simplest materials. These are literally no more unusual elements than a row of three rather wide lancet windows, surmounted by three more occupying the gable, the whole flanked by turrets with blunt tops, while from behind a modest fleche peeps out; yet the whole is so well-proportioned and grouped that it forms an excellent, and even forcible, piece of architecture. Another good piece of church work—this time an interior subject—hangs near; we refer to the *New Font and Font Cover at St. Mary's, Watford* (1,190), exhibited by Messrs. CHRISTOPHER and WHITE. The font is large, and consequently its cover is massive, which is to some extent a defect in a piece of furniture that has to be lifted and let down, but except this, which is not quite desirable, there is nothing to find fault with and much to praise in this carefully-designed and rich feature, shown as it is in an admirable drawing.

Two works by members of the Academy, to which we did not allude in our first article, are now reached. The first is a drawing of dining-room decoration (1,185) by Mr. GEORGE AITCHISON. Here we have a rather sombre tone of colouring, selected and carried out so as to produce a quiet effect full of dignity and repose. As usual, the drawing is exquisitely executed. To this succeeds Mr. WATERHOUSE's view of the *Turner's Memorial Buildings, Liverpool* (1,191), a group that is almost domestic in its character, as perhaps it ought to be, considering that it is intended as a home for chronic patients. The chapel and a modest circular tower, with a conical roof, are the two features which add a touch of dignity to the otherwise homely group.

Mr. ERNEST GEORGE contributes a bright sketch of a very simply-designed church to be built in the Engadine (1,192), a strong contrast to the drawing which, passing over some studies and drawings already considered, we next reach—Mr. J. N. JOHNSTON's *Newton Surmaville* (1,199), a highly-laboured representation of what we presume is a modern house. The architect has, however, succeeded admirably in making it look antique; three heavy gables, surmounted by chimneys, speak of vast chimney corners such as are not often built now, and a general compactness such as the modern artist often despises are elements in the composition which add a great deal of solid character. Much more elaborately broken up than the last-named house is Mr. BRYDON's *Lewins* (1,202), a somewhat laboured, picturesque design, not so successful as *The Agent's House* (1,203) by Mr. DOUGLAS, which succeeds it. The agent for whom this house is a suitable abode must be a very considerable personage, as a large French château, with great semicircular, bastion-like turrets flanking a high roof, has been designed for him, and a whole crowd of dependencies completes a busy domestic group. There is much easy handling and good treatment in this building. The same architect contributes also *A Gate House at Eaton* (1,236), florid, but rich and good, and with the same tinge of French feeling which *The Agent's House* displays. The drawings by Mr. HODKINSON are capital.

Mr. BASIL CHAMPNEY's *Girl's School at Bedford* (1,205) is a modest and rather inadequate representation of a really good Elizabethan building. Mr. SAXON SNELL's drawing hanging near it also gives but a poor idea of his *Hospital for Marylebone* (1,206), a building with good architectural features. This drawing is a bird's-eye view, and in a case where of course disposition of plan is of great importance, it was perhaps excusable to adopt such a method of representation, but it fails to do justice to the architectural merits of a building into which it is very difficult to impart anything beyond the most utilitarian treatment.

A Design for a College (1,209), well drawn by Mr. W. R. LETHABY, represents the joint work of Mr. MACARTNEY and Mr. E. NEWTON; it is in rather florid Elizabethan, and has some good points, especially the design of the central turret. Mr. SEDDING follows with a rather ambitious house (1,215), and Mr. CUBITT and Messrs. DUNN and HANSOM contribute specimens of church work. Mr. CUBITT's *Church for Edgbaston* (1,214) shows the exterior of a transeptal church with apse and apsidal ends to the aisles, surmounted by a large octagonal lantern over the crossing; Messrs. DUNN and HANSOM's is the interior of a striking *Monastic Church near Bath* (1,217), which deserved a much larger drawing. We see the vaulted transept of this church, and a side glimpse at the chancel arch reveals what appears to be a grand screen well worth further illustration. *Curriers' Hall* (1,221), exhibited by Messrs. BELCHER, is a rather florid interior of domestic Gothic, with a high *cheminée* richly carved. Near it hangs a large block of business premises to be built in Mayfair (1,224) by Mr. WIMPERIS, with many features closely packed together, producing an absence of repose. Mr. WITHERS exhibits (1,229) a bright simple church interior, much like those the late Mr. STREET used often to send. Mr. FOX sends the decorations of part of the library at Warwick Castle (1,228), treated in white, dark blue, and gold; and yet another house follows, one at Robertsbridge (1,234), combining semicircular arches, ogival arches, transomes, and half-timbered work into a whole, with which some of the features are a little incongruous. This is exhibited by Mr. W. H. OAKLEY. Last, we must not omit to mention the *Hall, Nether Court* (1,227), a good tinted drawing of an excellently-designed Elizabethan staircase and hall, thoroughly in keeping and nowhere overdone, the creditable contribution of Mr. PERCY G. STONE.

We have been obliged to pass by almost all the studies

from existing buildings, and (except in the case of Mr. HOLLIDAY) the designs for stained glass windows. In one or two instances, however, the studies deserve to be at least mentioned. Perhaps the most valuable is *Shaw House in Berkshire* (1,212), a fully-windowed, very symmetrical Elizabethan building of great dignity and sobriety of treatment, yet thoroughly bright and domestic. Three studies of Spanish architecture by Mr. BERNARD SMITH (1,196, 1,198, 1,200) are interesting on account of their subjects, and Mr. ADDISON'S *Norman Porch, Canterbury* (1,189), Mr. HORSLEY'S sketch of *St. Martha's Chapel, Guildford* (1,171), Mr. BAKER'S elaborate study of *Llanellidan Church* (1,165), and a cleverly-drawn bright study by Mr. H. A. MATEAR of a chimney at Hampton Court, are among the drawings of this class deserving mention. We ought not, also, to overlook two highly-finished sketches, one of a French subject by Mr. F. P. BARRAUD (1,178), and the other of *Wolverton House, Norfolk* (1,177) by that accomplished architectural artist Mr. G. R. CLARKE. These would be almost as suitably placed among water-colour drawings as here, but still as a specimen of studies which are not frequently made in the present day, they are welcome, both on account of their execution and of the subjects they represent.

A very few contributions, chiefly those so hung that it has been impossible to do justice to them, have been intentionally passed over in silence, but we hope that few drawings, if any, that ought to have been mentioned have been overlooked. We have already mentioned the generally unsatisfactory impression which the collection produces as compared with some past years. In conclusion, we have the pleasanter duty of pointing out that there is still much good draughtsmanship and some very satisfactory design to be met with in the Architectural room, and that our readers will find it will well repay a visit. As usual, however, this room is the least crowded corner of the whole suite of galleries.

THE PARIS SALON.—II.

M. DE VUILLEFROY, secretary of the jury, whose courtesy has much to do with the success of the exhibition, contributes two fine works, in one of which cows are pasturing, *Dans les Prés*, and in the other, *La Sortie de l'Herbage*, the same animals are seen descending the sloping side of a mountain, on which they have been turned out for summer grazing. It is early. The sun has scarcely dispersed the morning haze. The cows are hurrying down to water at the stream below. They are therefore foreshortened, and with admirable skill. A sense of fresh country-life is conveyed by both works.

Reminiscent of ETTY'S school—all colour and touch—is M. FRED. BONNAUD'S *Portrait of Mlle. Henriette Fouquier*. "Little Red Riding-Hood" we should have dubbed the small person who gathers the heavy folds of her crimson cloak around her, and smiles on us with cherry lips half-parted and liquid eyes brimming with fun; the little rounded cheeks are bright with rosy colour, and the whole picture is cleverly and daintily painted.

M. LOUIS BEROUZ braved difficulties when he selected the *Salon Carré* in the Louvre as a subject, and extraordinary is the feat he has accomplished, inasmuch as a group in the foreground is quite plastic, although it has PAUL VERONESE'S *Marriage of Cana* for background, whereas in the *Salon Carré* itself everything is lost in the plasticity of the PAUL VERONESE itself. M. BEROUZ has chosen the corner of the Salon Carré on the left as one enters from the Galerie d'Apollon; therefore we have before us not only the *Marriage of Cana*, by VERONESE, but VANDYCK'S *Charles I.*, and beneath it CORREGGIO'S *Marriage of St. Catharine*, as also part of RAPHAEL'S *St. George Striking the Dragon*. In the foreground is a group of visitors, consisting of a child in scarlet leaning against her mother covered by an Indian shawl, a girl in dark velvet, and some men who face the spectator, because they are gazing at VERONESE'S *Supper at Levi's*, on the wall opposite the *Marriage of Cana*. The golden glow on the old pictures is admirable, contrasted as it is by the harsher notes of colour on the garments of the nineteenth century visitors.

M. CAROLUS DURAN'S *Temptation of St. Anthony* is a failure. His ideas of legendary art are, to say the least, peculiar; so admirable a portraitist would do well to keep to the line of art in which he achieves splendid success. In his *Portrait of*

Madame H. he manifests his power of concentrating effect on the head and hands. The lady's dress is crimson, the background of the picture is red; but very cleverly are these tones pitted against each other with the sole object of leading up to the head, which is admirably given.

M. COT'S *Portrait of a Lady* in red, partially enveloped in a velvet mantle deeply furred with sables, recalls Sir PETER LELY'S style of portraiture. The lady is fair, her features are handsome. Spite the searching carefulness of details in the lights and shadows on the face, M. COT has successfully preserved his breadth of style.

A sculptor's work is M. FALQUIÈRE'S *Portrait of a Lady*. There is the delicate polish of marble on the lady's face, and the background conveys the idea of yellow clay laid on with a trowel. The painting of the crimson dress is carelessly got through, as though the management of colour were an unaccustomed task. We hardly understand how so great a sculptor should exchange the chisel he handles with so much genius for the brush with which his successes are doubtful.

Next to the sculptor's portrait is a life-like *Portrait of Madame de Reyterskiöld*; the lady is picturesquely clad in pale blue and delicate salmon satins, she wears a royal order on her shoulder. We congratulate M. EDELFELDT on the remarkable skill he has here shown in catching the style of the face as well as likeness in the pose of the figure.

M. ISRAEL in his *Enfant qui dort* maintains his power of expressing the mournful in low life. We have a mother seated near an oak table with her back to a window, by which gleams of dawning day, falling on the face of her sick child, reveal to us the weary night-watch of hopeless anguish she has passed. To the left is the deep fireplace suggestive of a Dutch home, with its flounced chimney-board surmounted by blue delf connoisseurs might covet. The veteran artist has lost in no degree his power of evoking sympathy. In his *Beau Temps*, fine though it be, he refuses to give us absolute sunshine. A boy and a young girl are walking by the edge of an extensive polder, from whose dank surface a blue grey mist rises, in which mysterious haze we discern cows grazing. M. ISRAEL is master of the atmosphere peculiar to his country; the grey powdery haze drawn forth by the action of the sun on lately submerged polders was never better painted. M. J. LE BLANT once more, and with his wonted spirit, brings before us an episode of the war in La Vendée. The bleus have gained a fresh victory. General CHARETTE, severely wounded, has been taken prisoner, and condemned to death. The execution takes place in the market-place. The day is dark, and heavy rain is falling. Troops fill the street leading to the "place," the firing-party stands at attention. The officer in command has crossed the square, and asks the general if he is ready. "Yes," replies the general, but a priest, his devoted friend, in an agony of grief has thrown himself on his breast. A rift in the clouds outside the picture falls on the wet foreground and on the general's white uniform. M. HÉBERT'S *Le Petit Violonneux* is an admirable work, and claims attention. The boy, sick and wan with cold and hunger, has wandered all day and played on his quaint old-fashioned instrument in vain. Fairly worn out, he sinks on a bench and sleeps. The child's parched lips are half open; his eyelids are heavy and swollen, his tattered cap scarcely covers his head, his jacket is thin and poor. The extreme pathos of this little picture is worthy of M. HÉBERT'S talent. *Le Petit Violonneux* is a *chef-d'œuvre*.

M. MESDAG exhibits two pictures. We believe that M. MESDAG inhabits Schevening. Certain it is that its quays, boats, and inhabitants invariably supply him with subjects. On a breezy day, expected by a crowd of fishwives and their children, three fishing smacks, low down in the water, with reefed sails, are coming in laden with fish. *Le Retour des Barques de Pêcheurs* is clever, as are all M. MESDAG'S works, but we prefer *Le Soir à Scheveningue*. This is a gem. Were the picture to consist only of its sky it would be an enviable possession, but besides a sky of deep cobalt, on which clouds reflecting the most delicate greys and rose-pinks convey, by the infinite gradation of their tones, a sense of unfathomable depth, there is the sea, on which the soft light of evening falls, and in the foreground a fishing-smack, to which a cart, driven into the water at low-tide, is bringing a supply of provisions. The canvas is small, but on it we have infinite space and marvellous beauty.

Les Deux Sœurs, by M. GIRON, is a work of vast magnitude. We confess that we wish it had been executed on a reduced scale. In front of the Madeleine a temporary block

prevents a pair of high-stepping bays taking a barouche one inch further on its way. Other carriages, and notably an omnibus, stop the way. An *ouvrier* and his wife, with their children, one of whom is in the father's arms, another carries the market-basket, while a third has in charge the family umbrella, attempt in vain to cross. The *ouvrier's* wife turns angrily round towards the barouche, the immediate cause of the stoppage, when beneath the lace parasol of its occupant she suddenly recognises her own sister, on whom she unhesitatingly lavishes epithets to which polite ears are scarcely trained. In the foreground on the right, unheeding the scene enacting at a few feet from her cart, is a *bouquetière*, who sells flowers to a lady and some children. The drama is well told; the colouring, varied and brilliant though it be, is carefully subdued; the drawing of the horses, of which there are several, is irreproachable. The work has immense merit. It is a vivid picture of Paris life *pris sur le vif*.

MR. STOTT paints children, dancing in a merry circle on a beach, and *Grandfather's Workshop*. In the latter the grandfather, an aged carpenter, enters his workshop unremarked by a little girl, who in his absence endeavours to use his plane. The old man watches the child with unfeigned delight, who, utterly unaware of his presence, thoroughly enjoys her temporary possession of the forbidden tools.

MR. SARGENT, an American artist, has painted young children at play in a drawing-room, panelled in dark oak. MR. SARGENT is a brilliant colourist, and has the merit of treating his subjects in a novel manner. M. ROLL has avenged the accusation, more than once made, that he was given to reproducing the same model, and invariably in half light, by a canvas which he floods with summer sunshine enjoyed by the family of a cottager seated on the steps of their house, as also by a cow, evidently the pet of the family, as turnip leaves and other dainties are spread in tempting array before her.

On M. HECTOR LE ROUX's *Holy Family in a Manger*, we regret that it is impossible to bestow the encomium that artist's works usually evoke. We question whether M. LE ROUX has treated the subject in earnest. If the reply to our inquiry be an affirmative, we can only regret the hideous realism to which that great artist has stooped.

Marvellous is the one patch of bright colour and the stream of golden light which M. PRINCETEAU has introduced in rear of his *Intérieur d'étable*. Some eight or nine splendid animals are lying down in their spacious stable, each the image of content and repose. A farm-boy has pushed open the red painted door at the furthest end of the building, and drives two cows to a vacant stall on the right. The ground is strewn with litter. A ray of sunny light flashes through the open door, and striking on the yellow straw, turns it to gold.

Carefully has M. MINET studied nature, as his *Pêche à l'épervier* proves. In mid-stream lies a boat, managed by a man in the stern and by a boy, whose business just now it is to pack the result of the day's work in a barrel in the centre of the little craft. The fisherman stands in the fore part of his boat. He has thrown the casting-net and is pulling it together before raising it, but he may cast it many a time unrewarded by success. On his countenance there is the peculiar expression of patient waiting habitual to his calling. The day is grey, the stream reflects the sombre hue of the sky, but deep dark green is the shadow of the boat on the water surface. The whole picture is done in a grey key, which, perhaps, is not the most pleasing. *En revanche*, M. MINET's *Pavots* are in sunny light, and blossoms and foliage are a blaze of brilliant but harmonised colour. We commend this *panneau décoratif* to the attention of decorative art students.

M. VALLON has been pleased to devote his talent, as REMBRANDT did his genius, to the delineation of raw meat. M. VALLON has entered his kitchen, and seeing a piece of *filet de bœuf* lying on the table near the iron *marmite*, straightway painted it. The colouring is fine, but we confess to a preference for his *Oiseaux du Midi*, birds of lovely hues lying in a basket—*ventres orange* and rose-winged *amaranthes*, soft grey *becs de corail* and red-beaked blue birds lying *pêle-mêle*, a mass of exquisite colour against a ground of intense darkness. The portrait of a fair child of some six summers is near these, by ACHILLE SIROUY, as well-known for his splendid lithographs of PRUDHON and other masters' works as for his paintings. The child's blue eyes, fair complexion, and golden hair, is set off by an enormous white hat; she is clad in pale blue, and holds roses in one hand and a pink doll

in the other. Toys lie at her feet. The portrait has been painted *in memoriam*, and has a poetry all its own.

M. JADIN's *Black Donkey*, who is making his way out of the canvas as rapidly as he can, is a success; deep snow has covered the earth, and the poor fellow is shivering with cold. M. JADIN's father was celebrated for his LANDSEER-like art of painting dogs. A small sea-piece by M. MONTENARD, which was exhibited at the Marltons, and in which the roseate light of the setting sun with the blue waters of the Bay of Naples were charmingly contrasted if somewhat exaggerated, is excellent. The same artist exhibits *The Transport "La Corrése" Sailing from Toulon*. It was remarked, and charitably, that a sea of as intense a tone of blue was never seen but in the Chinese waters; still, spite the dazzling and well-nigh painful brilliance of his colouring M. MONTENARD has the fibre of an artist: we feel tempted to utter the request of TALLEYRAND, "Du calme, s. v. p." M. LEHMANN paints veiled women; let us hope that beneath the lace, features of rare loveliness are concealed; why tantalise our sense of the beautiful? M. SCHENK last year typified the jury by a flock of geese gathered round an artist's picture overshadowed by an umbrella, but this year the same artist satirises the weaker sex. A flock of turkeys, with somewhat humanised countenances, are impeded in their progress across a hay-field by a lady's red crinoline, at which they fly with outstretched wings. M. SMITH-HALD paints the sea with a crisp freshness all his own; a fresh breeze is blowing in shore, the emerald water is dashed to white foam, in the picture entitled *Inquietude*, for the smacks are still far out to sea, and a group of anxious men and women watch their getting over the breakers. In *Le Matin à Cornvaal*, in Norway, we have a quieter phase of sea-coast life. In the foreground a mother and her boy are carrying a heavy basket of shell-fish, gathered on the vast expanse of sand at low tide. A line of fortifications run along the shore. M. MAKART's *Été*, as a decorative work, is worthy of the genius of the well-known Austrian master. Beneath a tapestried verandah by a riverside is a group of women in the picturesque costume of the Middle Ages, playing at a game while their sisters bathe, or repose on couches after having emerged from the water. The nude figures are remarkable for elegance of form, although in some instances the draughtsmanship might have been more careful. The flesh tones are delicate, the pose of each figure graceful, and the line of the draperies marvellous. The whole effect of the picture conveys a sense of beauty, of harmonised colour, and graceful design.

THE PARTHENON.*

THE popular notion of a Greek temple may be said to correspond with the representation of the building which an artist would give. The exterior is thought of as an assemblage of columns, a pediment, and sculpture. There is less certainty about the interior, for since artists have invariably refrained from showing more than the floor and the lower part of a temple, the popular imagination has never soared to the roof. Without light there could be no picture, but as it is always mysterious, no one has asked where the light came from which is thrown with so much effect on the figures in the painting of a classical subject when the scene is within a temple. The easiest way to get out of the difficulty of roofs and lighting is to say that in every temple a part of the roof was uncovered, and to leave it to individual judgment to decide what was the length and nature of the awning.

But when more precise information is sought obscurities beset us. The arrangements for lighting Greek temples appear to be connected with the roof, and the roofs have all disappeared. What is more remarkable is the absence in books of information respecting their construction, and especially in a work which professed to treat of building like that of Vitruvius. Under those circumstances it is no easy task to produce a work on the lighting of Greek temples, and it is only an enthusiast who would undertake the task of collecting the scattered fragments of information which relate to the subject. To understand the difficulty of Dr. Fergusson's work, we have merely to look at a list of architectural books. When we find that the subject has been passed over, we

* *The Parthenon: An Essay on the mode by which Light was introduced into Greek and Roman Temples.* By James Fergusson, C.I.E. D.C.L., LL.D., &c. London: John Murray.

may safely conclude that there was something in it which was sufficient to deter inquiry.

It lightens labour when one has a theory, which it is the object of research to verify, and Dr. Fergusson's may be inferred from the following statement of the conclusions which his essay is intended to uphold :—

1st. That, as a rule, all Grecian Doric peristylar temples were lighted by opaeons or clerestories.

2nd. That Ionic temples, except of the largest class, were generally lighted by windows, such as we would use when glass was not available.

3rd. That Corinthian temples were, as a rule, lighted by hypæthra or pseudo-hypæthra.

4th. That no temple in the ancient world, with the solitary exception of the Pantheon at Rome, was lighted by a horizontal, as contra-distinguished from a vertical, opening.

The evidence for this theory has to be taken from a wide field. Dr. Fergusson begins with a consideration of the lighting of Roman temples, in order mainly to guard the reader against the supposition that the arrangements resembled those in Greek temples. So far as is known the Greek mode was not adopted in a single instance by the Romans. That mode was so little understood among them that Vitruvius appeared to be unable to describe it properly, when he spoke of the temple of Jupiter Olympius at Athens. Dr. Fergusson, remembering the form of roof in the Indian cave temples, which he believes was derived from Western examples, concludes that in that temple the roof of the cella was also arched throughout its length, and that the light was introduced by a great window in an open courtyard, either through the eastern or the western wall. The temple of Diana, at Ephesus, is supposed to be another example of a building lighted by a great window at the end of the cella, but all the information respecting the temple which was derived from the recent explorations has not been made known.

In his second chapter Dr. Fergusson treats of pseudo-hypæthral temples, and he admits that it is impossible to give a mathematical demonstration of his theory owing to the condition of the buildings. One remarkable building described in this chapter is the Pretorium at Mousmeh, in which a large segmental window is still to be seen over the door, although both window and door were partly filled with masonry to secure a "dim religious light" when the building was transformed into a Christian temple. Another building is the Temple of Jupiter, at Baalbek, which hitherto has not been properly examined. In this case, Dr. Fergusson supposes that an attic existed for the purpose of lighting the interior, like one which is seen in a rock-cut model of a temple at Cyrene, and there are remains of the staircases by which the assistants were enabled to ascend to the velia, or shutters in connection with the great window.

In the third chapter ancient Greek examples are considered. Dr. Fergusson says he is still of opinion that the original inhabitants of Greece were Pelasgi, who had affinities with the Phrygians and Etruscans, and he doubts whether the men who warred at Troy were able to speak a word of the Greek language as it is now known. The Pelasgi favoured spiral lines on their ornaments, and they may have had more or less influence in the production of the Ionic capital, but the Doric column belonged to a different race, and may have been derived from Egyptian examples. In the primitive Doric temples the lighting was by openings which corresponded in position with the metopes of later temples. When the metopic openings ceased to be available, some other means of lighting was necessary. It would have been easy to have opened windows in the walls of the cella, but for some unknown reason the Greeks avoided interference with that part of their temples. Dr. Fergusson infers that the walls were generally covered with paintings. In this part of the essay attention is drawn to the temples at Ægina, Bassæ, and Pæstum. The peculiar plan which is found at Ægina is said to have been determined by the mode of lighting, which in this case was metopic. At Bassæ the interior Ionic columns (which, it will be remembered, have peculiar capitals) project into the cella, as if they formed a series of small chapels. But it is remarkable that they do not range with the Doric columns of the exterior, as the axis of each is in a line with the centre of the opening between the Doric columns. Dr. Fergusson claims this as evidence in support of his theory. There were, he says, windows in the roof, and as they were visible from the outside owing to the position of the building, a more sym-

metrical arrangement was required than at the Parthenon, where the roof was invisible unless from hills which were distant. At Pæstum the floor of the cella is about six feet above the level of the peristyle, and this is interpreted as arising from an attempt to make the columns of the interior reach the clerestory without being excessive in length or clumsy in style. Another peculiarity at Pæstum is the existence of stairs in the thickness of the walls, and which were evidently intended to be a means of communication with the roof.

The last chapter of Dr. Fergusson's book—to which the others are, as it were, preparatory—treats of the lighting of the Parthenon. As there is unanimity about the supremacy of the building among architectural works, it might be supposed that the various imitations of the temple would have given rise to many experiments in order to determine how the light was admitted to the interior. But it is with the exterior that modern architects are concerned; and as they have no practical or business interest in the arrangements of the cella and the treasury (inasmuch as nothing survives of those parts which can be adapted to modern use) speculations on lighting and roofing are supposed to be as profitless as, to a composer of modern operas, would be speculations on the dirges which the Fates chanted mournfully before the statue of the goddess. A great opportunity of testing theories of lighting, and on an adequate scale, arose when the Bavarian Valhalla was erected from the designs of Klenze. The exterior, although it stands on too high a stylobate, is a copy of the Parthenon; but unfortunately the interior was designed with as little thought of the original temple as ever entered the mind of a country builder when erecting a meeting-house behind a Doric "frontispiece." Will such another opportunity occur again of embodying all that is known or believed about the Parthenon? Dr. Fergusson turns wistfully towards the "Northern Athens," and suggests that the National Monument on the Calton Hill might be completed at the cost of some millionaire amateur, so as to reproduce the interior of the Parthenon, substituting, however, a colossal statue of Britannia for that of Minerva.

But what data is available for such a reproduction? Although the Parthenon was first among the glories of Athens, nothing has been discovered in Greek literature, nothing on a coin or a vase, to indicate how the temple was covered or lighted. When western archæologists were able to examine the ruins there was little left that might serve as a clue to the solution of the problem, and they may well be pardoned if their conclusions were so uncertain as to be mere guesses. Stuart, to whose enthusiasm Englishmen have reason to be grateful, said that of the three aisles into which he divided the cella the central one was exposed to the heavens, but unless we are mistaken it would not have been difficult to persuade him that the entire section need not have been unroofed. Cockerell followed Stuart, and of course carried Leake with him, but they were known to be so little steadfast in their opinion that Wilkins was able to suggest the likelihood of their renouncing Stuart's theory as readily as they renounced some others. In favour of a direct opening from the temple to the air may be urged the simplicity of the arrangement and its advantage as affording a capacious vent for the smoke arising from the sacrifices. But, on the other hand, it is incredible that a masterpiece of Pheidias which was made of ivory and gold, and the treasures which were deposited in the temple—and to a Greek they may have been of even greater value—should be left exposed to storms and rains, or with the uncertain protection of an awning. There are Germans who say that the opening was covered on wet days by bronze shields, which were rolled backwards when occasion required, but the mechanical difficulties attending this plan are very great. If it is said there were no openings in the roof, what other mode of lighting was available? The Periclean age, however great in literature and art, does not appear to have been remarkable for inventions in artificial illumination, and the lamps which were used in the temple probably gave no more light than those which are to be seen in continental churches. The entrance door from the pronaos could not always be left open in order to give light, for if so, the sanctity of the sanctuary would be diminished. It has been suggested that the roof may have been covered with thin slabs of Parian marble, by which means sufficient light was refracted to illuminate the interior, but the theory has not gained supporters. It may be doubted if even Ictinus could produce architectural effect and solemnity with a transparent roof.

The theory of Dr. Fergusson gives the advantages without the defects of a transparent roof. The light is supposed to be derived from openings in the roof, but as it is transmitted obliquely through vertical grilles to the cella the openings would not be apparent in the body of the temple, and an interior so lighted would be as effective as a church having clerestory windows.

Dr. Fergusson adopts the usual arrangement of three divisions in the cella by means of columns, and of having nine in each of the two rows. Stuart supposed there were two entrance doors to the cella at the ends, one opposite the other. Dr. Fergusson, following Botticher, has a central door and two side doors in the wall between the cella and the treasury, and corresponding side doors at the opposite ends of the aisles. Some difference of opinion has existed about the style of the columns which were used in the interior of the Parthenon. Stuart supposed that in the lower storey of the cella the columns were Corinthian, with Doric columns in the second storey, and he has Ionic columns in the treasury. Leake believed that the inner columns were Ionic. Dr. Fergusson has three storeys in the cella; in the two lower the columns are Doric, and for the upper or clerestory he uses the Corinthian order of the portico of the Temple of the Winds, which to some extent harmonises with the Doric, for the columns have no base mouldings. The columns in the third storey are carried up to the roof, and the bays are filled with the grilles, through which the light is supposed to enter the cella. The openings in the roof would be over the side aisles, and Dr. Fergusson found that in the model, which was constructed for him, a space 17 feet in length by 13 feet in breadth, on each side of the ridge, afforded sufficient light. The timbers of the roof are left exposed, and thus more room is given for the statue of the goddess, which is said to have been 40 feet high. As the total height of the temple was only 56 feet, if a flat ceiling were used, it could not be more than 5 feet above the helmet of the goddess, and the statue would seem too big for the temple. Another advantage of an open roof is that the peplos, or curtain, which was embroidered by the Athenian maidens, could be hung with better effect from the beams, and form a graceful canopy. It is suggested that the timbers of the roof were marked at the junctions by bronze ornaments, and if they and the grilles were gilded they would combine with the gold of the statue and the precious things of the same metal in the temple in producing unity of effect and richness worthy of the shrine of a goddess.

Dr. Fergusson finds use for the gallery which he assumes did exist behind the grilles on the third storey. It was probably, he says, set apart for women. His own belief is that "females, except as performers, were not admitted to take part in the Greek festivals, or did not, at least." It would be difficult to find authority for this assumption. The beautiful poem by Theocritus, of which a fine prose version has been given by Mr. Matthew Arnold, is by itself sufficient evidence that at the festivals the women were not separated from the men. Women who were for the greater part of their lives confined to rooms which were strictly guarded, took their share in the crush at the temple doors to see the spectacle within, and were not backward in bestowing abuse on the men who impeded their progress. In fact, it is supposed by scholars that young people utilised the services of the temples for opportunities to become acquainted. "Religious ceremonies and processions," says Professor Mahaffy, "were accordingly the common resort of young men, and, indeed, of girls, for more than religion's sake. It is well-known," he continues, "that among strict evangelical people in the present day, when the daughters of the house are forbidden balls, concerts, and other lawful amusements, matrimonial affairs are settled on the way to and from church, and at religious meetings. The parallel is very curious."

The access to the Parthenon galleries, which is seen in Dr. Fergusson's drawings, is by very steep stairs, and the sloping lines cut across the statue of the goddess in a way that is more suggestive of a workshop and lofts than of a temple. A crowd of women, wearing Greek shoes, could hardly ascend them without a good deal of clatter, and noise was never an incentive to devotion. There was probably some means of approach for the use of the servants of the temple, but Greek taste which elsewhere put the approaches out of sight in the walls, would be likely to insist on the concealment of the Parthenon stairs, and there would be no difficulty in interposing drapery between them and the statue.

In his preface Dr. Fergusson does not anticipate that his essay will be received with applause. "The work is," he writes, "a

strictly special one, on a subject in which very few take any real interest; while it is almost certain to prove offensive to specialists, from the novelty of the views it advocates, and the necessity of expressing them forcibly, in order not to be misunderstood." We must confess that when we began to read the essay we were not without prejudice against Dr. Fergusson's theory of lighting; but, after a study of its pages, our opinion has been modified. The explanations which had been given about the theory were necessarily brief, and were not accompanied by such evidence as appears in the essay. Erroneous conclusions were therefore inevitable. There is another reason which affects Dr. Fergusson's efforts to convince the public. If he had trusted solely to his vigorous pen to explain his theory, people might object to what he wrote, but they would be unable to say with confidence (as is now done) that such and such details are not Greek. It is a daring experiment to undertake even on paper to complete the Parthenon, and if the drawings had been less elaborate they probably would be more successful in supporting the theory. No one knows better than Dr. Fergusson of their shortcomings, and he plainly says that the grilles and other work which are prominent in his drawings can be improved. He is convinced of the unsurpassed excellence of Greek work, especially in comparison with the puny efforts of modern hands. Whenever he says "our investigations lead up to anything as perfect, or more so, than was ever done elsewhere in the same circumstances and with the same materials, we may be pretty sure it was very nearly the mode that was adopted by the Greeks. Nothing that we inartistic Anglo-Saxons can ever imagine will nearly realise the perfection of the glories of the Parthenon." A book which is inspired by so much reverence for Greek work deserves the most careful attention, and should not be neglected because it is supposed to represent a pet theory of the author. The subject is one which must be novel to the majority of English architects, and consequently there are few who are in a position to say whether Dr. Fergusson's conclusions are erroneous or the reverse. A book of this kind is not to be judged from a glance through the pages. Let the essay be carefully considered, and whatever may be the issue the study will be useful, for it is sure to dispel many erroneous notions about Greek temples.

PARIS NOTES.

THE Annual Exhibition of International Paintings was opened last week at the Georges Petit Gallery in the Rue de Sèze. Its object is to bring together the works of a limited number of eminent artists of various countries, and on this occasion France is represented by Messrs. A. Cabanel, Robert Fleury, and Hébert, members of the Institute; Belgium by M. Alfred Stevens; Italy by Signor de Nittis; Russia by M. Chelmonski; England by Messrs. Watts and Colin Hunter; Germany by Herr Liebl; Spain by Señor de Madrazo; Austria by M. Munkacsy; and the United States by Mr. Whistler. The exhibition is generally pronounced to be superior to its first and only predecessor in May last, and there can be little doubt that this International Exposition will become, as its promoters intended, an annual affair, while it will serve as an excellent pendant to the Salon.

The jury appointed to examine the designs submitted in the International Competition for the Médal and Diploma at the Amsterdam Exhibition have awarded the first prize for the medal to M. Daniel Dupuis, the French sculptor; the second prize to M. Ludwig Jünger, professor at the Amsterdam Industrial School; and the third prize to M. Alphée Dubois, of Paris. For the diploma, M. Georges Sturm, professor at the Amsterdam Industrial School, has carried off the first prize; the second being awarded to M. Ernest Acher, architect, of Brussels.

The Salon will be closed on Monday, Tuesday, and Wednesday in next week for the rearrangement of the paintings. The *Médaille d'Honneur* in painting will be voted on Sunday, for sculpture on the 22nd, and that for architecture on the 24th.

M. Julien Le Blant's painting, *The Execution of Charette*, has been sold to General Charette for 10,000 francs. The papers state that the young artist received several considerably better offers from other quarters, but preferred to dispose of his work to the family of the royalist hero.

It is announced that works which appear in the present Salon will be eligible for admission to the Triennial National Exhibition

to be opened in September next. This exhibition will be held in the Palais de l'Industrie, and not, as lately reported, at the Trocadéro.

On Sunday last, a free day, the visitors to the Salon numbered 40,544, while on Whit Monday they reached 42,500.

The Ministers of Public Instruction and Finance have just entered into a provisional contract with M. Nicole to let to him a large portion of the Park of St. Cloud, so famous for its picturesque beauty, together with the ruins of the château, for the almost nominal rent of 25,000 frs. per annum. A Select Committee was appointed to examine this arrangement, and it is unanimous in recommending its adoption. M. Nicole's proposal is to pull down what remains of the château, and with the materials thus obtained to erect a building similar to the Crystal Palace at Sydenham. The building is to contain art galleries, museums of curiosities, reading-rooms, gymnasiums, panoramas, and a cosmopolitan theatre, where will be played, in the words of the prospectus, "the dramatic works of all civilised nations, ancient and modern." The palace will be erected on the highest part of the site; it will occupy about eighteen acres, will be of rectangular shape, and divided into five naves. The front will be to the east—i.e., towards Paris; the length is to be 1,650 feet, and breadth 150 feet, with a vaulted roof and lofty central dome. Visitors are to be admitted three days a week at 5*d.*, three days at a franc, and on Fridays the charge is to be two francs. M. Nicole reserves to himself the right to give six grand fêtes annually. The committee estimate that the construction of the building will entail the cutting down of some 300 fine trees—a serious loss in the neighbourhood of a city which suffered so much in this respect during the war of 1870. The bargain, however, yet requires ratification by the Chambers.

Count d'Herisson, the well-known archæologist, has just returned to Paris from his latest exploring expedition in Tunis, bringing back with him a collection of relics that possess even more interest and value than those found on the occasion of his first visit. The most remarkable among them are two splendid mosaics from Carthage, the finest ever found in Africa, and said by experts to be worth at least 100,000 frs.

The Père de la Croix, the Jesuit who recently discovered the now celebrated Gallo-Roman remains at Sanxay, in the neighbourhood of Poitiers, paid a visit to the Chamber of Deputies a few days ago. M. Antonin Proust, Minister of Fine Arts in the Gambetta Ministry, whose love of art raises him above party and religious quarrels, escorted him through the Palais Bourbon, and even walked arm-in-arm with him in that part of the palace specially set apart for the Deputies, to the horror, it is said, of some of his Radical colleagues, who are reported to have looked on with surprise and indignation at this backsliding intercourse with a member of one, and that the most obnoxious, of the expelled religious bodies. The object of the reverend father's visit to Paris was to obtain an interview with the Prime Minister, and gain his support for the prosecution of the excavations and the preservation of the ruins already found. In this he is said to have been successful, as M. Ferry promised to seriously consider the matter, and has, moreover, called a special meeting of the Committee of Historic Monuments to consider and report to him upon the question.

The Society for Researches into the History of Paris and the Ile-de-France has held its annual meeting at the National Library, under the presidency of M. Jules Cousin, who gave some interesting details of the work of the society during the past year, and the progress of the Carnavalet Museum and Library, of which he is Conservator. A paper by M. Mareuse was read on the Roman arena in the Rue Monge. The council of twelve was then chosen for next year, all the retiring members being re-elected, with the exception of M. Gabriel Monod, who retired, and in whose place M. Auguste Vitu was named.

St. Giles' Cathedral, Edinburgh, is to be reopened on the 23rd inst., and by command of the Queen the Earl of Aberdeen, Lord High Commissioner, will be present on the occasion. Dr. William Chambers, at whose expense the restoration was carried out, is to receive a baronetcy.

The Bideford Town Council has agreed to pay in full the claim of Mr. Bryden, the architect first employed to prepare plans for the new market.

THE GREAT EAST RIVER BRIDGE.

THE great East River Bridge connecting the cities of New York and Brooklyn, and which is the most stupendous work of the kind yet constructed in America, will be opened on next Thursday. This bridge, which has been thirteen years in building, has cost about 15,000,000 dols. It is a suspension-bridge, supported by two towers standing up in East River 274 feet high and 1,595½ feet apart. The length of the bridge between the anchorages of the cables is 3,500 feet, and between the termini 5,989 feet. There are four cables, each having a solid section of nearly 145 square inches, and containing 1,732,086 lbs. of wire, with an estimated strength of 170,000 lbs. to the square inch, so that the four cables aggregate 6,928,346 lbs. of wire and 98,437,120 lbs. of strength. The aggregate weight of the bridge and its transitory load is estimated at 34,000 tons. It is 85 feet wide and 135 feet clear above the water in the centre of the span.

The correspondent of the *Times* in Philadelphia gives the following history of the bridge: William C. Kingsley and Henry C. Murphy, of Brooklyn, were the original projectors of this great bridge, which was regarded as a matter of importance to that city, especially in times of ice blockade, to secure a close and easy method of transit to New York. Mr. Kingsley conceived the project as early as 1865, selected the site, and hired an engineer to make a plan and estimates. Mr. Murphy was the President of the Bridge Trustees until last year, when he died, and Mr. Kingsley succeeded him. In 1867 the Bridge Company was chartered with 5,000,000 dols. nominal capital, 500,000 dols. being subscribed by prominent people, who organised the company and governed it until 1875, when the bridge was made a public work, and given in charge to the Board of Trustees. John A. Roebling was the engineer, and in 1867 made his plan and estimates, wherein the cost of the bridge proper was given at 7,000,000 dols., and the approaches 3,800,000 dols. He then thought the work could be completed in five years. Of this reported plan a board of the leading bridge engineers of the country made a critical examination and unanimously approved it. Congress passed an Act authorising the bridge in 1869, and the Secretary of War, in June of that year, gave it his approval as not impeding navigation, and the work was then ready to begin. The War Department, however, required 5 feet additional elevation for the bridge over that originally planned, making the clearance under it 135 feet, and it was also widened from 80 feet in the first plan to 85 feet. This added about 8 per cent. to the estimated cost. Other changes, in the construction of the approaches, which are of massive masonry instead of light iron trusses, as originally projected, and the foundations of the towers, which it was found could not be built on piles, as at first intended, swelled the cost to the present figure. The approaches are magnificent viaducts, their supporting archways being constructed for utilisation as storehouses, 400,000 dols. being set apart for putting fronts and floors in them. Another 500,000 dols. has been devoted to carrying the elevated railways over the bridge and providing stations.

The bridge construction was a work of enormous difficulty and constant delays, dissensions breaking out frequently, and the two cities being often at loggerheads; but the projectors kept steadily on, and ultimately surmounted every obstacle. The foundations of the towers were laid by the aid of huge caissons, the New York tower being built up from the bedrock 80 feet below the surface of the water, and the Brooklyn Tower from the clay 45½ feet below the surface. The Brooklyn caisson was got ready in May 1870, and the work completed in March 1871, a fire which necessitated flooding the caisson delaying operations for two months. The New York caisson was towed into place in October 1871, and sunk in position in May 1872. Engineer Roebling was the first victim of his great work, having crushed his foot and died of lockjaw in 1869. His son, Washington A. Roebling, has continued the work, although his personal presence has not been possible since the fire in the Brooklyn caisson, which gave him a strange disease affecting him ever since. Then the towers began slowly to rise, as the masonry was piled on the caissons. At 118 feet above high-water mark each tower is divided into three sub-towers by two avenues each 31½ feet wide. These rise 120½ feet further, above which the full towers are elevated 30 feet, with the saddle resting upon them that supports the bridge cables. In May 1875 the Brooklyn tower was finished, and in July 1876 the New York tower. The bridge floor is 118 feet above high-water mark at the towers and 135 feet in the centre of the span. The anchorages of the cables are 930 feet from the towers on each side of the river—huge constructions of masonry weighing 60,000 tons each, and covering a surface 119 feet by 132 feet. The cables are composed of 5,000 wires each (¼-inch wire). They are arranged in ropes, each containing 278 single wires, and 19 of these ropes in each cable, so that when bunched together the cable is about 16 inches in diameter. These wires were carried back and forward between the anchorages and over the tower, the work of stringing the wires beginning in June 1877, and being completed in October 1878. Once a bundle broke from the anchorage, darted across the tower, and fell into the river.

The bridge is divided into five parallel avenues, the outer two, each 19 feet wide, being for vehicles, and the central one, an

elevated road 15½ feet wide, for pedestrians. The other two avenues are for the surface cars for passengers, which will be moved across by means of an endless chain. There have been twenty persons killed in the work, and over 100 cases of caisson disease occurred. The approaches on the New York side begin at Chatham Square, and on the Brooklyn side end at Sands and Washington Streets.

MR. RUSKIN ON MR. BURNE JONES.

ON Saturday last Mr. Ruskin delivered a lecture at Oxford on Mr. Burne Jones and the Mythic School. Mr. Ruskin began by explaining the statement in his former lecture that Rossetti and Mr. Hunt were materialistic. By this term he meant to describe their stern veracity to material fact—their resolve to draw either what they see or what they suppose might have been the actual facts of the scene they desire to represent, irrespective of any conventional rules of picture-making. One great virtue of this veracity is that if the spectator has a belief in the scenes so represented, it enables him the better to realise his belief, while, if he has no belief, it makes him recognise his incredulity. It necessarily leads, also, to a completely substantial and emphatic way of painting, in which nothing is hazy or hidden or clouded round or melted away, and in which everything is examined in daylight, not dreamed in moonlight. Minuteness, though usually found with it, is not necessary to this style; such minuteness in landscape is Turnerian and Ruskinian, but not pre-Raphaelite. The really distinguishing characteristic is frank honesty of touch; and no better instance of the opposed vice could be found than Vandyck's *Miraculous Draught of Fishes* (680 in the National Gallery)—a picture which suggests the process rather of wiping the brush clean than of painting. But the former process is the more admired, for brown daubs still hang on the line in the best rooms of the National Gallery, while lovely Turners remain in the cellars, and might be buried in Pompeii for any good that will ever be got out of them there. The truth is that the Dutch painters, living all their lives, if rich, at court, if poor, in the pothouse, painted courtiers and potboys, but never Peter's face nor the truth of nature, and Vandyck (in the picture above referred to) contents himself with a wriggle of white paint to denote the sea. Exactly contrary is the method of the pre-Raphaelites, or much rather the pre-Rubensites, and for perfect example may be taken Mr. Millais's *Caller Herrin'* (exhibited last year), which in point of art should be put highest of all the works of the pre-Raphaelite school, and in which the artist has painted the herrings every bit as well as the girl, but without any fear that you would look at the herrings first. The materialistic painters are mostly concerned, then, with real persons in a solid world, and if there be a fault in Mr. Hunt's *Flight into Egypt*, it is that the souls of the Innocents are a little too chubby, and some of them perhaps a dimple too fat. In Mr. Burne Jones, on the other hand, the prevailing gift and habit of thought is personification; and where Rossetti painted Adam and Eve, Mr. Jones paints *A Day of Creation*. But the vital force of both schools alike lies in their truth. It is a most unfortunate abuse of language that has come to identify a myth with a lie. Archaeologists have been very busy of late in seeking to prove that all myths are temporary forms of human folly, but the myth of "Fortune and her wheel" is eternally true for all that, and there is more pure and practical morality in the myths of Pindar than in all the maxims of the philosophers. Mr. Ruskin thought his audience had reason to be proud of the fact that the man who, for indefatigable scholarship and inexhaustible fancy, and for the tenderness and largeness of his sympathy, stood far above all contemporary English designers, should have come from Oxford. In proceeding to the question how a myth should be represented in art, Mr. Ruskin felt himself rather beyond his sphere. It was his business to tell them how such and such a thing or person must be painted in accordance with natural and visible law; but he did not feel himself competent to deal with the appearance of *A Day of Creation* or the graining of Fortune's wheel. He was inclined, however, to think that a certain strangeness or quaintness or even violation of probability was not only excusable, but desirable, in the representation of what was neither body nor spirit nor animal nor vegetable, but only an idea. One rule, however, might be laid down for certain—namely, that no mystery or majesty of imagination can be any excuse for mere carelessness of drawing; but Mr. Burne Jones's work combined all that was purest and quietest in outline with all that was severest in light and shade. He named especially the designs for the Song of Solomon (the most important myth in the Old Testament) as being entirely masterful and showing drawing as tranquil and swift as a hawk's flight, and the outlines of the *Psyche*, the most precious things Mr. Ruskin has next to his Turners. Mr. Burne Jones had, too, a sense of colour perfect in its way, but he was essentially a chiaro-oscuroist rather than a colourist, being diametrically opposed therein to Rossetti. If all this be true, it becomes (Mr. Ruskin said) a question of some interest to ask why the painters of the mythic school—such as Carpaccio, Burne Jones, Watts—inspire peculiar dislike in most English people of a practical turn. In most cases the general

public either likes a picture pretty well, or at worst treats it with merciful contempt; but in this case, if they do not enthusiastically admire, they dislike a mythological picture as if they were personally aggrieved by it. These good people will admire, and rightly admire, a clever picture of a child with a doll; but after all, however cleverly your child may be painted, it will always be better to look at the child himself. But you cannot see Athena, the spirit of Wisdom, if you would; and perhaps you would not like it if you could. The painters of the mythic school are in the most solemn sense hero worshippers, and their aim is the brightest and noblest possible, for they at least teach us that "all great art is praise."

THE CHAPTER-HOUSE, WESTMINSTER.

THE subscriptions to the Dean Stanley Memorial Fund amount to 5,200*l.*, which, after furnishing the effigy and tomb, will provide for three of the five windows in the Chapter House that are still unfilled. These Messrs. Clayton & Bell have been instructed to proceed with at once. Two windows are already completed—one presented by the late Dean himself, the other given by the Queen in memory of him. They suffer at present from having to face the light of the plain-glass windows opposite. The designs for the six large windows are all similar, being historical and consecutive in their subjects, while the seventh window, which is smaller, continues the series with as little alteration of design as its dimensions allow. The plans for all seven were worked out with the collaboration of Dean Stanley himself, who entered into the particulars of the historical scenes to be represented with the most painstaking care. Each of the six large windows is divided perpendicularly into four sections, surmounted by a large circle, these sections again being divided horizontally into three compartments each. The four upper compartments in each window are, according to the plans, to be filled with the figures of English Kings, the lower with the figures of Abbots of Westminster, and the central with historical scenes connected with the Abbey. The large circle in each window contains the figure of some literary or other representative of the period. In Dean Stanley's own window the spaces are thus filled up—in the circle, Anselm; in the Kings' compartments, William I., William II., Henry II., and Richard I.; in the historical compartments, the Coronation of William I., the Legend of St. Wulfstan and his Crozier, the conflict of the Archbishops of Canterbury and York, and the Crusaders gathering under Richard I. In the lowest compartments are the figures of the Abbots Geoffrey, Vitalis, Giblebery, and Lawrence. In the Queen's window are Roger Bacon in the circle; the Kings John, Henry III., Edward I., and Edward II.; historical scenes—the Signing of Magna Charta, Henry III. building the Abbey, Edward I. and Eleanor with the Prince of Wales hanging up the Crown of Llewellyn, and the bringing of the Stone of Scone to Westminster Abbey; Abbots—Papillon, Berking, Wenlock, and Kirklington.

We come next to the three windows which are now to be taken in hand. In the first of these Chaucer occupies the circle, the other spaces being filled as follows: Kings (or royal personages)—Edward III., Philippa, the Black Prince, Richard II.; historical scenes—Abbots and Monks assembled in their Chapter-house, House of Commons with Speaker, the Black Prince carried into Parliament, Richard II. consulting the Hermit before meeting Wat Tyler; Abbots—Henley, Byrcheston, Cardinal Langham, Littleton. The second of the new windows will be composed as follows: In the circle, Caxton; Kings—Henry IV., Henry V., Henry VI., Edward IV.; historical scenes—Death of Henry IV., Henry V.'s Council, Henry VI. choosing his grave in Westminster Abbey, Elizabeth Woodville with the Duke of York taking refuge in Westminster Abbey; Abbots—Colchester, Kyrtton, Milling, Esteney. In the third new window there will be the following Sovereigns: Henry VII., Henry VIII., Edward VI., Mary; historical scenes—Marriage of Henry VII., Wolsey's Convocation in the Chapter-house, Dissolution of the Monastery, Funeral of Edward VI.; Abbots—Islip, Benson, Thirlby, Feckenham. One of these windows has been subscribed for exclusively by friends in the United States.

There still remain one large window and a smaller one to be provided for. The large window, if funds are forthcoming, is to be composed in the following manner: In the circle—Bede; in the royal compartments—Lucius, Sebert, Edgar, Edward the Confessor; historical scenes—Foundation of the Abbey on Thorney Island, St. Peter and the Fisherman, St. Edward and the Treasury, St. Edward's Funeral; in the abbots' compartments—High Priest of Apollo, Orthbright, Wulsin, Edwin. The small window is to contain Queen Victoria in the large circle; the royal arms, and the deanery and Dean Stanley in two smaller circles; and Elizabeth, James I., Charles I., and William III. in four compartments below. The erection of these two remaining windows will require an additional 1,200*l.*, and the committee hope that private munificence may step in to complete the great work which is, happily, now so far advanced, and thus accomplish in full the earnest desire of Dean Stanley.

NOTES AND COMMENTS.

A DECISION has been given in the Irish Court of Exchequer, after much deliberation by the judges, which may have interest for the timber trade. A builder in Londonderry ordered a cargo of bright spruce deals from a timber merchant in North America. When the deals arrived it was said that they were not of the right description, and not only were they rejected, but an action was taken by the builder against the merchant for breach of contract. The merchant, in defence, relied upon the fact that, at the time of shipment, the timber was passed by the official surveyor of the port as bright spruce deals. The builder, in reply, filed a replication alleging that, notwithstanding the official record, the deals were not of the stipulated quality, and were not merchantable. The question for the decision of the Court was whether, on the terms of the contract, the plaintiff was bound to accept the goods, they having been classified as coming within the required description by the official surveyor at the time of shipment. Judgment has at length been given, and it is in favour of the timber merchant. The report of the official surveyor has been held to be a sufficient criterion of the character of timber. With this opinion few experts will be found to agree.

THE ingenious Americans, who have been so successful in producing machines by which many kinds of labour become unnecessary, are turning their attention to architecture. What is an architect but a "help," who labours at drawings and specifications?—and to the American mind it would be an economy to dispense with him. At present an architectural machine is not to be bought, but there are efficient substitutes for it. A man who is about to erect a house finds among the announcements of patent medicines in his newspaper that a firm in New York are ready to supply him with "a complete set of plans, specifications, working drawings, &c., for houses to cost from 500 dols. to 2,500 dols., designed and drawn up by experienced architects, from 5 dols. upwards." It would be interesting to know where the "experienced architects" were discovered. Are American architects willing to sacrifice their own interest to the national passion for "dodges"? It is more likely that the wonderful prize-packet is a compilation. English architects may, however, have innocently contributed to its production. Occasionally an American gentleman calls on London architects and asks for sketches of houses, as he is about to build, and is "desirous to combine English and American plans." It is not unlikely that the visitor is a commercial agent, and that the sketches are utilised for the new system by which every man can become his own architect on the payment of five dollars.

THE clause which enjoins that the plans for buildings in Northumberland Avenue are to be approved by the Institute of Architects is evidently supposed to be a matter of form which was invented for the purpose of giving a little pleasant work in Conduit Street. The plans of the "Hôtel Métropole" did not meet with the approval of the Institute Committee of Good Taste, but the Metropolitan Board of Works did not think it necessary to put the tenant to the expense of carrying out the vague alterations suggested by the representatives of the Institute. Before the plans were submitted the works at the hotel had been commenced, and under those circumstances it was the duty of the Institute to have declined an examination of the drawings. By its own act the Institute has shown that it is willing, for the sake of recognition, to take part in a performance that is but a sham from first to last.

THE Roman road which traverses England is for a great part of its length known as "Watling Street." Many attempts have been made to discover the origin of the name. In towns like Dublin, where there is a Watling Street, the ordinary explanation given is that rafts of wattles were used to cross a river or stream near the street. But the explanation would be altogether inapplicable to a Roman road. Dr. HOPELL has taken some pains to investigate the subject. He says that "Watling Street" seems to have had originally a British signification, and the most reasonable explanation appears to be that which makes it a corruption of "Gwyddelig," British for "sylvan," savage. It may be said that the word "Gwyddelig" does not look much like the word "Watling," but they are not so far apart in sound. Besides, the "G" was

dropped after such words as "to" and "from," and "Watling," in old documents, is actually found written "Gwatling." It is also found written "Guethling," a very near approach to "Gwyddelig" in which word the "dd" is pronounced as "th" in "this." A confirmatory argument may be thought to be found in the fact that "Gwyddelian" signifies, in the British language, "an Irishman," from which circumstance Dr. STUKELEY thought the Watling Street had derived its name, as being "Irish Street"—"the highway that led to Ireland"—a description which would apply more correctly to the southern portion of the Watling Street. Another derivation has been suggested by Mr. A. J. GODLEY, of Balliol College, Oxford, namely, "Gwaith y Lलग"—"The Work of the Legion."

DR. ARTHUR MITCHELL lately delivered a lecture in Edinburgh in which he summarised the characteristics of Celtic ornament. There were, he said, three principal patterns in the surface decoration, viz., interlacements, angular frets, and a pattern formed of diverging spirals. The first two appear in other styles of decoration belonging to other countries. The third, which is the most beautiful, is purely Celtic, and has been used only by the Scots—Irish Celts. The three in combination, however, really form what is known as Celtic decorative art; and so combined they produce a style of decoration emphatically national. It was an art of the Christian period, and was used chiefly in the decoration of objects related to the Christian worship or faith, such as manuscripts, crosses, croziers, shrines, chalices, &c., but it was also used to decorate such things as personal ornaments, armour, horse-trappings, &c. The forms given to the objects decorated were decidedly good, and they were forms which were suitable for receiving such a decoration. The decoration was aided by the use of colour when possible, and in the case of metal work by enamelling and jewelling. The art probably came to Scotland from Ireland. The best work in the manuscripts and metals occurs in Ireland, but the best work in stone occurs in Scotland.

MR. HEAPHY, the engineer of the Phoenix Fire Office, whose excellent rules for arranging the apparatus required for electric lighting were lately published in *The Architect*, has demurred to some recent utterances in Parliament with respect to the danger of electric lighting. The light is supposed to be unsuited for the National Gallery and the British Museum. Mr. HEAPHY says it is true that if electrical installations are carelessly or ignorantly arranged, there is very great danger, indeed, to be apprehended; in fact, a fire is almost certain sooner or later to occur. But, on the other hand, an installation of the electric light, if specially arranged and properly supervised, can be put up in such a manner as to render any risk of fire so slight that it would be a gross injustice to make it an excuse for depriving the working-classes of that recreation and enjoyment in the evening they stand so in need of. It may, perhaps, reassure timid people to know that the Phoenix Fire Office rules for electric lighting have now been in operation for nearly a year and a half, and that not a single instance of fire has yet occurred in any installation that has been put up in compliance with them.

A WRITER in *Nature* has called attention to the errors to be seen in Academy pictures which represent natural phenomena. As regards landscape, he says there never was a year in which there was such an absence of works of the highest order, and some of them are mere misrepresentations and distortions of nature. In one of these landscapes a rainbow is introduced. A physicist is not surprised when he sees rainbows in which the order of the colours is reversed, or when a rainbow, which must always appear to form part of a circle, is painted in perspective. But this year there is a more wonderful invention. Forgetting that the order of the colours is fixed by an unalterable law, and that it is from red through orange, yellow, green, blue, indigo, to violet, the artist has introduced the violet in the middle. It is often said that the artists of the present day are too prone to copy what they see out of doors, and that in consequence their works show no signs of imagination. But in what part of the country did the artist referred to see his wonderful rainbow? He could hardly have taken it from nature, and yet his work is supposed to be most exact in its accuracy.

ILLUSTRATIONS.

SALON, PADDOCKHURST, SUSSEX.

WE publish this week a view of the *salon* at Paddockhurst, which was promised when the *porte-cochère* and exterior view of the building were illustrated on February 17.

The mansion was originally designed by Mr. A. SALVIN, and the additions have been carried out under the direction of Mr. ARTHUR CAWSTON, Architect, of 9 Spring Gardens, S.W.

CONTINENTAL SKETCHES.

THIS illustration is an ink photo reproduction of sketches by Mr. LETHABY, whose water-colour drawings are as beautiful as his etchings.

WALL PAINTING IN THE PANTHEON, PARIS.—III.

MUSEUMS.*

BY J. O. SMITH.

(Continued from page 324.)

THE general arrangement of the Natural History Museum has been described by the superintendent as follows :—

"I may finally refer, in the terms of our modern phylogenists, to the traceable evidences of 'ancestral structures.' In the architectural details of the new Natural History Museum you will find but one character of the primitive and now extinct museum retained, viz., the central hall. In Montague House there were no galleries, but side-lighted saloons or rooms of varying dimensions and on different storeys. In its successor, the museum developed on its site at a later period, we find galleries added; that, for example, which was appropriated to the birds and shells being 300 feet in length. This architectural organisation still exists at Bloomsbury. The museum, which may be said to have budded off, has risen to a still higher grade of structure after settling down at South Kensington. In its anatomy we find, it is true, the central hall, and long side-lighted galleries; but in addition to these inherited structures we discern a series of one-storeyed galleries, manifesting a developmental advance in the better admission of light, and a consequent adaptation of the walls as well as the floor to the needs of the exhibition."

Not far from this splendid building is a popular and interesting miscellaneous collection of objects, which have been accumulating from time to time since 1855. The building in which they are housed was originally a temporary structure, known to the irreverent lover of alliteration as the "Brompton Boilers." Permanent buildings have been gradually erected, and are now in progress, but in them we miss the full development of the principle of classification, and galleries devoted to special subjects, found in the design for the Natural History Museum. In place thereof there are, as you know, three very large and lofty courts. One—the architectural court—is divided into two equal parts by a two-storeyed arcade; the other two have aisles or cloisters on all four sides, the south court having also a central arcade of two storeys. On the first floor, over these aisles or cloisters, are ranges of galleries chiefly used for the exhibition of paintings.

Adjoining the cloisters, on the ground-floor, are offices for the staff, an art library and reading-room. On the north-west side of the quadrangle, of which the large courts form the east side, are the schools and official residences, portions of the ground-floor being available for exhibition purposes, and lighted by windows looking into the quadrangle; on the south side are new buildings, intended for the library, &c. Across the centre of the quadrangle runs a corridor, off which are spacious refreshment and retiring rooms, elaborately decorated and fitted up, in striking contrast to the much inferior accommodation provided in the Natural History Museum, and already referred to. Over this corridor and refreshment department is a long gallery and lecture theatre, this last again being far superior to the one spoken of over the way. This ever-extending national collection has, in addition to the buildings already named, taken possession of some of the permanent exhibition galleries erected round the Royal Horticultural Society's gardens, and will probably also in time be increased by a handsome pile of buildings to be erected upon the vacant site at the corner of Exhibition and Cromwell Roads. If this be ever realised, it is to be hoped the system of large courts and semi-dark aisles may not be strictly followed, but that some attempt will be made to facilitate the arrangement of kindred objects in single galleries in such position that they may be seen to the best advantage. At present the buildings at South Kensington Museum teach many valuable lessons to the student of what to do and what to avoid doing. The large courts being top-lighted only at a great height, the arcades are necessarily imperfectly lighted; the least satisfac-

tory room for exhibition purposes in the Natural History Museum, although in appearance an architectural gem, is the saloon for British natural history on the ground-floor, and this is arranged with arcades and a central top-light similar to the large courts to which I am referring. Three of the arcades have side-lights, but owing to structural obstacles this form of lighting is only effective on one side. This weak point has been rendered much more apparent in the British saloon by the arrangement of the fittings and the desire to exhibit more objects than the room was designed to hold; but still it is evident from these two examples that aisles arranged as at South Kensington Museum are points to be avoided if possible.

Top and side-lighting have just been incidentally referred to, and it might be convenient at this point to consider the very important subject of lighting generally. The vexed question of top *versus* side-lighting is really solved by other than abstract considerations of the relative fitness of the two systems. So far as I know there is no museum in existence in which either system is used exclusively. Convenience or economy decides in favour of both, and under the most favourable conditions experience shows that the happy medium between the two gives the most desirable result. A visit to the National Gallery, British Museum, or any similar building with large lighted areas, will clearly show that complete success is not attained by flat top-lights. On the other hand, side-lighting has its disadvantages, even when a gallery is lighted on both sides as the Natural History Museum. When side-lighting is adopted the light should be admitted as near the ceiling as possible. A comparison of the three modes of admitting light may be made at either of the museums to which I have referred. So far as I have been able to compare them, the northern galleries at the Natural History Museum would appear to be the most successfully lighted galleries in any of the three museums. In these the light is admitted through a continuous line of slightly raking sashes just above plate level; practically they are side-lights placed high up on both sides of the galleries. Cheerfulness and ventilation are aided by a range of lights in each gable end. It is difficult to insure that every portion of a large building shall be well lighted, but it is well to bear in mind that unless objects can be seen the space they occupy will be much less valuable than it would be if they could be shown to advantage. On the other hand, it is undesirable to overlight a gallery, to expose unnecessarily the inner air to the chilling influences of skylights, or to increase the reflection from light objects to such an extent as to interfere with the comfort of the visitors or students. To give additional emphasis to this lighting question for small museums I am constrained to quote the published opinion of a scientist upon museum building generally :—

"In the construction of our local museums the scientific man has unfortunately seldom, if ever, been consulted as to the practical wants of the curator or lecturer; but the entire design has been left to the architect, who, as a rule, is perfectly in conversant with scientific requirements, and thinks it beneath his dignity to confess as much and seek the advice of those who could aid him; while, guided by the instincts of human nature, he throws all his thought into 'general effect,' especially over the exterior, which will be a standing advertisement of his architectural ability to those who are town councillors, not naturalists."

After criticising in detail two well-known provincial museums, he concludes thus :—

"In building any local museum, the first effort ought to be to produce a shell, fitted with the most convenient arrangements human ingenuity can devise for the wants of curator, teacher, and student; and when that has been accomplished, then devote any surplus funds to the external ornamentation of that shell in any manner good taste may direct, as long as the design will not interfere with the effective lighting of the several departments; at least this is the naturalist's, if not the architect's, view of the question."

The South Kensington Museum and the reading-room at the British Museum have now been lighted for some time by the electric light, with an amount of success which will probably cause it to be used in future for similar large areas. At the Natural History Museum branch gas has been introduced into the basement and central hall; but at present the galleries, studies, &c., are closed at dusk.

Fittings.

The form, position, and size of the cases and fittings to contain or protect the specimens should be well considered, and arranged in such a way as to favour and facilitate the classified arrangement of the exhibits. The nature of the specimens will determine the kind of case or fitting, and the position, size, and number of fittings should determine the extent and plan of the galleries. The fittings appropriate for museums may be seen in great variety at the British Museum, where experiments to obtain security and to preserve specimens from dust have been tried, regardless of expense. At the South Kensington Museum, where more economy has been practised, with rather gloomy results in some of the earlier stands, the recent fittings are more successful in producing a pleasing exterior. The fittings at the Natural History Museum have been designed by Mr. Waterhouse, and are placed in positions specially arranged to receive them. Some have been

* A paper read at a meeting of the Architectural Association on the 4th inst.

executed in metal, but most of them are in mahogany; the doors are ebonised and strengthened by metal plates. Some of the galleries are fitted with table-cases brought from the British Museum. The wall-cases in the northern galleries are arranged in bays about 17 feet long, while at the British Museum they are continuous; the former are found in practice to be less convenient for classifying the specimens. The side-lighted galleries have pier-cases at right angles to the windows on each side of a central gangway, about 15 feet long by 10 feet, and 12 feet high, and of various depths. The coral gallery is fitted with cases glazed on both sides, with glass shelves for the specimens. At South Kensington Museum the cases vary considerably in size, shape, and appearance, and are made portable. The British Museum is fitted chiefly with continuous wall-cases of mahogany or metal, and the floor space occupied by table-cases and stands of a uniform type.

Materials.

Materials for museums should be selected for their durability, appropriateness, and cleanliness. As it is always inconvenient to disturb a carefully-arranged gallery for cleaning purposes, to say nothing of the risk of damaging the specimens, the internal surfaces should, as far as possible, be of a non-absorbent permanent character, which would not require frequent renewal or cleaning. The sombre effect produced by London atmosphere upon the exterior and interior of the British Museum buildings would seem to suggest the desirability of avoiding plaster and stone in favour of more cheerful materials. Experiments of a totally different character have been tried at South Kensington in the other two museums under consideration. The iron construction of the courts with the mosaics in the bays at South Kensington Museum are certainly more cheerful, if not so dignified, as the solid masses of dark material at the older institution. So also the terra-cotta interior and exterior of the Natural History Museum presents a very pleasing and interesting (possibly on account of its novelty) surface to view, and one admirably adapted for external use at any rate, especially when designed with so much common sense and intimate acquaintance with the material as is displayed in the details of the whole of this work. The oak floors of the older museum have been adopted generally in the new offshoot in the Cromwell Road, and are far better than the too smooth tile pavements over which one has to slip painfully at South Kensington Museum. These pavements are as inappropriate for their purpose as the highly-polished stands upon which the stuffed monkeys and other lively creatures are placed by the score in the British Museum cases. The central hall and corridors of the Natural History Museum are floored with Messrs. Burke's mosaic pavement, and the entire area of the basement floor is covered with Seyssel asphalte. All the floors are of fireproof construction, and the roofs of iron covered with slate. The idea of using terra-cotta for this building was originated by Captain Fowke, and the result is thus enthusiastically referred to by Professor Owen, at the meeting of the British Association at York in August 1881:—

"In the construction of a building for the reception and preservation of perishable objects, the material should be of a nature that will least lend itself to the absorption and retention of moisture. This material is that artificial stone called terra-cotta. The compactness of texture which fulfils the purpose in relation to dryness is also especially favourable for a public edifice in a metropolitan locality. The microscopic receptacles of the soot particles on the polished surface of the terra-cotta slabs are reduced to a minimum; the influence of every shower in displacing those particles is maximised. I am sanguine in the expectation that the test of exposure to the London atmosphere during a period equal to that which has elapsed since the completion of Barry's richly-ornamented palace at Westminster, now so sadly blackened by soot, will speak loudly in favour of Mr. Waterhouse's adoption of the material for the construction of the National Museum of Natural History."

Warming.

Museums probably more than any other kind of buildings require the interior atmosphere to be maintained at an even, regular temperature, and quite independently of the variation which may take place outside. This is not only essential for the comfort and health of the staff, students, and visitors, but is absolutely necessary for the preservation of the most delicate and sensitive specimens. The variation of a few degrees has been known to produce the most interesting changes in the condition and appearance of certain minerals. In a building where light is all-important, and large lofty windows are numerous, where top-lighting is considered as a primary desideratum and skylights abound, it may readily be conceived that the maintenance of an equable temperature inside a building separated to a large extent from our outer variable climate by glass only is a task requiring much experience and accurate judgment to accomplish successfully. The difficulty does not lie so much in obtaining the necessary heat as in judiciously conducting or disposing of it when obtained. One is tempted frequently to aver that buildings of this class are usually overheated. The three buildings previously referred to are all warmed by the air coming in contact with hot-water and steam-pipes. In the South Kensington Museum, I

believe, the pipes are carried through the galleries and courts on the floors, and the building warmed throughout by direct radiation from them. In the other two the problem is solved by admitting fresh warmed air from the basement up into the galleries, supplemented as required by hot-water or steam-pipes to assist the warmed air to circulate. In the most recently-erected building the hot-water pipes, with a few minor exceptions, do not rise above the basement floor, but are arranged under this floor in channels running parallel with the main walls of the front galleries, and under large shafts leading to the centre of the back or northern galleries, cold fresh air is admitted to the channels, and exits are provided from them to 14-inch square flues in the walls, which conduct the warmed air to the upper floors. The hot-water pipes are arranged in the channels in three tiers of five in each tier, and amount altogether to about 28,000 feet run of 4-inch pipes, including three large coils under shafts leading to the central hall. To heat the water in these pipes there are thirteen steam-chests or heaters disposed at points shown on the plan, which are supplied with steam from three twenty-horse-power boilers, situated under the British saloon on north side of the central hall. The warmed air in travelling up the shafts to the top storey becomes reduced in temperature about one-half, but steps are being taken to reduce the loss of heat to a minimum. The cold air is filtered through canvas screens as it enters the channels, and the channels and flues are rendered in cement on the inside. The warmed air is admitted to the galleries at the floor level through galvanised iron gratings. Provision for ventilation is made by flues in the walls opening to galleries at ceiling level, leading to turrets and towers. The large smoke-shafts on the north side of the building are also used for ventilating the galleries.

In concluding these imperfect notes I would fain confess to feeling a patriotic satisfaction that the national collections of artistic, scientific, and natural history treasures should be so well cared for and so generously displayed in buildings specially designed to receive them. The buildings now in the course of erection upon the Bloomsbury site and the gradual extensions going on at South Kensington Museum indicate the necessarily progressive nature of these institutions. We may hope to see—probably at no far distant date—the full development of that which Professor Owen styles the "higher grade of structure" into a more complete architectural organism than it has yet become.

One may be permitted to hope, further, that as these vast structures grow increasingly valuable as depositories of knowledge, they may at the same time become more and more important factors for educating and humanising the community at large.

The PRESIDENT said that the subject of museums, now for the first time, he believed, brought before the Association, was one of much interest, though doubtless few among them might be called on to take part in planning or arranging such a building. The new Natural History Museum at South Kensington had been selected by Mr. Smith as a typical instance. It was the largest and the latest of the kind in the country, and might well be taken as a model of what such institutions should be in plan, arrangement, method of lighting, &c., and which, moreover, had been designed by an architect experienced in his art. The opinion of a scientific man quoted by Mr. Smith, that architects followed simply their own judgment in designing a museum, was sheer nonsense. The requirements of such buildings varied in different instances, and the architect must have the fullest possible statement of what the requirements were.
